SUMMARY

The synthesis of four 3,3,3-trifluoroprop-1-ene telomers ($R_F-(C_3H_3F_3)_nI$, $n=1, 2$, $R_F = n-C_6F_{13}-$ or $(CF_3)_2CF-$) and their allyl derivatives $R_F-(C_3H_3F_3)_nCH_2CH=CH_2$ are presented. The allyl telomers were prepared by a three-step reaction. The first step involved the thermal and peroxide- induced bulk telomerization of 3,3,3-trifluoroprop-1-ene (TFP) with heptafluoro-2-iodopropane or tridecafluoro-6-iodohexane leading to monoadduct and diadduct, the ratio of which depends on the $R_0 = [R_F I]_0/[TFP]_0$ initial molar ratio and the reaction temperature. The amount of monoadduct increased up to 50-60 % and of the diadduct to 25-30 % at temperatures up to 180 °C (thermal-initiated) and 150 °C (initiated with di-*tert*-butyl peroxide, DTBP), R_0 up to 1.5. It was observed that the addition of the $(CF_3)_2CF^\bullet$ radical onto the $=CH_2$ of TFP was regioselective

leading to selective formation of a single isomer in contrast to the addition of the n - $C_6F_{13}^\bullet$ radical. Then, the telomers reacted with allyl acetate yielding $R_F(C_3H_3F_3)_nCH_2CH(I)CH_2OCOCH_3$ ($n=1, 2$) in 50-80% yields. The third step consisted of a deiiodoacetatization of these iodo-acetates into $R_F-(C_3H_3F_3)_nCH_2CH=CH_2$ (C,n) giving 50-80 % yields. All the intermediates were characterized by ^1H , ^{19}F and products by ^{13}C NMR spectroscopy.

KEY WORDS: 3,3,3-trifluoroprop-1-ene; Radical addition; Perfluoroalkyl iodides; Thermal and peroxide telomerisation; fluoroallylic monomer; ^1H , ^{19}F and ^{13}C NMR spectroscopies.

I. INTRODUCTION

Telomerization of 3,3,3-trifluoroprop-1-ene (TFP) with various transfer agents was pioneered by Haszeldine after its synthesis in 1951 by dehydroiodination of $CF_3CH_2CH_2I$ ¹⁻³ (Table 1). Various ways of initiating the telomerization were investigated. The photochemical or thermal addition of HBr or CF_3I to TFP yielded exclusively $CF_3CH_2CH_2Br$ or $CF_3[CH_2CH(CF_3)]_nCH_2CHICF_3$, respectively. Low et al.⁴ investigated this reaction under UV radiation at various temperatures and obtained a mixture of normal and reverse isomers for the monoadduct. They observed that a higher proportion of products of reverse addition was formed at higher temperatures and the formation of higher adducts at ca. 175 °C. In addition for other transfer agents, diiodoperfluoroalkanes, silanes, phosphonates, disulfides react with TFP, yielding the monoadduct predominantly (Table 1)⁵⁻¹².

Insert Table 1

Pertinent studies of TFP telomerization were performed by Russian teams using initiation with a peroxide or γ -rays (Table 1). Terentev et al.⁹ studied the cotelomerization of TFP with 2-methyl-1,3-dioxolane and obtained cyclic telomers accompanied by rearrangement of transient radical intermediates by 1,5 -H migration. Zamislov et al.¹³ used C₁-C₄ alcohols as telogens in TFP telomerization under γ -irradiation to get different fluoroalcohols. Vassileva et al.¹⁴⁻¹⁹ used different telogens such as C₆H₅CH₂Cl, CBr₄, CHBr₃, CH₂Br₂ (but not CHCl₃ and CBrCl₃) with the initiating system Fe(CO)₅-DMF or hexamethylphosphoramide (HMPA) (Table 1). In the presence of Fe(CO)₅-DMF, a radical mechanism was proved to take place and chain transfer constants of the telogens involved in telomerizations were determined. Keim et al.¹⁶ studied the transition-metal-catalyzed C-C coupling reaction of TFP with CCl₄ in the presence of copper salts and obtained new telomers.

Systematic studies of telomerization reactions of fluorinated monomers, in particular fluoroalkenes, with various transfer agents were performed by Ameduri and Boutevin, published in several papers²⁰ and more recently collected in a book²¹.

Two patents^{22, 23} of Pennsalt Chem. Corp. claim the production of fluorinated organic telomers by heating at 150-250 °C unsaturated fluorinated compounds with an R_FX telogen, where R_F and X are a perfluoroalkyl group and a halogen (Br or I), respectively. The degree of telomerization of the halogen-containing low-molecular-weight linear telomers ranged from 3 to 7. Rondestvedt²⁴ described the preparation of perfluoroalkyl iodide telomers with a general formula R_F[C(R¹)₂CR¹R²]₇I where R¹ is H or F, R² is H, F and R_F represents a perfluoroalkyl group containing 2-22 carbon atoms. A Japanese patent²⁵ claimed the synthesis of fluoroalkyl iodide telomers

$C_nF_{2n+1}(CR^1R^2CRR^1)_mI$ where $R=H$, alkyl, $R^1=H$, halogen, $m=2-6$, $n=3-20$, but the produced telomers were not characterized.

The aim of this work is to synthesize and to characterize 3,3,3 – trifluoroprop-1-ene telomers (mostly mono- and diadducts) with perfluoroalkyl iodides R_FI ($R_F=n-C_6F_{13}$ or $(CF_3)_2CF$) and their further modification to obtain new highly fluorinated monomers. The structure of the synthesized products, their main properties and telomerization mechanism were also studied.

II. RESULTS AND DISCUSSION

II-1) Telomerization of 3,3,3-trifluoroprop-1-ene (TFP)

Any radical telomerization requires radicals; in this study, the TFP telomerization involves various initiating systems (thermal, photochemical (UV), radical, metal complexes) and a perfluoroalkyl iodide R_FI (preferably $n-C_6F_{13}I$ and $i-C_3F_7I$) as the telogen (or chain-transfer agent) as shown in Scheme 1.

Scheme 1. Radical telomerization of 3,3,3-trifluoroprop-1-ene (TFP) with perfluoroalkyl iodide

Furthermore, the photochemical reaction and reactions of metal- complexes were carried out in batch conditions in Carius tubes. Thermal and peroxide initiations were carried out under pressure, in autoclave; at temperature ranging from 60 to 180 °C depending on the initiators used (the reaction temperature was chosen as a temperature of which their half-life was close to 1 h). The initial telogen $[T]_0$ /monomer $[M]_0$ molar

ratio (R_0) varied from 0.25 to 1.50 and the reaction time ranged from 4 to 22 h. The main results are displayed in Table 2.

(Insert Table 2)

The product mixture was analyzed by GC and, after distillation, the fractions were characterized by ^1H , ^{19}F and ^{13}C NMR. The yield of mono- ($n=1$) and diadducts ($n=2$), of normal and reverse-addition product ratios as a function of reaction conditions are also shown in Table 2.

The most suitable initiators were: di-*tert*-butyl peroxide (DTBP) and 2,5-bis(*tert*-butylperoxy)-2,5-dimethylhexane (Trigonox101). The yields (Y) of the diadducts were higher than 65 % for $R_0=0.5$ and of monoadducts higher than 50 % for $R_0=1.4$.

The structure of the telomers and the mechanism of radical telomerization of TFP were proved by NMR analysis. The NMR characteristics are detailed in the Experimental part. ^{19}F NMR spectrum of $n\text{-C}_6\text{F}_{13}[\text{CH}_2\text{-CH}(\text{CF}_3)]_n\text{I}$ as an example of monoadduct is shown in Fig.1.

(Insert Figure 1)

There was no signal at -59 ppm, assigned to CF_2I end-group of the reacted telogen. Two peaks were observed in the range from -67 to -72 ppm. The first one, at -67.2 ppm (b, CF_3 of TFP), is related to the reverse addition (only 4.5 mol %). The major product (a, CF_3 of TFP at -70.2 ppm) has a structure with a normal addition (95.5 mol %). All other signals are assigned to the $n\text{-C}_6\text{F}_{13}$ group of the telogen. The expected signal at -81.5 ppm (t, $J=9.5$ Hz) is assigned to the α CF_3 of $n\text{-C}_6\text{F}_{13}$. The other signals are: λ (-113.7, m, CF_2CH_2), ϵ (-121.6 ppm, $\text{CF}_2\text{CF}_2\text{CH}_2$), δ (-122.8, m, $\text{C}_2\text{F}_5\text{CF}_2\text{CF}_2$), γ (-123.6, m, $\text{C}_2\text{F}_5\text{CF}_2$) and β (-126.6, m, CF_3CF_2).

The ^1H NMR spectra of both monoadducts show the presence of the characteristic quintet of the AB-X system: 4.8 ppm, C^*H -, $^3J_{\text{HF}} = ^3J_{\text{HHA}} \sim 15$ Hz; $^3J_{\text{HHB}} = 7$ Hz and a multiplet at 3.25-2.65 ppm, centered at 2.9 ppm (m, H_A , H_B in AB system $\text{R}_\text{F}\text{CH}_2$).

In addition, the ^{13}C NMR spectrum exhibits a quartet at 133.35, 127.88, 122.41, 116.93 ppm, assigned to CF_3 ($^1J_{\text{CF}} = 275.4$ Hz) and a triplet at 36.59, 36.17, 35.75 ppm for CH_2 of TFP ($^3J_{\text{CF}} = 20.8$ Hz). The quartet with negative intensity at 7.07, 6.42, 5.74, 5.06 ppm is assigned to asymmetric carbon C^*H ($^2J_{\text{CF}} = 33.5$ Hz) while that at -15.3 ppm is related to a reverse addition product (~ 3.0 mol %) of the CH_2 -I terminal group. Interestingly, the reverse monoadduct was not produced from *i*- $\text{C}_3\text{F}_7\text{I}$ giving a more electrophilic and bulky perfluoroisopropyl radical, which hence reacted selectively at the CH_2 of TFP (more “nucleophilic” and less hindered than the $=\text{CH}$ site).

The NMR spectra of TFP diadducts of the *n*- $\text{C}_6\text{F}_{13}\text{I}$ telogen and those of $(\text{CF}_3)_2\text{CFI}$ are described in Experimental part (Runs 2, 7 and 8, Table 3) and DEPT ^{13}C NMR spectrum of $(\text{CF}_3)_2\text{CFCH}_2\text{-CH}(\text{CF}_3)\text{I}$ monoadduct is illustrated in Fig. 2.

(Insert Figure 2)

Mechanism of TFP telomerization

Two alternatives of the the mechanism can be proposed: the first one is the classical mechanism of telomerization in which the $\text{R}_\text{F} \text{CH}_2\text{-CH}(\text{CF}_3)^\bullet$ radical produced may undergo either telogen transfer or initiate the propagation of TFP. In the latter case, the reverse addition product can be formed in the propagation step (Scheme 2).

(Insert Scheme 2)

However, a stepwise mechanism may operate in which $\text{R}_\text{F} \text{CH}_2\text{-CH}(\text{CF}_3)\text{I}$ formed by $\text{R}_\text{F}\text{I}$ transfer acts as a telogen in further telomerization of TFP as shown in Scheme 2.

II-2) Synthesis of iodo-acetate compounds of TFP telomers, $R_F[CH_2-CH(CF_3)]_nI$, $n=1,2$.

This type of reactions was studied earlier²⁶ and more recently described²⁷.

Various peroxides such as dibenzoyl peroxide, *tert*-pentyl peroxyphthalate, DTBP, AIBN, etc. can be used. Because of the great exothermicity of the reaction, the initiator used was of high importance; its activity is associated with its low decomposition temperature. It was previously observed that when the starting temperature was higher than 90 °C (e.g. ,when initiated with dibenzoyl peroxide) the reaction temperature rose to 160 -180 °C and at such high temperature the produced ω -perfluoroiodoacetate undergoes a thermal rearrangement to $R_FCH_2CH(OAc)CH_2I$ ^{26, 28}.

To avoid such an undesired transformation, we chose AIBN as the initiator added²⁷. In this case, no exotherm was observed and the GC yield increased up to 80-82 wt% or 75 wt % after distillation.

Scheme 3.Radical addition of TFP telomers onto allyl acetate

The main results are presented in Table 3.

(Insert Table 3)

The structure of different iodo-acetates was studied by ¹H and ¹⁹F NMR spectroscopy (Runs 3, 4, 9, 10 in Experimental part). The signals at 4.2 ppm are assigned to protons of CH_2OAc groups of normal structure. However, the rearranged iodo-acetate (the signal of $CHOAc$ at 5.10 ppm) was not observed. The multiplet at 4.3-4.5 ppm is related to the CHI group, the multiplet of CH_2CHI at 2.1-2.2 ppm and a singlet at 2.02

ppm is attributed to CH_3 of the acetate. The other signals at 2.25-2.60 ppm (m, CFCH_2) and at 2.8-3.1 ppm (m, $^*\text{CH}(\text{CF}_3)$) are assigned to TFP protons.

For the diadduct, ^1H NMR spectra are more complex due to a new multiplet in the range of 1.6-1.9 ppm ($^*\text{C}-\text{CH}_2-\text{C}^*$).

The ^{19}F NMR spectra are similar to those of the starting telomers.

II-3) Synthesis of fluoroallylic monomers $\text{CH}_2=\text{CH}-\text{CH}_2(\text{C}_3\text{H}_3\text{F}_3)_n\text{R}_\text{F}$

As described previously²⁷⁻²⁹, fluorinated allyl monomers C_n can be obtained by deiododeacetatization reaction from B_n (Scheme 4)

Scheme 4. Synthesis of fluorinated allylic monomers based on TFP

The iodo-acetate B_n was added to a two-fold excess of activated Zn in MeOH. The reaction was rather exothermic and was monitored by GC. The conversion of B_n was complete. The overall yield of the reaction product C_n was close to 75 % after distillation.

Both allylic monomers with $n\text{-C}_6\text{F}_{13}$ or $(\text{CF}_3)_2\text{CF}$ groups were characterized by ^1H and ^{19}F NMR spectroscopies. The ^1H NMR spectrum of $(\text{CF}_3)_2\text{CFCH}_2-\text{CH}(\text{CF}_3)-\text{CH}_2\text{CH}=\text{CH}_2$ exhibits two multiplets in the 5.0-5.4 ppm and at 5.6-5.9 ppm regions, assigned to the protons of the double bond $\text{CH}=\text{CH}_2$ and $\text{CH}_2=\text{CH}$ (Fig. 3). The multiplet at 2.6-3.0 ppm is related to the proton of asymmetric carbon, $^*\text{CH}(\text{CF}_3)$ and that at 2.2-2.6 ppm to both methylene protons of the $\text{CH}_2\text{CH}=\text{CH}_2$ and CFCH_2 structures.

(Insert Figure 3)

The ^{13}C NMR spectrum also confirms the structure of the allylic monomers. Hence, the signals at 132.2 ppm ($=\text{CH}$, 1C) and 119.4 ppm (s, $\text{CH}=\text{CH}_2$, 1C) are assigned to both carbon atoms of the double bond. Both quartets centered at 128 and 120 ppm are assigned to CF_3 - of TFP ($^1J_{\text{CF}}=279.7$ Hz) and $(\text{CF}_3)_2$ of telogen ($^1J_{\text{CF}}=284.7$ Hz, $^2J_{\text{CF}}=27.2$ Hz), respectively. The doublet ($^1J_{\text{CF}}=206.3$ Hz) of septuplet ($^2J_{\text{CF}}=32.0$ Hz) centered at 90 ppm is characteristic of the CF group adjacent to both CF_3 end-groups while the quartet ($^2J_{\text{CF}}=27.2$ Hz) centered at 37.1 ppm is assigned to $^*\text{CH}(\text{CF}_3)$ group. The other signals are characteristic of the allyl carbon atoms with the doublet of CFCH_2 , ($^2J_{\text{CF}}=19.1$ Hz) at 25.5 ppm. Of course, the ^{13}C NMR spectra of diadducts are more complex (see Experimental part). The ^{19}F NMR spectra are similar to those of corresponding telomers and some of them were already discussed. The details of these spectra are presented in Experimental.

III.CONCLUSION

This work described the synthesis of four new highly fluorinated telomers based on 3,3,3-trifluoroprop-1-ene ($n=1$ and 2) and their functionalization to obtain allylic monomers containing TFP unit(s), by a three step-reaction for further applications. The first step involved a simple bulk addition of perfluoroalkyl iodide $\text{R}_\text{F}\text{I}$ ($\text{R}_\text{F}=n\text{-C}_6\text{F}_{13}$ or $i\text{-C}_3\text{F}_7$) onto TFP and showed that DTBP at 150 °C was a suitable initiator to get 50-60 % yield for $n=1$ or 2 depending on the R_0 ratio. For $n\text{-C}_6\text{F}_{13}\text{I}$ as the telogen, both normal and reverse additions took place, but no reverse addition product was obtained with $i\text{-C}_3\text{F}_7\text{I}$. The second step involved radical addition of $\text{R}_\text{F}(\text{C}_3\text{H}_3\text{F}_3)_n\text{I}$ onto allyl acetate using AIBN initiator added portionwise. The thermal rearrangement was not observed,

and the yield was satisfactory (50-80 %). In the third step, the deiiododeacetatization took place to produce allylic fluorine-containing monomer in 50-80% yield. All the compounds synthesized were characterized by GC and ^1H , ^{19}F , and ^{13}C NMR spectroscopies. The obtained products could be suitable intermediates in preparation of new fluorinated products utilized as coating materials, surfactants, block copolymers, hybrid fluorosilicones.

IV.EXPERIMENTAL

IV-1) Reactants

3,3,3-trifluoroprop-1-ene (TFP) and heptafluoro-2-iodopropane ($i\text{-C}_3\text{F}_7\text{I}$) were kindly supplied by the Great Lakes Chemical Corporation (now Chemtura, West Lafayette, IN., USA), tridecafluoro-6-iodohexane ($n\text{-C}_6\text{F}_{13}\text{I}$) by Elf Atochem (Pierre Benite, France), 2,5-bis(*tert*-butylperoxy)-2,5-dimethylhexane (Trigonox101) by Akzo Nobel, acetonitrile by SDS, AIBN and di-*tert*-butyl peroxide (DTBP) by Aldrich, and were used as received.

IV-2) Apparatus

After reaction and evaporation of the solvent, the product mixture was analyzed by gas chromatography (GC) using a Delsi apparatus (model 330) equipped with a SE 30 column, 2 m x 1/8 in. (i.d.). The nitrogen pressure at the inlet of the column was maintained at 1 bar and the detector and injector temperatures were 240 °C and 235 °C, respectively. The temperature programmer started from 50 °C and reached 200 °C at a heating rate of 10 °C/min. The GC apparatus was connected to a Hewlett Packard integrator (model 3390).

The structures of the telomers were determined by NMR spectroscopy at room temperature. The ^1H , ^{19}F , and ^{13}C NMR spectra were recorded on a Bruker AC-250 or Bruker 400 MHz instruments using deuterated chloroform or acetone and tetramethyl silane or CFCl_3 as the solvent and internal references, respectively. The experimental conditions for recording ^1H (or ^{19}F) NMR spectra were the following : flip angle 90° (30°) ; acquisition time 4.5 s (0.7 s) ; pulse delay 2 s (5 s) ; 36 (64) scans and pulse width 5 μs for ^{19}F NMR. Abbreviations used: s- singlet, d- double, t- triplet, q- quartet, qn- quintet, sex- sextet; sept- septuplet; m- multiplet
er - erythro ; tr -threo

IV-3) Reactions

IV-3a) Telomerization of TFP with $R_{\text{F}}\text{I}$ to obtain $R_{\text{F}}(\text{TFP})_n\text{I}$

In a 160 or 500 cm^3 Hastelloy autoclave equipped with a manometer, a magnetic stirrer, and safety valve, $R_{\text{F}}\text{I}$ and the initiator (in amounts depending on initial molar ratios R_0 and C_0) were introduced and purged with Ar for 15 min. The reactor was closed and checked for the leak at 30 bar of N_2 . The reactor was placed in acetone/liquid nitrogen to cool the contents. Then, 5-7 vacuum-Ar cycles were applied to remove oxygen from the liquid. The required amount of TFP, depending on the R_0 was condensed in the autoclave. The autoclave was heated up to 150°C and the telomerization was carried out at $150 \pm 5^\circ\text{C}$ for 4 h. According to the TFP amount, the pressure was increased and pressure and temperature were recorded during the reaction. A sharp decrease in the pressure at almost constant temperature (150°C) for the first hour and then a small pressure change were observed. After the reaction stopped, the autoclave was cooled and then placed in an ice bath. The unreacted monomer was expelled by purging and the conversion of telomerization was determined by double weighing ($\sim 90\text{-}95\%$). The

crude product was analyzed by GC and then washed with a saturated solution of $\text{Na}_2\text{S}_2\text{O}_5$ in aqueous NaOH to remove the iodine produced. The reaction mixture was distilled to separate the adducts. The retention time (RT) and boiling point (b.p.) of the products are listed in Table 3.

Characteristics of the products

IV-3b) Synthesis of R_F(C₃H₃F₃)_n-CH₂CH(I)CH₂OCOCH₃

In a 250 ml three-necked round-bottom flask equipped with a double condenser and a thermometer were introduced a certain amount of monoadduct or diadduct produced in the previous reaction and a 1.2-fold excess of allyl acetate. Then, the mixture was heated up to 82 °C and stirred. When the temperature reached 80 °C, AIBN (C₀= 0.015 to 0.050) was introduced step-wise for 10 h- reaction time. No exothermicity was

observed. After 10 h, the reaction was stopped; the crude product was cooled to room temperature, filtered and analyzed by GC. The reaction mixture was distilled to purify the iodo-acetate. The obtained characteristics are shown in Table 3.

Characteristics of the products

Run 3, Table 3: $n\text{-C}_6\text{F}_{13}(\text{C}_3\text{H}_3\text{F}_3)\text{-CH}_2\text{CH(I)CH}_2\text{OCOCH}_3$

6,6,7,7,8,8,9,9,10,10,11,11,11-tridecafluoro-2-iodo-4-(trifluoromethyl)undecyl acetate

^{19}F NMR (CDCl_3) δ , ppm: -81.9 and from -111 to -127 (the same chemical shifts as for Run 1) -71.39 and -72.59 are assigned to CF_3 of TFP in both diastereoisomers.

^1H NMR (CDCl_3) δ , ppm: 2.05 (s, CH_3 , 3H), 2.4-2.6 (m, $\text{C}^*\text{H}(\text{CF}_3)$, 1H), 2.8-3.0 (m, $\text{C}_6\text{F}_{13}\text{CH}_2$, 2H), 4.1-4.3 (m, $\text{CH}_2\text{OCOCH}_3$, 2H), 4.4-4.5 (m, $\text{C}^*\text{H(I)}$, 1H).

Run 9, Table 3: $(\text{CF}_3)_2\text{CF}(\text{C}_3\text{H}_3\text{F}_3)\text{CH}_2\text{CH(I)CH}_2\text{OCOCH}_3$

6,7,7,7-tetrafluoroheptyl-2-iodo-4,6-bis(trifluoromethyl) acetate

^{19}F NMR (CDCl_3) δ , ppm: -71.2 and -72.3 (CF_3 of TFP, (normal and reverse adducts), 3F), -77.3 and -77.6 (m, $(\text{CF}_3)_2\text{C(F)}$, $^3J_{\text{FF}}=69.5$ Hz, 6F), -185.8, -187.1 (m, C(F) , 1F).

^1H NMR (CDCl_3) δ , ppm : 2.02 (s, CH_3 , 3H), 2.1-2.2 (m, $\text{CH}_2\text{CH(I)}$, 2H), 2.25-2.60 (m, C(F)CH_2 , 2H), 2.8-3.1 (m, $^*\text{CH}(\text{CF}_3)$, 1H), 4.1-4.25 (m, CH_2OCO , 2H), 4.3-4.5 (m, CH(I) , 1H).

Run 4, Table 3: $n\text{-C}_6\text{F}_{13}(\text{C}_3\text{H}_3\text{F}_3)_2\text{-CH}_2\text{CH(I)CH}_2\text{OCOCH}_3$

8,8,9,9,10,10,11,11,12,12,13,13,13-tridecafluoro-2-iodo-4,6-bis(trifluoromethyl) tridecanyl acetate

^{19}F NMR (CDCl_3) δ , ppm: - 70 to -73 (complex system, $2x\text{CF}_3$ of TFP, 6F), -81.6 (s, CF_3 of $n\text{-C}_6\text{F}_{13}$, 3F), -111.8 to -127 (the same assignments as those in Run 1, ^{19}F NMR).

^1H NMR (CDCl_3) δ , ppm: 2.05 (s, CH_3 from OCOCH_3 , 3H), 2.3 ($^*\text{C-CH}_2\text{-}^*\text{C}$, 2H), 2.24 ($\text{CH}_2\text{CH(I)}$, 2H), 2.5 ($^*\text{CH}(\text{CF}_3)$ overlapping with 2.58 ppm signal, 1H), 2.58

(m, R_F-CH₂, 2H) , 2.8 (m, *CH(CF₃), 1H), 4.2 (m, C*H(I), 1H), 4.4 (m, ester CH₂OCOCH₃, 2H).

Run 10, Table 3: (CF₃)₂CF(C₃H₃F₃)₂CH₂CH(I)CH₂OCOCH₃

8,9,9,9-tetrafluoro-2-iodo-4,6,8-tris(trifluoromethyl)nonyl acetate

¹⁹F NMR (CDCl₃) δ, ppm : no signal at -67 (no reverse product) ; -70.5 to -72.77 (m, 2xCF₃ of TFP, 6F), -77.2 to 78.75 (m , (CF₃)₂, 6F) ; -186.4, -187.14, -187.73 (t, C(F), 1F).

¹H NMR (CDCl₃ , ppm) δ: 1.6-1.9 (m, *C-CH₂-*C, 2H) ; 2.02-2.25, (CH₃ in CH₃OCO, 3H), 2.25-2.4 (CH₂-CHI, 2H); 2.3-2.5 (R_F-CH₂, 2H) ; 2.6-3.0 (*CH(CF₃), 1H) , 4.2 (m, 1H of CH(I) + 1H of *CH(CF₃)) , 4.4 (m, ester CH₂OCOCH₃, 2H).

IV-3c) Synthesis of R_F(C₃H₃F₃)_n-CH₂CH=CH₂

Zn dust was activated with 1.2 g of a mixture of acetic acid/acetic anhydride (1/1), 40 ml of CH₃OH was added and they were introduced into 250 ml two-neck round- bottom flask with a reverse condenser and magnetic stirrer. The temperature was increased to 65 °C while stirring. The iodo-acetate prepared in Run 3, Table 3 (60.05 g, 0.094 mol) in 30 ml MeOH was added dropwise under reflux to a Zn slurry within 3 h with vigorous stirring and then the reaction mixture was stirred for 2 h. A colourless product was obtained. The Zn complex was filtered off, the filtrate was diluted with CH₂Cl₂ (1/1 vol.) and washed with 10 % HCl aqueous solution (100 ml) and washed again with distilled water. The organic phase was added dropwise to anhydrous MgSO₄ under stirring to eliminate traces of water, filtered and twice distilled (Table 3).

Characteristics of the products

Run 5, Table 3: n-C₆F₁₃(C₃H₃F₃)-CH₂CH=CH₂

6,6,7,7,8,8,9,9,10,10,11,11,11-tridecafluoro-4-(trifluoromethyl)undec-1-ene

¹⁹F NMR (CDCl₃) δ, ppm: The same chemical shifts as those of *n*-C₆F₁₃(C₃H₃F₃)-CH₂CH(I)CH₂OCOCH₃ except for the signal centred at -113 ppm which is simpler and gives only one peak at -72.0 (one diastereoisomer).

¹H NMR (CDCl₃)δ, ppm: 2.2-2.6 (m, *n*-C₆F₁₃CH and CH₂-CH, 4H), 2.6-2.8 (m, *CH(CF₃), 1H), 5.1-5.4 (m, CH₂=, 2H), 5.6-5.9 (m, CH=, 1H).

¹³C NMR (CDCl₃) δ, ppm: 132.18 (132.08) (d (2 diastereoisomers), CH=, 1C), 131.03; 128.26, 125.48, 122.71 (q, CF₃ of TFP, ¹J_{CF}=279.0 Hz, 1C), 120.4 -104.9 (complex system, *n*-C₆F₁₃, 6C), 118.8-118.7 (d, CH₂=, 1C), 36.68-35.86 (q, *CH(CF₃), ²J_{CF}=27.2 Hz, 1C), 32.68 (s, CH₂, 1C), 28.18-27.75 (t, CH₂R_F, ²J_{CF}=21.13 Hz, 1C).

Run 11, Table 3: (CF₃)₂CF(C₃H₃F₃)CH₂CH=CH₂

6,7,7,7-tetrafluoro-4,6-bis(trifluoromethyl)hept-1-ene

¹⁹F NMR (CDCl₃) δ, ppm: -72.2 (CF₃ of TFP, 3F), -78.8 and -78.4 (dt, (CF₃)₂, 6F), -187.1 (m, C(F), 1F).

¹H NMR (CDCl₃)δ, ppm: 2.2-2.6 (m, CH₂CH=CH₂ + C(F)CH₂, 4H), 2.6-3.0 (m, *CH(CF₃), 1H), 5.05-5.4 (m, CH=CH₂, 2H), 5.6-5.9 (m, CH₂=CH, 1H).

¹³C NMR (CDCl₃) δ, ppm: 132.2 (=CH, 1C), 131.1; 128.3; 125.5; 122.8 (q, CF₃ of TFP, ¹J_{CF}=279.7 Hz, 1C), 125.0; 122.1; 119.0; 116.5 (q of d (CF₃)₂, ¹J_{CF}=284.7 Hz, ²J_{CF}=27.2 Hz, 6C), 119.4 (s, CH=CH₂, 1C), 90 (d of sept, C(F), ¹J_{CF}=206.3 Hz, ²J_{CF}=32.0 Hz, 1C), 37.1 (q, *CH(CF₃), ²J_{CF}=27.2 Hz, 1C), 33.27 (q, CH₂=CHCH₂, ³J_{CF}=2.0 Hz, 1C), 25.5 (d, C(F)CH₂, ²J_{CF}=19.1 Hz, 1C).

Run 6, Table 3: *n*-C₆F₁₃(C₃H₃F₃)₂-CH₂CH=CH₂

8,8,9,9,10,10,11,11,12,12,13,13,13-tridecafluoro-4,6-bis(trifluoromethyl)tridec-1-ene

¹⁹F NMR (CDCl₃) δ, ppm: -71.9 (d, CF₃ adjacent to allyl, 3F), -72.6 (d, CF₃ of TFP to the C₆F₁₃ side, 3F), -82.0 (t, α CF₃ of *n*-C₆F₁₃, 3F), the group of signals from -112 to -127 ppm belongs to C₅F₁₀ as in Run 1.

¹H NMR (CDCl₃) δ, ppm: 1.6-1.8 and 50 % from 1.8-2.2 (qn, *C-CH₂-C*, 2H), 1.8-2.2 (m, CH₂CH=CH₂, 2H), 2.2-2.6 (m, overlap of 2H from CH₂ of R_FCH₂ and 1H from *CH (CF₃)), 2.8 (m, *CH (CF₃), 1H), 5.10-5.18 (m, CH₂=, 2H), 5.58 –5.84 (m, CH=, 1H).

¹³C NMR (CDCl₃) δ, ppm: 133.03 (132.81) (d, (diastereoisomers), CH=, 1C), 131.73 (131.61); 128.96 (128.83); 126.18 (126.06); 123.41 (123.28) (q of d (diastereoisomers) CF₃ of TFP on the side of R_F, ¹J_{CF}=279.2 Hz, 1C), 131.10 (130.94); 128.32 (128.16); 125.55 (125.39); 122.78 (122.62) (q of t (diastereoisomers), CF₃ of TFP on the side of allyl, ¹J_{CF}=279.01 Hz, ²J_{CF}=31.5 Hz, 1C), 118.40 (118.28) (d, CH₂=, 1C), 122-105.9 (complex system of C₆F₁₃, 6C), 40.46 (40.39); 40.20 (40.14); 39.95 (39.88); 39.69 (39.63) (q of d (diastereoisomers) *CH(CF₃) from the side of R_F, ²J_{CF}=25.8 Hz, 1C), 35.06; 34.80; 34.52; 34.25; 33.98 (q, *CH(CF₃) from the side of allyl, ²J_{CF}=27.25 Hz, 1C), 32.60 (32.57); 32.22 (32.20) (CH₂ adjacent to vinyl, 1C), 30.51; 30.09; 29.88 (t, R_FCH₂, ²J_{CF}=21.5 Hz, 1C), 27.52 (s, CH₂ from *C-CH₂-*C, 1C).

Run 12, Table3; (CF₃)₂CF(C₃H₃F₃)₂CH₂CH=CH₂

8,9,9,9- tetrafluoro-4,6,8-tris(trifluoromethyl)non-1-ene

¹⁹F NMR (CDCl₃) δ, ppm : -71.7; -72.2; -72.5 (t, 2x CF₃ in TFP, 6F), -77.7 to -78.9 (dt, (CF₃)₂, 6F), -186.9; -187.4 (m, C(F), 1F).

¹H NMR (CDCl₃) δ, ppm : 1.55-2.2(m, CH₂ from *C-CH₂-C*, 2H), 2.0-2.2 (m, allyl CH₂, 2H), 2.3-2.5 (m, 2H of R_F-CH₂+ 25 % of diastereoisomer *CH(CF₃) from the

side of R_F), 2.9 (m, 1H of *CH(CF₃) from the side of the allyl), 5.20 (m, CH₂=, 2H), 5.7 (m, CH=CH₂, 1H).

¹³C NMR (CDCl₃) δ, ppm : 133.21 (132.89) (d, CH₂=CH-, 1C) , 131.76 (131.61); 128.98 (128.83); 126.20 (126.05); 123.43 (123.28) (q, CF₃ of TFP on the side of R_F, ¹J_{CF}=279.7 Hz, 1C), 131.18 (131.00); 128.40 (128.22); 125.62 (125.45); 122.84 (122.67) (q, CF₃ of TFP adjacent to allyl, ¹J_{CF}=279.7 Hz, 1C), 125.10 (125.06); 124.82 (124.79); 122.26 (122.23); 121.98 (121.95); 116.59 (116.55); 116.30 (116.26) (two qq, (CF₃)₂ , ¹J_{CF}=285.7 Hz, ²J_{CF}=28.17 Hz , 2C), 188.29 (118.24) (d, CH =CH₂, 1C) , 92.74 –88.77 (d of sept, -C(F)-, ¹J_{CF}=206.25 Hz, ²J_{CF}=32.2 Hz, 1C), 40.37-39.38 (qn, *CH(CF₃), ²J_{CF}=25.15 Hz, 1C) , 35.85 – 34.68 (qn of d, *CH(CF₃) adjacent to allyl, ²J_{CF}=27.16 Hz, 1C), 32.78 –32.75 (d, CH₂ adjacent to vinyl, 1C) , 32.10; 32.08; 31.91 (t, CH₂ between 2*C, 1C), 28.94, 27.70 (two d CH₂-R_F, ²J_{CF}=19.12 Hz, 1C).

Graphical Abstract

TELOMERIZATION OF 3, 3, 3-TRIFLUOROPROP-1-ENE AND FUNCTIONALIZATION OF ITS TELOMERS

Telomerization of 3,3,3-trifluoroprop-1-ene (TFP) with linear (n -C₆F₁₃I) or branched [(CF₃)₂CFI] perfluoroalkyl iodides led to **A,n** telomers which were chemically changed into their allyl derivatives, as follows:
