L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

CARLEMAN ESTIMATE FOR ELLIPTIC OPERATORS WITH COEFFICIENTS WITH JUMPS AT AN INTERFACE IN ARBITRARY DIMENSION AND APPLICATION TO THE NULL CONTROLLABILITY OF LINEAR PARABOLIC EQUATIONS

JÉRÔME LE ROUSSEAU AND LUC ROBBIANO

A . In a bounded domain of \mathbf{R}^{n+1} , $n \geq 2$, we consider a second-order elliptic operator, $A = -\partial_{x_0}^2 - \nabla_x \cdot (c(x)\nabla_x)$, where the (scalar) coefficient $c(x)$ is piecewise smooth yet discontinuous across a smooth interface S . We prove a local Carleman estimate for A in the neighborhood of any point of the interface. The “observation” region can be chosen independently of the sign of the jump of the coefficient c at the considered point. The derivation of this estimate relies on the separation of the problem into three microlocal regions and the Calderón projector technique. Following the method of Lebeau and Robbiano [LR95] we then prove the null controllability for the linear parabolic initial problem with Dirichlet boundary conditions associated to the operator $\partial_t - \nabla_x \cdot (c(x)\nabla_x)$.

Keywords: Elliptic equation; Non-smooth coefficient; Transmission problem; Carleman estimate; Microlocal analysis; Calderón projectors; Parabolic equation; Control.

1. I

The question of the null controllability of linear parabolic partial differential equations with smooth coefficients was solved in the 1990’s [LR95, FI96]. In the case of discontinuous coefficients in the principal part of the parabolic operator, the controllability issue and its dual counterpart, observability, are not fully solved yet. A result of controllability for a semi-linear heat equation with a coefficient that is discontinuous at an interface was proven in [DOP02] by means of a global Carleman observability estimate. Roughly speaking, as in the case of hyperbolic systems (see e.g. [Lio88, page 356]), the authors of [DOP02] proved their controllability result in the case where the control is supported in the region where the diffusion coefficient is the ‘lowest’. In both cases, however, the approximate controllability, and its dual counterpart, uniqueness, are true without any restriction on the monotonicity of the coefficients. It is then natural to question whether or not an observability estimate holds in the case of non-smooth coefficients and arbitrary observation location.

Recently, in the one-dimensional case, the controllability result for parabolic equations was proven for general piecewise \mathcal{C}^1 coefficients in [BDL07a], and for coefficients with bounded variations (BV) in [Le 07], which improved the result of [FCZ02]. The proof relies on global *Carleman estimates*, which moreover allow to treat semilinear equations. Simultaneously, a controllability result for parabolic equations with

general bounded coefficients in one dimension was proven in [AE07]. The method used there to achieve null controllability is that of [LR95], which limits the field of applications to linear equations.

In the n -dimensional case, $n \geq 2$, a positive answer to the controllability question was given for a class of discontinuous coefficients, with separated variables, that are smooth w.r.t. to all but one variables, which includes the case of stratified media [BDL07b]. The proof relies both on the Carleman estimates of [BDL07a, Le 07] in the one-dimensional case and the method of [LR95].

In the present article, in the case $n \geq 2$, we achieve null controllability for a *linear* parabolic equation in the case of a coefficient that exhibits jumps of *arbitrary signs* at an interface. Let Ω be a smooth bounded connected domain in \mathbf{R}^n . We consider the operator $L := \nabla_x \cdot (c(x)\nabla_x)$, with possibly additional lower-order terms, and where $c(x)$ satisfies

$$0 < c_{\min} \leq c(x) \leq c_{\max} < \infty,$$

to ensure uniform ellipticity for L . The coefficient c is assumed smooth apart from across an interface S , where it may jump. The interface S is the boundary of a smooth open subset $\Omega_1 \Subset \Omega$, i.e., Ω_1 lies on one side of S . Let $T > 0$ and set $Q_T = (0, T) \times \Omega$. We set $\Omega_2 = \Omega \setminus \overline{\Omega_1}$. We prove the following null controllability result.

Theorem 1.1. *For an arbitrary time $T > 0$ and an arbitrary non-empty open subset $\omega \subset \Omega$ and an initial condition $q_0 \in L^2(\Omega)$, there exists $u \in L^2((0, T) \times \Omega)$ such that the solution q of*

$$(1.1) \quad \begin{cases} \partial_t q - Lq = 1_\omega u & \text{in } Q_T, \\ q(t, x) = 0 & \text{on } (0, T) \times \partial\Omega, \\ q(0, x) = q_0(x) & \text{in } \Omega, \end{cases}$$

satisfies $q(T) = 0$ a.e. in Ω .

We follow the method of [LR95], thus proving local Carleman estimates for an elliptic operator associated to the considered parabolic problem: we introduce the elliptic operator $A := -\partial_{x_0}^2 - L$. The variable x_0 is an additional variables in $(0, X_0)$, for some $X_0 > 0$. We provide such a local Carleman estimate for the operator A in a small neighborhood V of a point (y_0, y) of $(0, X_0) \times S$ with an “observation” on one side of S , independently of the sign of the jump of c at (y_0, y) . We hence treat all possible cases including the case that can be treated more classically as mentioned above, for which the “observation” is supported in the region where the diffusion coefficient is the ‘lowest’ [DOP02].

We denote by (\cdot, \cdot) the inner product on $L^2((0, X_0) \times \Omega)$ and by $\|\cdot\|_0$ the induced norm. In the present article, we shall make use of techniques from the semi-classical analysis of pseudodifferential operators (ψ DOs) [Mar02]. With h as the small parameter, we set $D = \frac{h}{i}\partial$. Accordingly, we shall use the semi-classical Sobolev norm $\|f\|_k^2 := \sum_{|\alpha| \leq k} \|D_{x_0, x}^\alpha f\|_0^2$, $k \in \mathbf{N}$.

The Carleman estimate we aim to prove is of the form

$$h\|e^{\varphi/h}w\|_0^2 + h^3\|e^{\varphi/h}\nabla_{x_0, x}w\|_0^2 \leq Ch^4\|e^{\varphi/h}f\|_0^2, \quad Aw = f \text{ in } (0, X_0) \times (\Omega \setminus S), \quad h > 0,$$

for h sufficiently small and $\text{supp}(w) \subset V$, when w is smooth on both sides of the interface.

The sign of $\partial_n \varphi$ at the interface locates the side of the interface on which the “observation” takes place (see Section 2 for the application of the local Carleman estimate). To achieve such a Carleman estimate we follow the method of [LR97], in the spirit of the work of [Bel03]. In particular, we separate the interface problem into three microlocal regions for which partial Carleman estimates are obtained. In some of these regions we make use of the Calderón-projector technique.

With this local Carleman estimate at the interface, we can then prove an interpolation inequality that first yields an estimation of the loss of orthogonality for the eigenfunctions $\phi_j(x)$, $j \in \mathbf{N}$, of the operator L , with Dirichlet boundary conditions, when these eigenfunctions are restricted to ω . We denote by μ_j , $j \in \mathbf{N}$, the associated eigenvalues, sorted in an increasing sequence.

Theorem 1.2. *For any $(a_j)_{j \in \mathbf{N}} \subset \mathbf{C}$ we have:*

$$(1.2) \quad \sum_{\mu_j \leq \mu} |a_j|^2 \leq C e^{C\sqrt{\mu}} \int_{\omega} \left| \sum_{\mu_j \leq \mu} a_j \phi_j(x) \right|^2 dx, \quad \mu > 0.$$

Following [LR95], this estimation then yields a construction of the control function $u(t, x)$ in (1.1), by sequentially acting on a finite yet increasing number of eigenspaces, and we hence obtain the result of Theorem 1.1. We refer the reader to [LR95] or [LZ98, Section 5, Proposition 2] for the details.

The reader will observe that the proof of the Carleman estimate can be adapted to other elliptic operators with non-smooth coefficients across an interface. Beyond the controllability result of interest in this article, such Carleman estimates have a wide range of applications, including unique continuation properties ([Hör63, Zui83, Hör85a]. See Remark 2.8 for further details.

The result of this article opens perspectives for future research towards the null controllability of semi-linear parabolic equations with non smooth coefficient in space dimension $n \geq 2$ and towards more complicated geometrical situations, for instance in the case of coefficients with singularities that do not lie on a *smooth* interface.

In this article, when the constant C is used, it refers to a constant that is independent of the semi-classical parameter h . Its value may however change from one line to another. If we want to keep track of the value of a constant we shall use another letter. We shall use of the notation $\langle \eta \rangle := (1 + |\eta|^2)^{\frac{1}{2}}$. Let us now introduce semi-classical ψ DOs. We denote by $S^m(\mathbf{R}^{n+1} \times \mathbf{R}^{n+1})$, S^m for short, the space of smooth functions $a(z, \zeta, h)$, defined for $h \in (0, h_0]$ for some $h_0 > 0$, that satisfy the following property: for all α, β multi-indices, there exists $C_{\alpha, \beta} \geq 0$, such that

$$\left| \partial_z^\alpha \partial_\zeta^\beta a(z, \zeta, h) \right| \leq C_{\alpha, \beta} \langle \zeta \rangle^{m-|\beta|}, \quad z \in \mathbf{R}^{n+1}, \zeta \in \mathbf{R}^{n+1}, h \in (0, h_0].$$

Then, for all sequences $a_{m-j} \in S^{m-j}$, $j \in \mathbf{N}$, there exists a symbol $a \in S^m$ such that $a \sim \sum_j h^j a_{m-j}$, in the sense that $a - \sum_{j < N} h^j a_{m-j} \in h^N S^{m-N}$ (see for instance [Mar02, Proposition 2.3.2] or [Hör85b, Proposition 18.1.3]), with a_m as principal symbol. We define Ψ^m as the space of ψ DOs $A = \text{Op}(a)$, for $a \in S^m$, formally defined by

$$A u(z) = (2\pi h)^{-(n+1)} \iint e^{i\langle z-t, \zeta \rangle/h} a(z, \zeta, h) u(t) dt d\zeta, \quad u \in \mathcal{S}'(\mathbf{R}^{n+1}).$$

We shall denote the principal symbol a_m by $\sigma(A)$. We shall use techniques of pseudodifferential calculus in this article, such as construction of parametrices, composition formula, formula for the symbol of the adjoint operator, etc. We refer the reader to [Tay81, Hör85b, Mar02]. In the main text the variable z will be (x_0, x) and $\zeta = (\xi_0, \xi)$.

We now introduce tangential symbols and associated operators. We set $z = (z', z_n)$, $z' = (z_0, \dots, z_{n-1})$ and $\zeta' = (\zeta_0, \dots, \zeta_{n-1})$ accordingly. We denote by $S_{\mathcal{T}}^m(\mathbf{R}^{n+1} \times \mathbf{R}^n)$, $S_{\mathcal{T}}^m$ for short, the space of smooth functions $b(z, \zeta', h)$, defined for $h \in (0, h_0]$ for some $h_0 > 0$, that satisfy the following property: for all α, β multi-indices, there exists $C_{\alpha\beta} \geq 0$, such that

$$\left| \partial_z^\alpha \partial_{\zeta'}^\beta b(z, \zeta', h) \right| \leq C_{\alpha\beta} \langle \zeta' \rangle^{m-|\beta|}, \quad z \in \mathbf{R}^{n+1}, \zeta' \in \mathbf{R}^n, h \in (0, h_0].$$

As above, for all sequences $b_{m-j} \in S_{\mathcal{T}}^{m-j}$, $j \in \mathbf{N}$, there exists a symbol $b \in S_{\mathcal{T}}^m$ such that $b \sim \sum_j h^j b_{m-j}$, in the sense that $b - \sum_{j < N} h^j b_{m-j} \in h^N S_{\mathcal{T}}^{m-N}$, with b_m as principal symbol. We define $\Psi_{\mathcal{T}}^m$ as the space of tangential ψ DOs $B = \text{op}(b)$ (observe the notation we adopt is different from above to avoid confusion), for $b \in S_{\mathcal{T}}^m$, formally defined by

$$Bu(z) = (2\pi h)^{-n} \iint e^{i\langle z' - t', \zeta' \rangle / h} b(z, \zeta', h) u(t', z_n) dt' d\zeta', \quad u \in \mathcal{S}'(\mathbf{R}^{n+1}).$$

We shall also denote the principal symbol b_m by $\sigma(B)$. In the case where the symbol is polynomial in ζ' and h , we shall denote the space of associated tangential *differential* operators by $\mathcal{D}_{\mathcal{T}}^m$. We shall denote by Λ^s the tangential ψ DO whose symbol is $\langle \zeta' \rangle^s$. The composition formula for tangential symbols, $b \in S_{\mathcal{T}}^m$, $b' \in S_{\mathcal{T}}^{m'}$, is given by

$$\begin{aligned} (1.3) \quad (b \#_{\mathcal{T}} b')(z, \zeta') &= (2\pi h)^{-n} \iint e^{-i\langle t', \tau' \rangle / h} b(z, \zeta' + \tau', h) b'(z' + t', z_n, \zeta', h) dt' d\tau' \\ &= \sum_{|\alpha| \leq M} \frac{(-ih)^{|\alpha|}}{\alpha!} \partial_{\zeta'}^\alpha b(z, \zeta', h) \partial_{z'}^\alpha b'(z, \zeta', h) \\ &\quad + \frac{(-ih)^{M+1}}{(2\pi h)^n} \sum_{|\alpha| = M+1} \int_0^1 \frac{(M+1)(1-s)^M}{\alpha!} \iint e^{-i\langle t', \tau' \rangle / h} \partial_{\zeta'}^\alpha b(z, \zeta' + \tau', h) \partial_{z'}^\alpha b'(z' + st', z_n, \zeta', h) dt' d\tau' ds, \end{aligned}$$

and yields a tangential symbol in $S_{\mathcal{T}}^{m+m'}$. In the main text the variable z will be (x_0, x', x_n) and $\zeta' = (\xi_0, \xi')$.

Following [LR95, LR97], we shall denote by $(\cdot, \cdot)_0$ the inner product for functions defined on $\{x_n = 0\}$, i.e., $(f, g)_0 := \iint f(x_0, x') \bar{g}(x_0, x') dx_0 dx'$. The induced norm is denoted by $|\cdot|_0$, i.e., $\|f\|_0^2 = (f, f)_0$. For $s \in \mathbf{R}$ we introduce $\|f\|_s := \|\Lambda^s f\|_0$.

The outline of the article is as follows. In section 2, we prove the announced local Carleman estimate at the interface for the elliptic operator A . In Section 3, we prove the interpolation inequality that implies (1.2). The controllability result then follows from [LR95].

2. L C

In the neighborhood of a point (y_0, y) of $(0, X_0) \times S$, we denote by x_n the variable that is normal to the interface S and by x' the remaining spacial variables, i.e., $x = (x', x_n)$. In particular $y = (y', 0)$. The interface

is now given by $S = \{x; x_n = 0\}$. The transmission conditions at the interface we shall consider are

$$(TC) \quad \forall x_0, x', \quad w|_{x_n=0^-} = w|_{x_n=0^+} + \theta, \quad c \partial_{x_n} w|_{x_n=0^-} = c \partial_{x_n} w|_{x_n=0^+} + \Theta,$$

i.e., the continuity of w at the interface as well as the continuity of the normal flux, modulo some error terms θ and Θ . It should be noted that for a function satisfying these transmission conditions we may not have Aw in L^2 in the neighborhood of (y_0, y) . It will however be in L^2 on both sides of the interface. Error terms like θ and Θ will be useful in Section 3 where the Carleman estimate proven in this section is used to achieve the null controllability result of Theorem 1.1.

In a sufficiently small neighborhood $V \subset \mathbf{R}^n$ of (y_0, y) , we place ourselves in normal geodesic coordinates (w.r.t. to the spacial variables x). For convenience, we shall take the neighborhood V of the form $(y_0 - \varepsilon, y_0 + \varepsilon) \times V_{y'} \times (-\varepsilon, \varepsilon)$, where $V_{y'}$ is a sufficiently small neighborhood of y' . In such coordinate system, the *principal part* of the differential operator A takes the following form [Hör85b, Appendix C.5] on both sides of the interface:

$$A_2 = -\partial_{x_0}^2 - c(x) \left(\partial_{x_n}^2 - r(x, \partial_{x'} / i) \right),$$

with $r(x, \xi')$ a x_n -family of second-order polynomials in ξ' that satisfy

$$(2.1) \quad r(x, \xi') \in \mathbf{R}, \quad \text{and} \quad C_1 |\xi'|^2 \leq r(x, \xi') \leq C_2 |\xi'|^2, \quad x \in V_{y'} \times (-\varepsilon, \varepsilon), \quad \xi' \in \mathbf{R}^{n-1},$$

for some $0 < C_1 \leq C_2 < \infty$. Note that the transmission conditions (TC) remain unchanged in this change of variables.

We set

$$\mathbf{R}_-^{n+1} = \{(x_0, x), x_n < 0\}, \quad \overline{\mathbf{R}}_-^{n+1} = \{(x_0, x), x_n \leq 0\}, \quad \mathbf{R}_+^{n+1} = \{(x_0, x), x_n > 0\}, \quad \overline{\mathbf{R}}_+^{n+1} = \{(x_0, x), x_n \geq 0\}, \\ V^g = V \cap \mathbf{R}_-^{n+1}, \quad V^d = V \cap \mathbf{R}_+^{n+1}.$$

For a compact set K of V we set $K^g = \{(x_0, x) \in K, x_n \leq 0\}$ and $K^d = \{(x_0, x) \in K, x_n \geq 0\}$. We then denote by $\mathcal{C}_c^\infty(K^g)$ (resp. $\mathcal{C}_c^\infty(K^d)$) the space of functions that are \mathcal{C}^∞ in $\overline{\mathbf{R}}_-^{n+1}$ (resp. $\overline{\mathbf{R}}_+^{n+1}$) with support in K^g (resp. K^d).

We let φ be a (weight) function in all variables. We shall “observe” the solution of the elliptic equation $Aw = f$ on the side $x_n > 0$ and thus choose $\partial_{x_n} \varphi(x_0, x', x_n = 0^\pm) > 0$. We shall consider three cases in order to treat the general case:

Case 1: $c(y', y_n = 0^-) < c(y', y_n = 0^+)$,

Case 2: $c(y', y_n = 0^-) = c(y', y_n = 0^+)$,

Case 3: $c(y', y_n = 0^-) > c(y', y_n = 0^+)$.

Recall that Case 3 is the case for which controllability and global Carleman estimates were obtained in [DOP02].

On both sides of S we define $A_\varphi = h^2 e^{\varphi/h} A_2 e^{-\varphi/h}$. Considered as a semi-classical differential operator we denote by a_φ its principal symbol, which is given by

$$a_\varphi = (\xi_0 + i\partial_{x_0}\varphi)^2 + c(x) \left((\xi_n + i\partial_{x_n}\varphi)^2 + r(x, \xi' + i\partial_{x'}\varphi) \right).$$

We make the following assumption.

Assumption 2.1. *The weight function $\varphi(x_0, x)$ is in $\mathcal{C}(\bar{V})$ and $\varphi|_{\mathbf{R}_+^{n+1}} \in \mathcal{C}^\infty(\bar{V}_d^{\mathbb{R}})$ and satisfies $|\nabla_{(x_0, x)}\varphi| > 0$ in \bar{V} . We assume*

$$\forall x_0, x', \quad \partial_{x_n}\varphi(x_0, x', x_n = 0^+) > 0, \quad \partial_{x_n}\varphi(x_0, x', x_n = 0^+) - \partial_{x_n}\varphi(x_0, x', x_n = 0^-) \geq C > 0,$$

$$(2.2) \quad (c\partial_{x_n}\varphi)(x_0, x', x_n = 0^+) - (c\partial_{x_n}\varphi)(x_0, x', x_n = 0^-) \geq 0.$$

The function φ satisfies the sub-ellipticity condition

$$(2.3) \quad \forall (x_0, x, \xi_0, \xi) \in \bar{V}_d^{\mathbb{R}} \times \mathbf{R}^{n+1}, \quad a_\varphi(x_0, x, \xi_0, \xi) = 0 \Rightarrow \{\operatorname{Re} a_\varphi, \operatorname{Im} a_\varphi\}(x, \xi) > 0.$$

Case 1: *The neighborhood V is chosen sufficiently small such that*

$$c(x', x_n = 0^+) - c(x', x_n = 0^-) \geq C > 0, \quad x' \in \bar{V}_{y'}.$$

Moreover we assume

$$(2.4) \quad \forall x_0, x', \quad (\partial_{x_n}\varphi(x_0, x', x_n = 0^+))^2 - (\partial_{x_n}\varphi(x_0, x', x_n = 0^-))^2 - (\partial_{x_0}\varphi(x_0, x', x_n = 0))^2 \left(\frac{1}{c(x', x_n = 0^-)} - \frac{1}{c(x', x_n = 0^+)} \right) \geq C > 0.$$

Case 2: *The neighborhood V is chosen sufficiently small such that $|c(x', x_n = 0^-) - c(x', x_n = 0^+)|$ is itself sufficiently small.*

Case 3: *The neighborhood V is chosen sufficiently small such that*

$$c(x', x_n = 0^+) - c(x', x_n = 0^-) \leq -C < 0, \quad x' \in \bar{V}_{y'}.$$

Moreover we assume

$$(2.5) \quad \forall x_0, x', \quad \frac{(c(x', x_n = 0^+))^2}{c(x', x_n = 0^-)} (\partial_{x_n}\varphi(x_0, x', x_n = 0^+))^2 - c(x', x_n = 0^-) r(x', x_n = 0, \partial_{x'}\varphi(x_0, x', x_n = 0)) \geq K,$$

where K is some positive constant and

$$(2.6) \quad \forall x_0, x', \quad C_1 \left(1 - \frac{c(x', x_n = 0^+)}{c(x', x_n = 0^-)} \right) \left(\frac{1}{((c\partial_{x_n}\varphi)(x_0, x', x_n = 0^-))^2} - \frac{1}{((c\partial_{x_n}\varphi)(x_0, x', x_n = 0^+))^2} \right) - C_2^2 (\partial_{x_0}\varphi)^2(x_0, x', x_n = 0) \left(\frac{1}{(c(\partial_{x_n}\varphi)^2)(x_0, x', x_n = 0^-)} - \frac{1}{(c(\partial_{x_n}\varphi)^2)(x_0, x', x_n = 0^+)} \right) \Bigg|_{x_n=0^+} \geq 0,$$

where C_1 and C_2 are the constants in (2.1).

Note that φ is chosen continuous across the interface. In particular, we have

$$\partial_{x_0}\varphi|_{x_n=0^-} = \partial_{x_0}\varphi|_{x_n=0^+}, \quad \partial_{x'}\varphi|_{x_n=0^-} = \partial_{x'}\varphi|_{x_n=0^+},$$

which we shall simply write $\partial_{x_0}\varphi|_{x_n=0^+}$ and $\partial_{x'}\varphi|_{x_n=0^+}$ respectively in the sequel.

The conditions we impose on the weight function φ will make sense in the course of the proof of Proposition 2.7 below. In Section 3 we shall construct a weight function that satisfies the properties listed in Assumption 2.1.

From the assumption made on the weight function φ we shall obtain the following local Carleman estimate.

Theorem 2.2. *Let K be a compact subset of V . Let the coefficient $c(x)$ satisfy Cases 1, 2 or 3. With the weight function φ satisfying Assumption 2.1 in \bar{V} , there exist $C > 0$ and $h_0 > 0$ such that*

$$(2.7) \quad h\|e^{\varphi/h}w\|_0^2 + h^3\|e^{\varphi/h}\nabla_{x_0,x}w\|_0^2 + h|e^{\varphi/h}w|_{x_n=0^\pm}|_0^2 + h^3|e^{\varphi/h}\partial_{x_0,x'}w|_{x_n=0^\pm}|_0^2 + h^3|e^{\varphi/h}\partial_{x_n}w|_{x_n=0^\pm}|_0^2 \\ \leq C\left(h^4\|e^{\varphi/h}f\|_0^2 + h|e^{\varphi/h}\theta|_0^2 + h^3|e^{\varphi/h}\partial_{x_0,x'}\theta|_0^2 + h^3|e^{\varphi/h}\Theta|_0^2\right), \quad 0 < h \leq h_0,$$

for w satisfying (TC), $w|_{\mathbf{R}_+^{n+1}} \in \mathcal{C}_c^\infty(K^{\text{gl}})$ and where $f = A_2w$ in $V \setminus S$.

Remark 2.3. This Carleman estimate yields the same estimate for the operator A making use of the insensitivity of such estimates to changes of variables and to additional lower-order terms.

The remainder of this section is devoted to the proof of Theorem 2.2.

2.1. Preliminaries. We assume that the function w satisfies (TC) and $A_2w = f$. Following [Bel03], we shall consider the transmission problem as a system of two equations on V^d coupled at the boundary $x_n = 0^+$. We thus make the change of variables x_n to $-x_n$ in V^g . This yields the following system in V^d :

$$(2.8) \quad \begin{cases} \left(-\frac{1}{c^g(x)}\partial_{x_0}^2 - (\partial_{x_n}^2 - r^g(x, \partial_{x'}/i))\right) w^g = F^g = \frac{1}{c^g(x)}f^g, \\ \left(-\frac{1}{c^d(x)}\partial_{x_0}^2 - (\partial_{x_n}^2 - r^d(x, \partial_{x'}/i))\right) w^d = F^d = \frac{1}{c^d(x)}f^d, \end{cases}$$

with

$$(TC^*) \quad w^g|_{x_n=0^+} = w^d|_{x_n=0^+} + \theta, \quad c^g\partial_{x_n}w^g|_{x_n=0^+} + c^d\partial_{x_n}w^d|_{x_n=0^+} = \Theta,$$

where for a function ψ defined in V , we set $\psi^d := \psi|_{V^d}$ and $\psi^g(x', x_n) = \psi(x', -x_n)$ for $x_n > 0$. In particular, we have $r^g(x, \partial_{x'}/i) = r(x', -x_n, \partial_{x'}/i)$, and $r^d(x, \partial_{x'}/i) = r(x, \partial_{x'}/i)$ for $x_n > 0$. If there is no possible confusion, we shall now write $\psi = {}^t(\psi^g, \psi^d)$. From Assumption 2.1 we have

$$(2.9) \quad \partial_{x_n}\varphi^g(x_0, x', x_n = 0) < 0, \quad \partial_{x_n}\varphi^d(x_0, x', x_n = 0) > 0,$$

and

$$(2.10) \quad c^g\partial_{x_n}\varphi^g(x_0, x', x_n = 0) + c^d\partial_{x_n}\varphi^d(x_0, x', x_n = 0) \geq 0.$$

Observe also that condition (2.3) is preserved since $\{\text{Re } a_\varphi, \text{Im } a_\varphi\}$ is invariant under a change of variables [Hör63, Section 8.1, page 186].

We denote by $p^{\mathbb{H}_d}$ the symbols of the operators acting on $w^{\mathbb{H}_d}$ in (2.8). We set $P(x_0, x, D_{x_0}, D_x) := \text{Op}(\text{diag}(p^g, p^d))$ and $\Phi := \text{diag}(\varphi^g, \varphi^d)$. We set $v = {}^t(v^g, v^d)$. For $v = e^{\Phi/h} w$, the entries of v satisfy the following boundary condition

$$(\text{TC}_\varphi) \quad v^g|_{x_n=0^+} = v^d|_{x_n=0^+} + \theta_\varphi, \quad c^g(D_{x_n} + i\partial_{x_n}\varphi^g)v^g|_{x_n=0^+} + c^d(D_{x_n} + i\partial_{x_n}\varphi^d)v^d|_{x_n=0^+} = \Theta_\varphi,$$

where

$$(2.11) \quad \theta_\varphi = e^{\varphi/h}|_{x_n=0^+} \theta \quad \text{and} \quad \Theta_\varphi = \frac{h}{i} e^{\varphi/h}|_{x_n=0^+} \Theta.$$

We define the following conjugated operator $P_\varphi = h^2 e^{\Phi/h} P e^{-\Phi/h}$, which we shall, in the sequel, treat as a second-order semi-classical differential operator, with h as the small parameter. The principal symbol of P_φ is given by

$$p_\varphi(x_0, x, \xi_0, \xi', \xi_n) = \text{diag}(p_\varphi^g(x_0, x, \xi_0, \xi', \xi_n), p_\varphi^d(x_0, x, \xi_0, \xi', \xi_n)),$$

with

$$p_\varphi^{\mathbb{H}_d}(x_0, x, \xi_0, \xi', \xi_n) = \frac{1}{c^{\mathbb{H}_d}} (\xi_0 + i\partial_{x_0}\varphi^{\mathbb{H}_d})^2 + (\xi_n + i\partial_{x_n}\varphi^{\mathbb{H}_d})^2 + r^{\mathbb{H}_d}(x, \xi' + i\partial_{x'}\varphi^{\mathbb{H}_d}).$$

For the sake of concision, we shall often omit the time and spacial variables in the functions $c^{\mathbb{H}_d}$ and $\varphi^{\mathbb{H}_d}$, as we have just done, when there is no possible confusion. Separating the real and imaginary parts of the principal symbol, we write $p_\varphi^{\mathbb{H}_d} = \tilde{q}_2^{\mathbb{H}_d} + i\tilde{q}_1^{\mathbb{H}_d}$, and following [LR95] we set

$$\tilde{q}_2^{\mathbb{H}_d} = \xi_n^2 + q_2^{\mathbb{H}_d}, \quad \tilde{q}_1^{\mathbb{H}_d} = 2\partial_{x_n}\varphi^{\mathbb{H}_d}\xi_n + 2q_1^{\mathbb{H}_d},$$

with

$$\begin{aligned} q_2^{\mathbb{H}_d}(x_0, x, \xi_0, \xi') &= -(\partial_{x_n}\varphi^{\mathbb{H}_d})^2 + \frac{1}{c^{\mathbb{H}_d}} \left(\xi_0^2 - (\partial_{x_0}\varphi^{\mathbb{H}_d})^2 \right) + r^{\mathbb{H}_d}(x, \xi') - r^{\mathbb{H}_d}(x, \partial_{x'}\varphi^{\mathbb{H}_d}), \\ q_1^{\mathbb{H}_d}(x_0, x, \xi_0, \xi') &= \frac{1}{c^{\mathbb{H}_d}} \partial_{x_0}\varphi^{\mathbb{H}_d}\xi_0 + \tilde{r}^{\mathbb{H}_d}(x, \xi', \partial_{x'}\varphi^{\mathbb{H}_d}), \end{aligned}$$

where $\tilde{r}^{\mathbb{H}_d}(x, \xi', \eta')$ are the symmetric bilinear forms in ξ', η' associated to the real quadratic forms $r^{\mathbb{H}_d}(x, \xi')$.

2.2. Signs of the imaginary part of the two roots of $p_\varphi^{\mathbb{H}_d}$. At $x_n = 0^+$, the polynomials (in ξ_n) $p_\varphi^{\mathbb{H}_d}(x_0, x, \xi_0, \xi', \xi_n)$ have two complex roots. Depending on the signs of the imaginary parts of the two roots of the two polynomials, we shall adopt different strategies for the proof of partial Carleman estimates. By “partial” we actually mean that the resulting estimate will only hold in some microlocal region. Once collected together, the partial estimates will yield the result of Theorem 2.2.

Following [LR97], we set

$$(2.12) \quad \mu^{\mathbb{H}_d}(x_0, x, \xi_0, \xi') := q_2^{\mathbb{H}_d}(x_0, x, \xi_0, \xi') + \frac{(q_1^{\mathbb{H}_d}(x_0, x, \xi_0, \xi'))^2}{(\partial_{x_n}\varphi^{\mathbb{H}_d})^2},$$

and define

$$\begin{aligned}\mathcal{E}_{d,+}^{\mathfrak{g}_d} &:= \{(x_0, x, \xi_0, \xi') \in V^d \times \mathbf{R}^n; \mu^{\mathfrak{g}_d}(x_0, x, \xi_0, \xi') > 0\}, \\ \mathcal{E}_{d,-}^{\mathfrak{g}_d} &:= \{(x_0, x, \xi_0, \xi') \in V^d \times \mathbf{R}^n; \mu^{\mathfrak{g}_d}(x_0, x, \xi_0, \xi') < 0\}, \\ \mathcal{F}^{\mathfrak{g}_d} &:= \{(x_0, x, \xi_0, \xi') \in V^d \times \mathbf{R}^n; \mu^{\mathfrak{g}_d}(x_0, x, \xi_0, \xi') = 0\}.\end{aligned}$$

Remark 2.4. The regions $\mathcal{E}_{d,-}^{\mathfrak{g}_d}$ and $\mathcal{F}^{\mathfrak{g}_d}$ are bounded. Hence, for $|(\xi_0, \xi')|$ sufficiently large, say $|(\xi_0, \xi')| > R$, then $(x_0, x, \xi_0, \xi') \in \mathcal{E}_{g,+}^{\mathfrak{g}} \cap \mathcal{E}_{d,+}^{\mathfrak{g}_d}$, with $\text{dist}((x_0, x, \xi_0, \xi'), \mathcal{F}^{\mathfrak{g}_d}) \geq C > 0$.

The following lemma is proven in [LR97, proof of Lemma 3].

Lemma 2.5. *In the region $\mathcal{E}_{d,+}^{\mathfrak{g}_d}$, the polynomials $p_{\varphi}^{\mathfrak{g}_d}$ have two distinct roots $\rho_{d,+}^{\mathfrak{g}_d}$ and $\rho_{d,-}^{\mathfrak{g}_d}$ that satisfy $\text{Im} \rho_{d,+}^{\mathfrak{g}_d} > 0$ and $\text{Im} \rho_{d,-}^{\mathfrak{g}_d} < 0$. In the region $\mathcal{E}_{d,-}^{\mathfrak{g}_d}$, the imaginary parts of the two roots have the same sign as that of $-\partial_{x_n} \varphi^{\mathfrak{g}_d}$. In $\mathcal{F}^{\mathfrak{g}_d}$, one of the roots is real.*

Hence, for the polynomial p_{φ}^d , for $|(\xi_0, \xi')| > R$, there are two roots, $\rho^{d,+}$ and $\rho^{d,-}$ with $\text{Im} \rho^{d,+} > 0$ and $\text{Im} \rho^{d,-} < 0$. As the value of μ^d decreases, the root $\rho^{d,+}$ moves towards the real axis, and crosses it in the region \mathcal{F}^d . In the region $\mathcal{E}_{d,-}^d$ the two roots both have *negative* imaginary parts.

For the polynomial p_{φ}^g , for $|(\xi_0, \xi')| > R$, there are two roots, $\rho^{g,+}$ and $\rho^{g,-}$ with $\text{Im} \rho^{g,+} > 0$ and $\text{Im} \rho^{g,-} < 0$. As the value of μ^g decreases, the root $\rho^{g,-}$ moves towards the real axis, and crosses it in the region \mathcal{F}^g . In the region $\mathcal{E}_{g,-}^g$ the two roots both have *positive* imaginary parts. The “motion” of the roots of p_{φ}^g and p_{φ}^d is illustrated in Figure 1.

Remark 2.6. From the proof of Lemma 3 in [LR97], we see that $\mu^{\mathfrak{g}_d} \geq C > 0$ is equivalent to having $\text{Im} \rho_{d,+}^{\mathfrak{g}_d} \geq C' > 0$ and $\text{Im} \rho_{d,-}^{\mathfrak{g}_d} \leq -C'$.

With the choice of weight function φ made in Assumption 2.1 we have the following proposition.

Proposition 2.7. *The properties of the weight function φ imply $\mathcal{E}_{d,+}^d \subset \mathcal{E}_{g,+}^g$, and $\text{dist}(\mathcal{E}_{d,+}^d, \mathcal{F}^g) \geq C > 0$, if the neighborhood V_y of y is chosen sufficiently small.*

The result of the proposition implies that the root $\rho^{d,+}$ crosses the real axis before the root $\rho^{g,-}$ does, as μ^d decreases from positive to negative values. This is illustrated in Figure 1. We enforce this root configuration because of the techniques we shall use to prove partial Carleman estimates.

In the case where the roots of the polynomial are separated by the real axis, or in the case where they are both in the lower open half plane, we can apply the Calderón-projector technique to the associated differential operator. The first case occurs for $P_{\varphi}^{\mathfrak{g}_d}$ in regions $\mathcal{E}_{d,+}^{\mathfrak{g}_d}$. The second case can only occur for P_{φ}^d in the region $\mathcal{E}_{d,-}^d$. In such regions, the Calderón-projector technique in fact yields an additional boundary condition at $x_n = 0^+$.

In fact, the choice of weight function φ we have made excludes the situation in which $\text{Im} \rho^{g,\pm} > 0$ and the root $\rho^{d,+}$ may cross the real axis. In such a case, the Calderón projector technique cannot be used for

Figure 1: The root $\rho^{d,+}$ crosses the real axis before the root $\rho^{g,-}$ does, as μ^d decreases.

P_φ^g or P_φ^d . The classical Carleman technique then yields a quadratic form for the traces of v and its normal derivative $D_{x_n} v$ which is of unknown or negative sign, which prevents the derivation of a proper Carleman type estimate.

Proof of Proposition 2.7. The result is clear in the case $|(\xi_0, \xi')| > R$ by Remark 2.4. We shall thus only consider the case $|(\xi_0, \xi')| \leq R$. We set $W = \{(x_0, x', \xi_0, \xi') \in [s - \varepsilon, s + \varepsilon] \times \bar{V}_{Y'} \times \mathbf{R}^n; |(\xi_0, \xi')| \leq R\}$. A sufficient condition to prove the result is then

$$(2.13) \quad \mu^g(x_0, x, \xi_0, \xi')|_{x_n=0^+} - \mu^d(x_0, x, \xi_0, \xi')|_{x_n=0^+} \geq C > 0, \quad (x_0, x', \xi_0, \xi') \in W.$$

In fact, since W is compact, by choosing V sufficiently small in the x_n -direction, this inequality remains valid in $V^d \times \mathbf{R}^n \cap \{|(\xi_0, \xi')| \leq R\}$ and the result follows.

We first treat Case 1. Observing that

$$\begin{aligned} r^d(x, \partial_{x'} \varphi^d)|_{x_n=0^+} &= r^g(x, \partial_{x'} \varphi^g)|_{x_n=0^+}, \\ \tilde{r}(x, \xi', \partial_{x'} \varphi)|_{x_n=0^+} &:= \tilde{r}^d(x, \xi', \partial_{x'} \varphi^d)|_{x_n=0^+} = \tilde{r}^g(x, \xi', \partial_{x'} \varphi^g)|_{x_n=0^+}, \end{aligned}$$

we obtain

$$\begin{aligned} (\mu^g - \mu^d)(x_0, x, \xi_0, \xi')|_{x_n=0^+} &= (\partial_{x_n} \varphi^d|_{x_n=0^+})^2 - (\partial_{x_n} \varphi^g|_{x_n=0^+})^2 + (\xi_0^2 - (\partial_{x_0} \varphi|_{x_n=0^+})^2) \left(\frac{1}{c^g} - \frac{1}{c^d} \right) \Big|_{x_n=0^+} \\ &\quad + \left(\frac{(\frac{1}{c^g} \xi_0 \partial_{x_0} \varphi|_{x_n=0^+} + \tilde{r}(x, \xi', \partial_{x'} \varphi)|_{x_n=0^+})}{\partial_{x_n} \varphi^g|_{x_n=0^+}} \right)^2 - \left(\frac{(\frac{1}{c^d} \xi_0 \partial_{x_0} \varphi|_{x_n=0^+} + \tilde{r}(x, \xi', \partial_{x'} \varphi)|_{x_n=0^+})}{\partial_{x_n} \varphi^d|_{x_n=0^+}} \right)^2, \end{aligned}$$

which, after expansion, we write

$$\begin{aligned}
 (2.14) \quad (\mu^g - \mu^d)(x_0, x, \xi_0, \xi')|_{x_n=0^+} &= (\partial_{x_n} \varphi^d|_{x_n=0^+})^2 - (\partial_{x_n} \varphi^g|_{x_n=0^+})^2 - (\partial_{x_0} \varphi|_{x_n=0^+})^2 \left(\frac{1}{c^g} - \frac{1}{c^d} \right) \Big|_{x_n=0^+} \\
 &+ \xi_0^2 \left(\left(\frac{1}{c^g} - \frac{1}{c^d} \right) \Big|_{x_n=0^+} + (\partial_{x_0} \varphi|_{x_n=0^+})^2 \left(\frac{1}{(c^g \partial_{x_n} \varphi^g)^2} - \frac{1}{(c^d \partial_{x_n} \varphi^d)^2} \right) \Big|_{x_n=0^+} \right) \\
 &+ (\tilde{r}(x, \xi', \partial_{x'} \varphi)|_{x_n=0^+})^2 \left(\frac{1}{(\partial_{x_n} \varphi^g)^2} - \frac{1}{(\partial_{x_n} \varphi^d)^2} \right) \Big|_{x_n=0^+} \\
 &+ 2 \xi_0 \tilde{r}(x, \xi', \partial_{x'} \varphi) \partial_{x_0} \varphi|_{x_n=0^+} \left(\frac{1}{c^g (\partial_{x_n} \varphi^g)^2} - \frac{1}{c^d (\partial_{x_n} \varphi^d)^2} \right) \Big|_{x_n=0^+}.
 \end{aligned}$$

The first line in (2.14) is larger than some positive constant by (2.4) in Assumption 2.1–Case 1. The last three lines in (2.14) can be viewed as a quadratic form in ξ_0 and $\tilde{r}(x, \xi', \partial_{x'} \varphi)|_{x_n=0^+}$. The determinant of the associated symmetric matrix is given by

$$\left(\frac{1}{c^g} - \frac{1}{c^d} \right) \frac{1}{(\partial_{x_n} \varphi^g)^2 (\partial_{x_n} \varphi^d)^2} \left((\partial_{x_n} \varphi^d)^2 - (\partial_{x_n} \varphi^g)^2 - (\partial_{x_0} \varphi)^2 \left(\frac{1}{c^g} - \frac{1}{c^d} \right) \right) \Big|_{x_n=0^+},$$

and is thus positive by (2.4). Since the coefficient in front of $\tilde{r}(x, \xi', \partial_{x'} \varphi)|_{x_n=0^+}$ in (2.14) is itself positive by Assumption 2.1, we find that the quadratic form is nonnegative. The sufficient condition (2.13) hence follows.

We now treat Case 2. We write

$$\begin{aligned}
 (2.15) \quad (\mu^g - \mu^d)(x_0, x, \xi_0, \xi')|_{x_n=0^+} &= (\partial_{x_n} \varphi^d|_{x_n=0^+})^2 - (\partial_{x_n} \varphi^g|_{x_n=0^+})^2 \\
 &+ \left(\frac{1}{c^d} \xi_0 \partial_{x_0} \varphi|_{x_n=0^+} + \tilde{r}(x, \xi', \partial_{x'} \varphi)|_{x_n=0^+} \right)^2 \left(\frac{1}{(\partial_{x_n} \varphi^g|_{x_n=0^+})^2} - \frac{1}{(\partial_{x_n} \varphi^d|_{x_n=0^+})^2} \right) \\
 &+ \left(\frac{1}{c^g} - \frac{1}{c^d} \right) \Big|_{x_n=0^+} \left(\xi_0^2 - (\partial_{x_0} \varphi|_{x_n=0^+})^2 + 2 \xi_0 \partial_{x_0} \varphi|_{x_n=0^+} \left(\tilde{r}(x, \xi', \partial_{x'} \varphi)|_{x_n=0^+} + \frac{\partial_{x_0} \varphi|_{x_n=0^+} \xi_0}{c^d|_{x_n=0^+}} \right) \right) \\
 &+ \frac{\left(\frac{1}{c^g} - \frac{1}{c^d} \right)^2 \Big|_{x_n=0^+}}{(\partial_{x_n} \varphi^g|_{x_n=0^+})^2} (\xi_0 \partial_{x_0} \varphi|_{x_n=0^+} \xi_0)^2.
 \end{aligned}$$

With $|(\xi_0, \xi')| \leq R$, we see that the last two terms in the previous expression can be made as small as desired by choosing the neighborhood $V_{y'}$ sufficiently small, which implies $|c(x', x_n = 0^-) - c(x', x_n = 0^+)|$ small. The sum of the first two terms in (2.15) is larger than some positive constant by the properties of φ in Assumption 2.1, which yields the conclusion.

We finally treat Case 3. Then $c^g|_{x_n=0^+} > c^d|_{x_n=0^+}$. In particular, note that

$$(2.16) \quad c^d (\partial_{x_n} \varphi^d)^2|_{x_n=0^+} \geq c^g (\partial_{x_n} \varphi^g)^2|_{x_n=0^+},$$

from Assumption 2.1. Observe that in this case we have

$$c^g q_2^g(x_0, x, \xi_0, \xi')|_{x_n=0^+} \geq \lambda(x_0, x', \xi_0, \xi'), \quad c^d q_2^d(x_0, x, \xi_0, \xi')|_{x_n=0^+} \geq \lambda(x_0, x', \xi_0, \xi'),$$

where

$$\lambda(x_0, x', \xi_0, \xi') = \xi_0^2 - (\partial_{x_0} \varphi)^2 - c^d (\partial_{x_n} \varphi^d)^2 \Big|_{x_n=0^+} + c^d r(x, \xi') \Big|_{x_n=0^+} - c^g r(x, \partial_{x'} \varphi) \Big|_{x_n=0^+}.$$

Let K be the constant appearing in (2.5). In the case $\lambda(x_0, x', \xi_0, \xi') > K/2$, then locally, for $x_n \geq 0$, $|x_n|$ small, this remains valid with $K/2$ changed into $K/4$. Locally, we thus have $\mu^g \geq K/(4c_{\max}) > 0$ and $\mu^d \geq K/(4c_{\max}) > 0$, from the definitions of $\mu^{\frac{g}{d}}$ in (2.12). In the region $\lambda(x_0, x', \xi_0, \xi') > K/2$ the result is hence clear.

We now treat the region $\lambda(x_0, x', \xi_0, \xi') \leq K/2$. By choosing the neighborhood V sufficiently small, arguing as above, it is now sufficient to prove that

$$\mu^g(x_0, x, \xi_0, \xi') \Big|_{x_n=0^+} - \mu^d(x_0, x, \xi_0, \xi') \Big|_{x_n=0^+} \geq C > 0, \quad (x_0, x', \xi_0, \xi') \in \widetilde{W},$$

where $\widetilde{W} = W \cap \{(x_0, x', \xi_0, \xi'); \lambda(x_0, x', \xi_0, \xi') \leq K/2\}$ which is compact. From Assumption 2.1, we observe that we have

$$(\partial_{x_n} \varphi^d \Big|_{x_n=0^+})^2 - (\partial_{x_n} \varphi^g \Big|_{x_n=0^+})^2 \geq (c^d)^2 \left(\frac{1}{c^d} + \frac{1}{c^g} \right) \left(\frac{1}{c^d} - \frac{1}{c^g} \right) \Big|_{x_n=0^+} (\partial_{x_n} \varphi^d \Big|_{x_n=0^+})^2.$$

With $\lambda(x_0, x', \xi_0, \xi') \leq K/2$ in \widetilde{W} , we then obtain

$$(2.17) \quad \begin{aligned} (\mu^g - \mu^d)(x_0, x, \xi_0, \xi') \Big|_{x_n=0^+} &= Q + \xi_0^2 (\partial_{x_0} \varphi \Big|_{x_n=0^+})^2 \left(\frac{1}{(c^g \partial_{x_n} \varphi^g)^2} - \frac{1}{(c^d \partial_{x_n} \varphi^d)^2} \right) \Big|_{x_n=0^+} \\ &\quad + (\tilde{r}(x, \xi', \partial_{x'} \varphi))^2 \Big|_{x_n=0^+} \left(\frac{1}{(\partial_{x_n} \varphi^g)^2} - \frac{1}{(\partial_{x_n} \varphi^d)^2} \right) \Big|_{x_n=0^+} \\ &\quad + 2 \xi_0 \tilde{r}(x, \xi', \partial_{x'} \varphi) \partial_{x_0} \varphi \Big|_{x_n=0^+} \left(\frac{1}{c^g (\partial_{x_n} \varphi^g)^2} - \frac{1}{c^d (\partial_{x_n} \varphi^d)^2} \right) \Big|_{x_n=0^+}, \end{aligned}$$

where

$$\begin{aligned} Q &\geq \left(\frac{1}{c^d} - \frac{1}{c^g} \right) \Big|_{x_n=0^+} \left\{ \frac{(c^d)^2}{c^g} \Big|_{x_n=0^+} (\partial_{x_n} \varphi^d \Big|_{x_n=0^+})^2 + c^d r(x, \xi') \Big|_{x_n=0^+} - c^g r(x, \partial_{x'} \varphi) \Big|_{x_n=0^+} - K/2 \right\} \\ &\geq \left(\frac{1}{c^d} - \frac{1}{c^g} \right) \Big|_{x_n=0^+} (K/2 + c^d r(x, \xi') \Big|_{x_n=0^+}) \geq \left(\frac{1}{c^d} - \frac{1}{c^g} \right) \Big|_{x_n=0^+} (K/2 + C_1 (c^d \Big|_{x_n=0^+}) |\xi'|^2), \end{aligned}$$

by (2.5) in Assumption 2.1 and where C_1 is the uniform-ellipticity constant appearing in (2.1). As we have

$$|\tilde{r}(x, \xi', \partial_{x'} \varphi) \Big|_{x_n=0^+}| \leq C_2 |\xi'| |\partial_{x'} \varphi \Big|_{x_n=0^+}|,$$

with C_2 also appearing in (2.1), we obtain

(2.18)

$$\begin{aligned} (\mu^g - \mu^d)(x_0, x, \xi_0, \xi')|_{x_n=0^+} &\geq \left(\frac{1}{c^d} - \frac{1}{c^g} \right) \Big|_{x_n=0^+} K/2 + \xi_0^2 (\partial_{x_0} \varphi|_{x_n=0^+})^2 \left(\frac{1}{(c^g \partial_{x_n} \varphi^g)^2} - \frac{1}{(c^d \partial_{x_n} \varphi^d)^2} \right) \Big|_{x_n=0^+} \\ &\quad + C_1 c^d \left(\frac{1}{c^d} - \frac{1}{c^g} \right) \Big|_{x_n=0^+} |\xi'|^2 \\ &\quad - 2C_2 |\partial_{x_0} \varphi|_{x_n=0^+} |\partial_{x'} \varphi|_{x_n=0^+} |\xi_0| |\xi'| \left(\frac{1}{c^g (\partial_{x_n} \varphi^g)^2} - \frac{1}{c^d (\partial_{x_n} \varphi^d)^2} \right) \Big|_{x_n=0^+}, \end{aligned}$$

since the third term in the r.h.s. of (2.17) is nonnegative by Assumption 2.5. Next, we consider the last three terms in (2.18) as a quadratic form in $|\xi'|$ and ξ_0 . The coefficients associated to ξ_0^2 and $|\xi'|^2$ are nonnegative. The result of the proposition follows if the quadratic form is nonnegative, that is, if its determinant is itself nonnegative. The determinant is given by

$$\begin{aligned} (\partial_{x_0} \varphi|_{x_n=0^+})^2 &\left\{ C_1 \left(1 - \frac{c^d}{c^g} \right) \Big|_{x_n=0^+} \left(\frac{1}{(c^g \partial_{x_n} \varphi^g)^2} - \frac{1}{(c^d \partial_{x_n} \varphi^d)^2} \right) \Big|_{x_n=0^+} \right. \\ &\quad \left. - C_2^2 (\partial_{x_0} \varphi|_{x_n=0^+})^2 \left(\frac{1}{c^g (\partial_{x_n} \varphi^g)^2} - \frac{1}{c^d (\partial_{x_n} \varphi^d)^2} \right)^2 \Big|_{x_n=0^+} \right\}, \end{aligned}$$

and is nonnegative by (2.6) in Assumption 2.1–Case 3. \blacksquare

Remark 2.8. Because of the controllability result we aim to prove in this article, we have considered the elliptic operator $A := -\partial_{x_0}^2 - L$, with the additional variable x_0 . The Carleman estimate of Theorem 2.2 also holds for the operator $L = \nabla_x \cdot (c(x) \nabla_x)$. In this case, we simply assume that the weight function satisfies

$$\forall x_0, x', \quad \partial_{x_n} \varphi(x_0, x', x_n = 0^\pm) > 0, \quad \partial_{x_n} \varphi(x_0, x', x_n = 0^+) - \partial_{x_n} \varphi(x_0, x', x_n = 0^-) \geq C > 0.$$

In fact, in this case, after dividing by $c(x)$ on both sides of the interface S as above, the symbols $q_2^{\mathcal{H}}$ and $q_1^{\mathcal{H}}$ reduce to

$$q_2^{\mathcal{H}}(x, \xi') = -(\partial_{x_n} \varphi^{\mathcal{H}})^2 + r^{\mathcal{H}}(x, \xi') - r^{\mathcal{H}}(x, \partial_{x'} \varphi^{\mathcal{H}}), \quad q_1^{\mathcal{H}}(x, \xi') = \tilde{r}^{\mathcal{H}}(x, \xi', \partial_{x'} \varphi^{\mathcal{H}}).$$

We then have

$$\begin{aligned} \mu^g(x, \xi')|_{x_n=0^+} - \mu^d(x, \xi')|_{x_n=0^+} &= ((\partial_{x_n} \varphi^d|_{x_n=0^+})^2 - (\partial_{x_n} \varphi^g|_{x_n=0^+})^2) \left(1 + \frac{\tilde{r}(x, \xi', \partial_{x'} \varphi)^2|_{x_n=0^+}}{(\partial_{x_n} \varphi^d|_{x_n=0^+})^2 (\partial_{x_n} \varphi^g|_{x_n=0^+})^2} \right) \\ &\geq C > 0 \end{aligned}$$

with the assumptions on φ we just wrote. We can then use the same argument as in the proof of Proposition 2.7 and prove that the result of this proposition also holds in this case. The rest of the proof of Theorem 2.2 below remains unchanged. More generally, for other elliptic operators, the result of Theorem 2.2 holds if we can choose a weight function that yields the result of Proposition 2.7.

In particular, the Carleman estimate in Theorem 2.2 provides a quantitative result for the unique continuation property across the interface S (See for instance [Hör63] or [Zui83]).

2.3. Estimate in the region $\mathcal{E}^{d,+}$. With a microlocal cut-off, we place ourselves in the region $\mathcal{E}^{d,+}$, hence in $\mathcal{E}^{g,+}$ by Proposition 2.7, and finitely away from \mathcal{J}^d (and thus \mathcal{J}^g). Making use of the Calderón-projector technique we shall prove the following partial Carleman estimate.

Proposition 2.9. *Let K be a compact subset of V . Let $\chi^+(x_0, x, \xi_0, \xi') \in S_{\mathcal{T}}^0$ with a compact support w.r.t. (x_0, x) contained in V , such that in the support of χ^+ we have $\mu^d(x_0, x, \xi_0, \xi') \geq C > 0$. With the weight function φ satisfying Assumption 2.1, there exist $C > 0$ and $h_1 > 0$ such that*

$$(2.19) \quad \|\text{op}(\chi^+)v\|_1 + h^{\frac{1}{2}}|\text{op}(\chi^+)v|_{x_n=0^+}|_1 + h^{\frac{1}{2}}|\text{op}(\chi^+)D_{x_n}v|_{x_n=0^+}|_0 \\ \leq C \left(\|P_\varphi v\|_0 + h\|v\|_1 + h^2|D_{x_n}v|_{x_n=0^+}|_0 + h^{\frac{1}{2}}|\theta_\varphi|_1 + h^{\frac{1}{2}}|\Theta_\varphi|_0 \right),$$

for $0 < h \leq h_1$, and for $v = {}^t(v^g, v^d)$, $v^g, v^d \in \mathcal{C}_c^\infty(K^d)$ and satisfying (TC $_\varphi$).

The proof we give follows that of Lemma 4 in [LR97] and the notation used therein. We reproduce some of the arguments of [LR97] to have a self-contained proof of Proposition 2.9. Note that the first term in the partial estimate (2.19) differs from the equivalent term in the Carleman estimate (2.7) by a factor $h^{\frac{1}{2}}$. Here, a “better” estimate is actually obtained because we have restricted ourselves microlocally to an ellipticity region of the symbol p_φ . The Carleman estimate (2.7), for the second-order operator A_2 , in fact corresponds to a sub-elliptic estimate.

Proof. In $\text{supp}(\chi^+)$, we have

$$\text{Im} \rho^{\mathcal{E}^{d,+}} \geq C > 0, \quad \text{Im} \rho^{\mathcal{E}^{d,-}} \leq -C < 0,$$

by Lemma 2.5 and remark 2.6. Moreover, $\chi^+ \rho^{\mathcal{E}^{d,+}}$ and $\chi^+ \rho^{\mathcal{E}^{d,-}}$ are in $S_{\mathcal{T}}^1$.

We set $u = \text{op}(\chi^+)v$. Then, $P_\varphi u = g$ with $g = \text{op}(\chi^+)P_\varphi v + \underbrace{[P_\varphi, \text{op}(\chi^+)]v}_{\in h\Psi^1}$. In particular, we have

$$(2.20) \quad \|g\|_0 \leq C \left(\|P_\varphi v\|_0 + h\|v\|_1 \right).$$

The transmission conditions satisfied by u^g and u^d are

$$(TC_u) \quad u^g|_{x_n=0^+} = u^d|_{x_n=0^+} + \theta_{\varphi, \chi^+}, \quad c^g(D_{x_n} + i\partial_{x_n}\varphi^g)u^g|_{x_n=0^+} + c^d(D_{x_n} + i\partial_{x_n}\varphi^d)u^d|_{x_n=0^+} = G_1,$$

with $\theta_{\varphi, \chi^+} := \text{op}(\chi^+)\theta_\varphi|_{x_n=0^+}$ and

$$G_1 = \underbrace{[c^g(D_{x_n} + i\partial_{x_n}\varphi^g), \text{op}(\chi^+)]v^g|_{x_n=0^+}}_{\in h\Psi_{\mathcal{T}}^0} + \underbrace{[c^d(D_{x_n} + i\partial_{x_n}\varphi^d), \text{op}(\chi^+)]v^d|_{x_n=0^+}}_{\in h\Psi_{\mathcal{T}}^0} + \text{op}(\chi^+)\Theta_\varphi|_{x_n=0^+}$$

that satisfies

$$(2.21) \quad |G_1|_0 \leq Ch|v|_{x_n=0^+}|_0 + C|\Theta_\varphi|_0.$$

We denote by $\underline{\phi}$ the zero-extension of a function $\phi \in \mathcal{C}^\infty(V^d)$ to \mathbf{R}^{n+1} . We then have

$$P_\varphi \underline{u} = \underline{g} - h^2\gamma_0(u)\delta' + \frac{h}{i} \left(\gamma_1(u) - \text{op}(q_\rho)\gamma_0(u) \right) \delta, \quad \gamma_0(u) := u|_{x_n=0^+}, \quad \gamma_1(u) := D_{x_n}u|_{x_n=0^+},$$

where $\delta^{(j)} = \left(\frac{d}{dx_n}\right)^j \delta_{x_n=0}$, and $q_\rho = \text{diag}(\rho^{s,-} + \rho^{s,+}, \rho^{d,-} + \rho^{d,+})$ since $\rho^{g_d,+} + \rho^{g_d,-} = -2i \partial_{x_n} \varphi^{g_d}$. Setting

$$(2.22) \quad w_1 := \gamma_0(u), \quad \text{and} \quad w_0 = \gamma_1(u) - \text{op}(q_\rho) \gamma_0(u),$$

we write

$$(2.23) \quad P_\varphi \underline{u} = \underline{g} - h^2 w_1 \delta' + \frac{h}{i} w_0 \delta.$$

We now choose $\chi(x_0, x, \xi_0, \xi) \in S^0$ equal to one for sufficiently large $|(\xi_0, \xi)|$ as well as in a neighborhood of $\text{supp}(\chi^+)$ with moreover $\text{supp}(\chi) \cap \det(p_\varphi)^{-1}(\{0\}) = \emptyset$. These conditions are compatible from the choice made for $\text{supp}(\chi^+)$ and Proposition 2.7. From the ellipticity of p_φ on $\text{supp}(\chi)$, for large M , there exists a ψ DO $E_M = \text{Op}(e)$, with $e \in S^{-2}$, of the form $e = \sum_{j=0}^M h^j e_j$, with $e_j \in S^{-2-j}$ and $e_0^{g_d} = \chi/p_\varphi^{g_d}$, that satisfies

$$E_M \circ P_\varphi = \text{Op}(\chi) + h^{M+1} R_M, \quad R_M \in \Psi^{-1-M}.$$

Note that the parametrix construction yields the symbols $e_j^{g_d}$, $j = 0, \dots, M$, in the form of rational functions for large $|\xi_n|$, with $\rho^{g_d,+}$ and $\rho^{g_d,-}$ for only poles.

With such a parametrix E_M we obtain

$$(2.24) \quad \underline{u} = E_M \underline{g} + E_M \left(-h^2 w_1 \delta' + \frac{h}{i} w_0 \delta \right) + g_1, \quad g_1 = (\text{Id} - \text{Op}(\chi)) \underline{u} - h^{M+1} R_M \underline{u}.$$

We have the following lemma.

Lemma 2.10. *Let $\sigma(z, \zeta', h) \in S_{\mathcal{T}}^m$ and $\Sigma(z, \zeta, h) \in S^{-\infty}$ such that $\text{supp}(\sigma) \cap \text{supp}(\Sigma) = \emptyset$. Then*

$$\text{op}(\sigma) \circ \text{Op}(\Sigma) \in \bigcap_{N \in \mathbf{N}} h^N \Psi^{-N}, \quad \text{and} \quad \text{Op}(\Sigma) \circ \text{op}(\sigma) \in \bigcap_{N \in \mathbf{N}} h^N \Psi^{-N}.$$

Proof. We use the idea of the proof of Theorem 18.1.35 in [Hör85b]. From the remark preceding Theorem 18.1.17 in [Hör85b], adapted to semi-classical operators, we observe that

$$\text{op}(\sigma) \circ \text{Op}(\Sigma) e^{i\langle z, \zeta \rangle / h} = \text{op}(\sigma) \left(e^{iz_n \zeta_n / h} \Sigma(z, D_{z'}, \zeta_n, h) e^{i\langle z', \zeta' \rangle / h} \right) = e^{iz_n \zeta_n / h} (\text{op}(\sigma) \circ \Sigma(z, D_{z'}, \zeta_n, h)) e^{i\langle z', \zeta' \rangle / h},$$

where $\Sigma(z, D_{z'}, \zeta_n, h)$ denotes the tangential operator $\text{op}(\Sigma(z, \zeta, \zeta_n, h))$ with ζ_n as a parameter. Since $\langle \zeta' \rangle \leq \langle \zeta \rangle$, we indeed observe that, for all $N \in \mathbf{N}$, $\Sigma(z, \zeta, \zeta_n, h)$ is bounded in $S_{\mathcal{T}}^{-N}$ uniformly w.r.t. $\zeta_n \in \mathbf{R}^n$. We set $\lambda(z, \zeta', \zeta_n, h) := \sigma \#_{\mathcal{T}} \Sigma$ as given in the composition formula (1.3), with ζ_n as a parameter. We hence have $\text{op}(\sigma) \circ \text{Op}(\Sigma) e^{i\langle z, \zeta \rangle / h} = e^{i\langle z, \zeta \rangle / h} \lambda(z, \zeta, h)$.

With $\text{supp}(\sigma) \cap \text{supp}(\Sigma) = \emptyset$, for all $M \in \mathbf{N}$, we find

$$\begin{aligned} \lambda(z, \zeta, h) &= \frac{(-ih)^{M+1}}{(2\pi h)^n} \sum_{|\alpha|=M+1} \int_0^1 \frac{(M+1)(1-s)^M}{\alpha!} \iint e^{-i\langle t', \tau' \rangle / h} \\ &\quad \times \partial_{z'}^\alpha \sigma(z, \zeta' + \tau', h) \partial_{z'}^\alpha \Sigma(z' + st', z_n, \zeta', \zeta_n, h) dt' d\tau' ds. \end{aligned}$$

Note that for all $j \in \mathbf{N}$, $\partial_{z_n}^j \partial_{z'}^\alpha \sigma(z, \zeta', h)$ is in $S_{\mathcal{T}}^{m-|\alpha|}$, and that, for all $M', M'', j, k \in \mathbf{N}$, $\langle \zeta_n \rangle^{M'} \partial_{z_n}^j \partial_{z'}^k \partial_{z'}^\alpha \Sigma(z, \zeta, h)$ is bounded in $S_{\mathcal{T}}^{-M''}$ uniformly w.r.t. ζ_n in \mathbf{R} . It follows that $\langle \zeta_n \rangle^{M'} \partial_{z_n}^j \partial_{z'}^k \lambda(z, \zeta, h) \in h^N S_{\mathcal{T}}^{-N}$, for all $M', N, j, k \in \mathbf{N}$.

N. Since $\langle \zeta \rangle \leq \langle \zeta' \rangle \langle \zeta_n \rangle$, we see that $\lambda(z, \zeta, h)$ is a symbol in all variables and is in $\cap_{N \in \mathbf{N}} h^N S^{-N}$. We thus have $e^{i\langle z, \zeta \rangle/h} \lambda(z, \zeta, h) = \text{Op}(\lambda) e^{i\langle z, \zeta \rangle/h}$ and therefore find

$$\text{op}(\sigma) \circ \text{Op}(\Sigma) e^{i\langle z, \zeta \rangle/h} = \text{Op}(\lambda) e^{i\langle z, \zeta \rangle/h}, \quad \text{for all } \zeta \in \mathbf{R}^{n+1}.$$

Since both sides are continuous in $\mathcal{S}'(\mathbf{R}^{n+1})$ and linear combinations of exponential functions are dense in \mathcal{S}' , we obtain $\text{op}(\sigma) \circ \text{Op}(\Sigma) = \text{Op}(\lambda)$.

To treat the other case, i.e., $\text{Op}(\Sigma) \circ \text{op}(\sigma)$, we prove that $\text{op}(\sigma)^* \circ \text{Op}(\Sigma)^* \in \cap_{N \in \mathbf{N}} h^N \Psi^{-N}$. We denote by σ^* and Σ^* the symbols of $\text{op}(\sigma)^*$ and $\text{Op}(\Sigma)^*$. They are of the form

$$\sigma^* = \tilde{\sigma} + \sigma_\infty, \quad \tilde{\sigma} \in S_{\mathcal{T}}^m, \quad \sigma_\infty \in \cap_{N \in \mathbf{N}} h^N S_{\mathcal{T}}^{-N}, \quad \text{and} \quad \Sigma^* = \tilde{\Sigma} + \Sigma_\infty, \quad \tilde{\Sigma} \in S^{-\infty}, \quad \Sigma_\infty \in \cap_{N \in \mathbf{N}} h^N S^{-N},$$

where $\tilde{\sigma}$ and $\tilde{\Sigma}$ can be chosen such that $\text{supp}(\tilde{\sigma}) \cap \text{supp}(\tilde{\Sigma}) = \emptyset$ from the ψ DO calculus. This yields

$$\text{op}(\sigma)^* \circ \text{Op}(\Sigma)^* = \text{op}(\tilde{\sigma}) \circ \text{Op}(\tilde{\Sigma}) + \text{op}(\tilde{\sigma}) \circ \text{Op}(\Sigma_\infty) + \text{op}(\sigma_\infty) \circ \text{Op}(\Sigma_\infty) + \text{op}(\sigma_\infty) \circ \text{Op}(\tilde{\Sigma}).$$

The first term is treated as above. The other terms can be treated similarly with formula (1.3) for $M = 0$: for the second and third terms we use that for all $M', M'', j, k \in \mathbf{N}$, $\langle \zeta_n \rangle^{M'} \partial_{z_n}^j \partial_{\zeta_n}^k \Sigma_\infty(z, \zeta, h)$ is bounded in $h^{M''} S_{\mathcal{T}}^{-M''}$ uniformly w.r.t. ζ_n in \mathbf{R} ; for the fourth term we use that for all $j, N \in \mathbf{N}$, $\partial_{z_n}^j \sigma_\infty(z, \zeta', h)$ is in $h^N S_{\mathcal{T}}^{-N}$ and $\langle \zeta_n \rangle^{M'} \partial_{z_n}^j \partial_{\zeta_n}^k \tilde{\Sigma}(z, \zeta, h)$ is bounded in $S_{\mathcal{T}}^{-N}$ uniformly w.r.t. ζ_n in \mathbf{R} , for all $M', N, j, k \in \mathbf{N}$. \blacksquare

Continuation of the proof of Proposition 2.9. With Lemma 2.10, we have $(\text{Id} - \text{Op}(\chi)) \circ \text{op}(\chi^+) \in \cap_{N \in \mathbf{N}} h^N \Psi^{-N}$. Noting that $\underline{u} = \text{op}(\chi^+) \underline{v}$, we obtain

$$(2.25) \quad \|g_1\|_2 \leq Ch^2 \|\underline{v}\|_0.$$

Next, we compute the action in the region $x_n > 0$ of the parametrix E_M on the terms defined on the interface in (2.24). We find

$$\begin{aligned} E_M \left(\frac{h}{i} w_0 \delta \right) (x_0, x) &= (2\pi h)^{-n} \iint e^{i((x_0 - z_0)\xi_0 + \langle x' - z', \xi' \rangle)/h} \hat{t}_0(x_0, x, \xi_0, \xi') w_0(z_0, z') d(z_0, z') d(\xi_0, \xi'), \\ E_M(-h^2 w_1 \delta') &= (2\pi h)^{-n} \iint e^{i((x_0 - z_0)\xi_0 + \langle x' - z', \xi' \rangle)/h} \hat{t}_1(x_0, x, \xi_0, \xi') w_1(z_0, z') d(z_0, z') d(\xi_0, \xi'), \end{aligned}$$

where

$$\hat{t}_0(x_0, x, \xi_0, \xi') = \frac{1}{2i\pi} \int_{\mathbf{R}} e^{ix_n \xi_n/h} e(x_0, x, \xi_0, \xi) d\xi_n, \quad \hat{t}_1(x_0, x, \xi_0, \xi') = \frac{1}{2i\pi} \int_{\mathbf{R}} e^{ix_n \xi_n/h} e(x_0, x, \xi_0, \xi) \xi_n d\xi_n.$$

Note that the integral defining \hat{t}_0 is absolutely converging. The integral defining \hat{t}_1 is however to be understood in the sense of oscillatory integrals [Hör90, Section 7.8]. Note that we have

$$(2.26) \quad \hat{t}_1(x_0, x, \xi_0, \xi') = \frac{1}{2i\pi} D_{z_n} \int_{\mathbf{R}} e^{iz_n \xi_n/h} e(x_0, x, \xi_0, \xi) d\xi_n \Big|_{z_n=x_n}.$$

The choice we have made for the cut-off function χ makes the symbol $e(x_0, x, \xi_0, \xi)$ holomorphic for large $|\xi_n|$, $\xi_n \in \mathbf{C}$. In $x_n > 0$, we thus obtain

$$(2.27) \quad \hat{t}_0(x_0, x, \xi_0, \xi') = \frac{1}{2i\pi} \int_{\gamma} e^{ix_n \xi_n/h} e(x_0, x, \xi_0, \xi) d\xi_n,$$

where γ is the union of the segment $\{\xi_n \in \mathbf{R}; |\xi_n| \leq C_0|(\xi_0, \xi')|\}$ and the half circle $\{\xi_n \in \mathbf{C}; |\xi_n| = C_0|(\xi_0, \xi')|, \text{Im } \xi_n > 0\}$, where the constant C_0 is chosen sufficiently large so as to have the roots $\rho^{\mathbb{M},+}$ inside the domain with boundary γ (recall that $\chi^+ \rho^{\mathbb{M},+}$ is in S^1). From (2.26), we obtain similarly

$$(2.28) \quad \hat{t}_1(x_0, x, \xi_0, \xi') = \frac{1}{2i\pi} \int_{\gamma} e^{ix_n \xi_n / h} e(x_0, x, \xi_0, \xi) \xi_n d\xi_n, \quad x_n > 0.$$

The expression (2.27) and (2.28) above are valid in $x_n > 0$ but admit a trace at $x_n = 0^+$. In particular, we note that we have

$$(2.29) \quad |D_{x_n}^l \partial_{(x_0, x')}^{\alpha} \partial_{(\xi_0, \xi')}^{\beta} \hat{t}_j| \leq C_{\alpha, \beta, l} \langle (\xi_0, \xi') \rangle^{-1+j+l-|\beta|}, \quad x_n \geq 0, \quad j = 0, 1, \quad l \in \mathbf{N}.$$

We now choose $\chi_1(x_0, x, \xi_0, \xi') \in S_{\mathcal{T}}^0$, satisfying the same requirement as χ^+ , equal to one in a neighborhood of $\text{supp}(\chi^+)$ and such that the symbol χ be equal to one in a neighborhood of $\text{supp}(\chi_1)$. We set $t_j = \chi_1 \hat{t}_j$, $j = 0, 1$ and $g_2 = \text{op}((1 - \chi_1) \hat{t}_0) w_0 + \text{op}((1 - \chi_1) \hat{t}_1) w_1$. This yields

$$(2.30) \quad \underline{u} = E_M \underline{g} + \text{op}(t_0) w_0 + \text{op}(t_1) w_1 + g_1 + g_2.$$

From the composition formula of tangential operators (1.3), noting that it does not involve derivations w.r.t. the variable x_n , and estimate (2.29), we obtain

$$(2.31) \quad \|g_2\|_2 \leq Ch^2(\|v\|_1 + |D_{x_n} v|_{x_n=0^+}|_0),$$

since $\text{supp}(1 - \chi_1) \cap \text{supp}(\chi^+) = \emptyset$, by making use of the following trace formula [LR97, page 486]

$$(2.32) \quad |\psi|_{x_n=0^+}|_j \leq Ch^{-\frac{1}{2}} \|\psi\|_{j+1}, \quad j \in \mathbf{N}.$$

We now observe that the symbols $e(x_0, x, \xi_0, \xi)$ is holomorphic w.r.t. ξ_n in the support of χ_1 . We can then write

$$(2.33) \quad t_j = \text{diag}(t_j^g, t_j^d), \quad t_j^{\mathbb{M}}(x_0, x, \xi_0, \xi') = \chi_1(x_0, x, \xi_0, \xi') \frac{1}{2i\pi} \int_{\gamma_0^{\mathbb{M}}} e^{ix_n \xi_n / h} e^{\mathbb{M}}(x_0, x, \xi_0, \xi) \xi_n^j d\xi_n, \quad j = 0, 1,$$

where $\gamma_0^{\mathbb{M}}$ is a direct contour surrounding the roots $\rho^{\mathbb{M},+}$ in the region $\text{Im } \xi_n \geq c_0|(\xi_0, \xi')|$, for $c_0 > 0$.

We note that in $\text{supp}(\chi_1)$ we have

$$e_0^{\mathbb{M}} = \frac{1}{p_{\varphi}^{\mathbb{M}}} = \frac{1}{\rho^{\mathbb{M},+} - \rho^{\mathbb{M},-}} \left(\frac{1}{\xi_n - \rho^{\mathbb{M},+}} - \frac{1}{\xi_n - \rho^{\mathbb{M},-}} \right).$$

The residue formula then yields

$$(2.34) \quad e^{-ix_n \rho^{\mathbb{M},+} / h} t_j^{\mathbb{M}} = \chi_1 \frac{(\rho^{\mathbb{M},+})^j}{\rho^{\mathbb{M},+} - \rho^{\mathbb{M},-}} + h \lambda^{\mathbb{M}}, \quad j = 0, 1, \quad \lambda^{\mathbb{M}} \in S_{\mathcal{T}}^{-2+j}.$$

It should be noted that it is crucial to have $\text{Im } \rho^{\mathbb{M},+} \geq C > 0$ and $\text{Im } \rho^{\mathbb{M},-} \leq -C < 0$ here. From (2.33) we obtain the estimate

$$|(D_{x_n})^l \partial_{(x_0, x')}^{\alpha} \partial_{(\xi_0, \xi')}^{\beta} t_j| \leq C_{\alpha, \beta, l} e^{-c_0(x_n/h) \langle (\xi_0, \xi') \rangle} \langle (\xi_0, \xi') \rangle^{-1+j-|\beta|+l}, \quad x_n \geq 0,$$

again by the residue formula, which yields $e^{c_0 x_n/h} (D_{x_n})' t_j$ bounded in $S_{\mathcal{T}}^{j-1+l}$ uniformly w.r.t. $x_n \geq 0$. It follows that

$$(2.35) \quad \|\Lambda^1 \circ \text{op}(t_j) w_j\|_0^2 = \int_{x_n > 0} e^{-2c_0 x_n/h} |\text{op}(e^{c_0 x_n/h} t_j) w_j|_1^2(x_n) dx_n \leq Ch |w_j|_j^2,$$

and

$$(2.36) \quad \|D_{x_n} \text{op}(t_j) w_j\|_0^2 = \int_{x_n > 0} e^{-2c_0 x_n/h} |\text{op}(e^{c_0 x_n/h} D_{x_n} t_j) w_j|_0^2(x_n) dx_n \leq Ch |w_j|_j^2.$$

From (2.30), and estimates (2.20), (2.25), (2.31), (2.35), (2.36) we obtain

$$(2.37) \quad \|u\|_1 \leq C \left(\|P_\varphi v\|_0 + h \|v\|_1 + h^{\frac{1}{2}} (|w_0|_0 + |w_1|_1) + h^2 |D_{x_n} v|_{x_n=0^+}|_0 \right).$$

We shall now address the boundary terms w_0 and w_1 . We take the trace at $x_n = 0^+$ of (2.30) which gives

$$(2.38) \quad \gamma_0(u) = \text{op}(a) \gamma_0(u) + \text{op}(b) \gamma_1(u) + G_2,$$

where $a \in S_{\mathcal{T}}^0$ and $b \in S_{\mathcal{T}}^{-1}$, with principal symbols

$$a_0 = \text{diag}(a_0^g, a_0^d), \quad \text{with} \quad a_0^g = - \left(\chi_1 \frac{\rho^{g_d, -}}{\rho^{g_d, +} - \rho^{g_d, -}} \right) \Big|_{x_n=0^+},$$

$$b_{-1} = \text{diag}(b_{-1}^g, b_{-1}^d), \quad \text{with} \quad b_{-1}^g = \left(\chi_1 \frac{1}{\rho^{g_d, +} - \rho^{g_d, -}} \right) \Big|_{x_n=0^+},$$

by (2.34) and (2.22). Note that the symbols a and b are *diagonal*. The function G_2 is given by $G_2 = (E_M \underline{g} + g_1 + g_2)|_{x_n=0^+}$. From the trace formula (2.32), we write

$$(2.39) \quad |G_2|_1 \leq Ch^{-\frac{1}{2}} \|E_M \underline{g} + g_1 + g_2\|_2 \leq Ch^{-\frac{1}{2}} \left(\|P_\varphi v\|_0 + h \|v\|_1 + h^2 |D_{x_n} v|_{x_n=0^+}|_0 \right),$$

since $E_M \in \Psi^{-2}$ and making use of estimates (2.20), (2.25) and (2.31).

The transmission conditions (TC_u) give

$$(2.40) \quad \gamma_0(u^g) = \gamma_0(u^d) + \theta_{\varphi, \chi^+}, \quad \gamma_1(u^g) = -\beta \gamma_1(u^d) + k \gamma_0(u^d) + \tilde{G}_1$$

where $\beta = (c^d/c^g)|_{x_n=0^+}$, $k = -i(\partial_{x_n} \varphi^g|_{x_n=0^+} + \beta \partial_{x_n} \varphi^d|_{x_n=0^+})$ and $\tilde{G}_1 = -i \partial_{x_n} \varphi^g \theta_{\varphi, \chi^+} + \frac{1}{c^g|_{x_n=0^+}} G_1$ with

$$(2.41) \quad |\tilde{G}_1|_0 \leq Ch |v|_{x_n=0^+}|_0 + C(|\theta_\varphi|_0 + |\Theta_\varphi|_0),$$

by (2.21). From (2.38) we thus obtain

$$(\text{Id} - \text{op}(a)) \begin{pmatrix} \gamma_0(u^d) + \theta_{\varphi, \chi^+} \\ \gamma_0(u^d) \end{pmatrix} = \text{op}(b) \begin{pmatrix} -\beta \gamma_1(u^d) + k \gamma_0(u^d) + \tilde{G}_1 \\ \gamma_1(u^d) \end{pmatrix} + G_2.$$

We thus have

$$\begin{pmatrix} \text{Id} - \text{op}(a^g) - \text{op}(b^g) \circ k & \text{op}(b^g) \circ \beta \\ \text{Id} - \text{op}(a^d) & -\text{op}(b^d) \end{pmatrix} \begin{pmatrix} \gamma_0(u^d) \\ \gamma_1(u^d) \end{pmatrix} = G_2 + \begin{pmatrix} \text{op}(a^g) - \text{Id} \\ 0 \end{pmatrix} \theta_{\varphi, \chi^+} + \begin{pmatrix} \text{op}(b^g) \\ 0 \end{pmatrix} \tilde{G}_1$$

where β and k stand here for the associated multiplication operators. We thus obtain a system of the form

$$(2.42) \quad \text{op}(\kappa) \begin{pmatrix} \gamma_0(u^d) \\ \Lambda^{-1} \gamma_1(u^d) \end{pmatrix} = G_2 + \text{op}(\pi) \theta_{\varphi, \chi^+} + \text{op}(\Pi) \tilde{G}_1,$$

where κ is a 2×2 matrix with entries in $S_{\mathcal{T}}^0$, with principal symbol

$$\kappa_0 = \begin{pmatrix} 1 - a_0^g - kb_{-1}^g & \beta \langle (\xi_0, \xi') \rangle b_{-1}^g \\ 1 - a_0^d & -\langle (\xi_0, \xi') \rangle b_{-1}^d \end{pmatrix},$$

and π and Π are 2×1 matrices with entries in $S_{\mathcal{T}}^0$ and $S_{\mathcal{T}}^{-1}$ respectively, with principal symbols

$$\pi_0 = \begin{pmatrix} a_0^g - 1 \\ 0 \end{pmatrix} \quad \text{and} \quad \Pi_{-1} = \begin{pmatrix} b_{-1}^g \\ 0 \end{pmatrix}.$$

We now choose $\chi_2(x_0, x, \xi_0, \xi') \in S_{\mathcal{T}}^0$, satisfying the same requirement as χ^+ , equal to one in a neighborhood of $\text{supp}(\chi^+)$ and such that the symbol χ_1 be equal to one in a neighborhood of $\text{supp}(\chi_2)$. In $\text{supp}(\chi_2)$, we obtain

$$\kappa_0|_{\text{supp}(\chi_2)} = \begin{pmatrix} \frac{\rho^{g,+} - k}{\rho^{g,+} - \rho^{g,-}} & \beta \langle (\xi_0, \xi') \rangle \frac{1}{\rho^{g,+} - \rho^{g,-}} \\ \frac{\rho^{d,+}}{\rho^{d,+} - \rho^{d,-}} & -\langle (\xi_0, \xi') \rangle \frac{1}{\rho^{d,+} - \rho^{d,-}} \end{pmatrix} \Big|_{x_n=0^+}.$$

This yields

$$\det(\kappa_0)|_{\text{supp}(\chi_2)} = - \frac{\langle (\xi_0, \xi') \rangle (\rho^{g,+} + \beta \rho^{d,+} - k)}{(\rho^{g,+} - \rho^{g,-})(\rho^{d,+} - \rho^{d,-})} \Big|_{x_n=0^+}.$$

Since we have $\text{Im}(\rho^{g,+} + \beta \rho^{d,+}) \geq C \langle (\xi_0, \xi') \rangle > 0$ in $\text{supp}(\chi_2)$, and since

$$\text{Im}(-k) = \frac{1}{c^g|_{x_n=0^+}} (c^g \partial_{x_n} \varphi^g + c^d \partial_{x_n} \varphi^d)|_{x_n=0^+} \geq 0,$$

by (2.10), we find that $|\det(\kappa_0)|_{\text{supp}(\chi_2)}| \geq C > 0$. It follows that κ is elliptic in $\text{supp}(\chi_2)$. Then, there exists $l_M \in S_{\mathcal{T}}^0$, such that

$$\text{op}(l_M) \circ \text{op}(\kappa) = \text{op}(\chi_2) + h^{M+1} \tilde{R}_M,$$

with $\tilde{R}_M \in \Psi_{\mathcal{T}}^{-1-M}$, for $M \in \mathbb{N}$ large. This yields

$$\begin{pmatrix} \gamma_0(u^d) \\ \Lambda^{-1} \gamma_1(u^d) \end{pmatrix} = \text{op}(l_M) G_2 + \text{op}(l_M) \circ \text{op}(\pi) \theta_{\varphi, \chi^+} + \text{op}(l_M) \circ \text{op}(\Pi) \tilde{G}_1 + (\text{op}(1 - \chi_2) - h^M \tilde{R}_M) \begin{pmatrix} \gamma_0(u^d) \\ \Lambda^{-1} \gamma_1(u^d) \end{pmatrix}.$$

From the ψ DO calculus, since $\text{supp}(1 - \chi_2) \cap \text{supp}(\chi^+) = \emptyset$, and making use of the trace formula (2.32) we obtain

$$(2.43) \quad \begin{aligned} |\gamma_0(u^d)|_1 + |\gamma_1(u^d)|_0 &\leq C \left(|G_2|_1 + |\theta_{\varphi, \chi^+}|_1 + |\tilde{G}_1|_0 + h^2 \|v\|_1 + h^2 |D_{x_n} v|_{x_n=0^+}|_0 \right) \\ &\leq C' \left(h^{-\frac{1}{2}} \|P_{\varphi} v\|_0 + h^{\frac{1}{2}} \|v\|_1 + h^{\frac{3}{2}} |D_{x_n} v|_{x_n=0^+}|_0 + |\theta_{\varphi}|_1 + |\Theta_{\varphi}|_0 \right), \end{aligned}$$

by (2.41) and (2.39). From (2.40), the same estimate holds for $|\gamma_0(u^g)|_1 + |\gamma_1(u^g)|_0$, and also for $|w_0|_0 + |w_1|_1$ by (2.22):

$$(2.44) \quad h^{\frac{1}{2}} (|w_0|_0 + |w_1|_1) \leq C \left(\|P_{\varphi} v\|_0 + h \|v\|_1 + h^2 |D_{x_n} v|_{x_n=0^+}|_0 + h^{\frac{1}{2}} |\theta_{\varphi}|_1 + h^{\frac{1}{2}} |\Theta_{\varphi}|_0 \right).$$

Observing that

$$D_{x_n} \text{op}(\chi^+ v) = \text{op}(\chi^+) D_{x_n} v + \underbrace{[D_{x_n}, \text{op}(\chi^+)]}_{\in h \Psi_{\mathcal{T}}^0} v,$$

we have

$$(2.45) \quad h^{\frac{1}{2}} \left(|\operatorname{op}(\chi^+)v|_{x_n=0^+}|_1 + |\operatorname{op}(\chi^+)D_{x_n}v|_{x_n=0^+}|_0 \right) \leq Ch^{\frac{1}{2}} \left(|u|_{x_n=0^+}|_1 + |D_{x_n}u|_{x_n=0^+}|_0 + h|v|_{x_n=0^+}|_0 \right) \\ \leq C \left(\|P_\varphi v\|_0 + h\|v\|_1 + h^2|D_{x_n}v|_{x_n=0^+}|_0 + h^{\frac{1}{2}}|\theta_\varphi|_1 + h^{\frac{1}{2}}|\Theta_\varphi|_0 \right),$$

from the previous inequalities and the trace formula (2.32). We conclude the proof by combining estimates (2.37), (2.44) and (2.45). \blacksquare

2.4. Estimate in the region $\mathcal{E}^{d,-}$. With a microlocal cut-off, we place ourselves in the region $\mathcal{E}^{d,-}$, finitely away from \mathcal{J}^d . Making use of the standard techniques to prove Carleman estimates for both P_φ^s and P_φ^d , we obtain the following partial Carleman estimate.

Proposition 2.11. *Let K be a compact subset of V . Let $\chi^-(x_0, x, \xi_0, \xi') \in S_{\mathcal{T}}^0$ with a compact support w.r.t. (x_0, x) contained in V , be such that in the support of χ^- we have $\mu^d(x_0, x, \xi_0, \xi') \leq -C < 0$. With the weight function φ satisfying Assumption 2.1, there exist $C > 0$ and $h_1 > 0$ such that*

$$(2.46) \quad h\|\operatorname{op}(\chi^-)v\|_1^2 + h\|\operatorname{op}(\chi^-)v|_{x_n=0^+}\|_1^2 + h\|\operatorname{op}(\chi^-)D_{x_n}v|_{x_n=0^+}\|_0^2 \leq C \left(\|P_\varphi v\|_0^2 + h^2\|v\|_1^2 + h|\theta_\varphi|_1^2 + h|\Theta_\varphi|_0^2 \right),$$

for $0 < h \leq h_1$, and for $v = {}^t(v^s, v^d)$, $v^d, v^s \in \mathcal{C}_c^\infty(K^d)$ and satisfying (TC_φ) .

Proof. We set $u = \operatorname{op}(\chi^-)v$. Then, $P_\varphi u = g$ with $g = \operatorname{op}(\chi^-)P_\varphi v + [P_\varphi, \operatorname{op}(\chi^-)]v$. In particular, we have

$$(2.47) \quad \|g\|_0 \leq C \left(\|P_\varphi v\|_0 + h\|v\|_1 \right).$$

The transmission conditions satisfied by u^d and u^s are (TC_u) –see the proof of Proposition 2.9– with $\theta_{\varphi, \chi^-} := \operatorname{op}(\chi^-)\theta_\varphi|_{x_n=0^+}$ in place of θ_{φ, χ^+} and with G_1 here given by

$$G_1 = [c^s(D_{x_n} + i\partial_{x_n}\varphi^s), \operatorname{op}(\chi^-)]v^s|_{x_n=0^+} + [c^d(D_{x_n} + i\partial_{x_n}\varphi^d), \operatorname{op}(\chi^-)]v^d|_{x_n=0^+} + \operatorname{op}(\chi^-)\Theta_\varphi|_{x_n=0^+},$$

and satisfying

$$(2.48) \quad |G_1|_0 \leq Ch|v|_{x_n=0^+}|_0 + C|\Theta_\varphi|_0.$$

We apply the Carleman method to the operators P_φ^s and P_φ^d . By Assumption 2.1, and in particular by (2.3), and by Lemma 2 in [LR95], we then have

$$(2.49) \quad h\|u^{\mathcal{J}_d}\|_1^2 + \operatorname{Re} \left(h\mathcal{B}^{\mathcal{J}_d}(u^{\mathcal{J}_d}) + h^2 \left((D_n u^{\mathcal{J}_d} + L_1^{\mathcal{J}_d} u^{\mathcal{J}_d})|_{x_n=0^+}, L_0^{\mathcal{J}_d} u^{\mathcal{J}_d}|_{x_n=0^+} \right)_0 \right) \leq C\|g^{\mathcal{J}_d}\|_0^2,$$

for h sufficiently small, where $L_1^{\mathcal{J}_d} \in \mathcal{D}_{\mathcal{T}}^1$, $L_0^{\mathcal{J}_d} \in \Psi_{\mathcal{T}}^0$. The quadratic forms $\mathcal{B}^{\mathcal{J}_d}$ are given by

$$(2.50) \quad \mathcal{B}^{\mathcal{J}_d}(\psi) = \underbrace{\begin{pmatrix} 2\partial_{x_n}\varphi^{\mathcal{J}_d} & B_1^{\mathcal{J}_d}\Lambda^{-1} \\ \Lambda^{-1}B_1^{\mathcal{J}_d'} & \Lambda^{-1}B_2^{\mathcal{J}_d}\Lambda^{-1} \end{pmatrix}}_{B^{\mathcal{J}_d} \in \Psi_{\mathcal{T}}^0} \begin{pmatrix} \gamma_1(\psi) \\ \Lambda^1\gamma_0(\psi) \end{pmatrix}, \begin{pmatrix} \gamma_1(\psi) \\ \Lambda^1\gamma_0(\psi) \end{pmatrix}_0, \quad \gamma_0(\psi) = \psi|_{x_n=0^+}, \gamma_1(\psi) = D_{x_n}\psi|_{x_n=0^+},$$

where $B_1^{\mathcal{J}_d}, B_1^{\mathcal{J}_d'} \in \mathcal{D}_{\mathcal{T}}^1$, with $\sigma(B_1^{\mathcal{J}_d}) = \sigma(B_1^{\mathcal{J}_d'}) = 2q_1^{\mathcal{J}_d}$ and $B_2^{\mathcal{J}_d} \in \mathcal{D}_{\mathcal{T}}^2$, with $\sigma(B_2^{\mathcal{J}_d}) = -2\partial_{x_n}\varphi^{\mathcal{J}_d}q_2^{\mathcal{J}_d}$. Observe that we have

$$(2.51) \quad h^2 \left| \left((D_n u^{\mathcal{J}_d} + L_1^{\mathcal{J}_d} u^{\mathcal{J}_d})|_{x_n=0^+}, L_0^{\mathcal{J}_d} u^{\mathcal{J}_d}|_{x_n=0^+} \right)_0 \right| \leq Ch^2 \left(|\gamma_1(u^{\mathcal{J}_d})|_0^2 + |\gamma_0(u^{\mathcal{J}_d})|_1^2 \right).$$

The tangential ψ DOs B^{\sharp_d} defined in (2.50) are of order 0 and their principal symbols are

$$\sigma(B^{\sharp_d}) = \begin{pmatrix} 2\partial_{x_n}\varphi^{\sharp_d} & 2q_1^{\sharp_d}\langle(\xi_0, \xi')\rangle^{-1} \\ 2q_1^{\sharp_d}\langle(\xi_0, \xi')\rangle^{-1} & -2\partial_{x_n}\varphi^{\sharp_d}q_2^{\sharp_d}\langle(\xi_0, \xi')\rangle^{-2} \end{pmatrix}.$$

We find $\det(\sigma(B^{\sharp_d})) = -4(\partial_{x_n}\varphi^{\sharp_d})^2\langle(\xi_0, \xi')\rangle^{-2}\mu^{\sharp_d}$, with μ^{\sharp_d} as defined in Section 2.2; it follows that in $\text{supp}(\chi^-)$ we have $\det(\sigma(B^d)) \geq C > 0$. Since $\partial_{x_n}\varphi^d > 0$ it follows that $\sigma(B^d)$ is positive definite.

We now make use of transmission conditions (TC_u) and write

$$(2.52) \quad \begin{pmatrix} \gamma_1(u^g) \\ \Lambda^1\gamma_0(u^g) \end{pmatrix} = \underbrace{\begin{pmatrix} -\beta & k\Lambda^{-1} \\ 0 & 1 \end{pmatrix}}_{C^g} \begin{pmatrix} \gamma_1(u^d) \\ \Lambda^1\gamma_0(u^d) \end{pmatrix} + \begin{pmatrix} \tilde{G}_1 \\ \Lambda^1\theta_{\varphi,\chi^-} \end{pmatrix},$$

where $\beta = (c^d/c^g)|_{x_n=0^+}$, $k = -i(\partial_{x_n}\varphi^g|_{x_n=0^+} + \beta\partial_{x_n}\varphi^d|_{x_n=0^+})$ and $\tilde{G}_1 = -i\partial_{x_n}\varphi^g\theta_{\varphi,\chi^-} + \frac{1}{c^g|_{x_n=0^+}}G_1$ that satisfies

$$(2.53) \quad |\tilde{G}_1|_0 \leq Ch^{\frac{1}{2}}\|v\|_1 + C(|\theta_\varphi|_0 + |\Theta_\varphi|_0),$$

by (2.48) and trace formula (2.32). We obtain

$$\mathcal{B}^g(u^g) = \left(\tilde{B}^g \begin{pmatrix} \gamma_1(u^d) \\ \Lambda^1\gamma_0(u^d) \end{pmatrix}, \begin{pmatrix} \gamma_1(u^d) \\ \Lambda^1\gamma_0(u^d) \end{pmatrix} \right)_0 + U(\gamma_1(u^d), \gamma_0(u^d), \theta_{\varphi,\chi^-}, \tilde{G}_1),$$

where $\sigma(\tilde{B}^g) = {}^t\overline{\sigma(C^g)}\sigma(B^g)\sigma(C^g) \in S_{\mathcal{T}}^1$, which gives

$$(2.54) \quad \left| \left(\tilde{B}^g \begin{pmatrix} \gamma_1(u^d) \\ \Lambda^1\gamma_0(u^d) \end{pmatrix}, \begin{pmatrix} \gamma_1(u^d) \\ \Lambda^1\gamma_0(u^d) \end{pmatrix} \right)_0 \right| \leq C \left(|\gamma_0(u^d)|_1^2 + |\gamma_1(u^d)|_0^2 \right),$$

and where we have

$$\begin{aligned} U(\gamma_1(u^d), \gamma_0(u^d), \theta_{\varphi,\chi^-}, \tilde{G}_1) &= \left(B^g C^g \begin{pmatrix} \gamma_1(u^d) \\ \Lambda^1\gamma_0(u^d) \end{pmatrix}, \begin{pmatrix} \tilde{G}_1 \\ \Lambda^1\theta_{\varphi,\chi^-} \end{pmatrix} \right)_0 + \left(B^g \begin{pmatrix} \tilde{G}_1 \\ \Lambda^1\theta_{\varphi,\chi^-} \end{pmatrix}, C^g \begin{pmatrix} \gamma_1(u^d) \\ \Lambda^1\gamma_0(u^d) \end{pmatrix} \right)_0 \\ &\quad + \left(B^g \begin{pmatrix} \tilde{G}_1 \\ \Lambda^1\theta_{\varphi,\chi^-} \end{pmatrix}, \begin{pmatrix} \tilde{G}_1 \\ \Lambda^1\theta_{\varphi,\chi^-} \end{pmatrix} \right)_0, \end{aligned}$$

which from (2.53) satisfies

$$(2.55) \quad |U(\gamma_1(u^d), \gamma_0(u^d), \theta_{\varphi,\chi^-}, \tilde{G}_1)| \leq C \left(|\gamma_0(u^d)|_1^2 + |\gamma_1(u^d)|_0^2 + h\|v\|_1^2 + |\theta_\varphi|_1^2 + |\Theta_\varphi|_0^2 \right).$$

For any $K > 0$, with $\alpha > 0$ sufficiently large, we can enforce $\alpha\sigma(B^d) + \sigma(\tilde{B}^g) \geq K > 0$. Hence, with (2.54), (2.55) and Gårding's inequality [Tay81, Mar02] we obtain

$$(2.56) \quad \alpha \text{Re } \mathcal{B}^d(u^d) + \text{Re } \mathcal{B}^g(u^g) \geq \frac{K}{2} \left(|\gamma_0(u^d)|_1^2 + |\gamma_1(u^d)|_0^2 \right) - \left(h\|v\|_1^2 + |\theta_\varphi|_1^2 + |\Theta_\varphi|_0^2 \right),$$

for K sufficiently large and for h sufficiently small. The transmission conditions (2.52) give

$$(2.57) \quad |\gamma_0(u^g)|_1^2 + |\gamma_1(u^g)|_0^2 \leq C \left(|\gamma_0(u^d)|_1^2 + |\gamma_1(u^d)|_0^2 + |\theta_\varphi|_1^2 + |\Theta_\varphi|_0^2 + h\|v\|_1^2 \right).$$

Recalling that

$$D_{x_n} \text{op}(\chi^- v) = \text{op}(\chi^-) D_{x_n} v + \underbrace{[D_{x_n}, \text{op}(\chi^-)] v}_{\in h\Psi_{\mathcal{T}}^0},$$

with the linear combination $\alpha(2.49)^d + (2.49)^g$ and estimates (2.47), (2.51), (2.56) and (2.57) we obtain the sought partial Carleman estimate, by choosing ε and h sufficiently small. \blacksquare

Remark 2.12. As an alternative proof of Proposition 2.11, we could also use the Calderón projector technique for P_φ^d . In $\text{supp}(\chi^-)$ the two roots $\rho^{d,\pm}$ of p_φ^d have negative imaginary part. With the notation and the argumentation of the proof of Proposition 2.9 above, the operators t_0^d and t_1^d vanish in $x_n > 0$. The counterpart of (2.30) is then

$$(2.58) \quad u^d = E_M \underline{g}^d + g_1^d + g_2^d, \quad \text{for } x_n > 0.$$

We then obtain (see (2.37))

$$(2.59) \quad \|u^d\|_1 \leq C \left(\|P_\varphi^d v^d\|_0 + h\|v^d\|_1 + h^2 |D_{x_n} v^d|_{x_n=0^+}|_0 \right).$$

We take the trace at $x_n = 0^+$ of (2.58),

$$\gamma_0(u^d) = G_2^d = (E_M \underline{g}^d + g_1^d + g_2^d)|_{x_n=0^+},$$

which, by the counterpart of (2.39), gives

$$(2.60) \quad h^{\frac{1}{2}} |\gamma_0(u^d)|_1 \leq C \left(\|P_\varphi v\|_0 + h\|v\|_1 + h^2 |D_{x_n} v|_{x_n=0^+}|_0 \right).$$

From (2.58) we also have

$$D_{x_n} u^d = D_{x_n} E_M \underline{g}^d + D_{x_n} g_1^d + D_{x_n} g_2^d, \quad \text{for } x_n > 0.$$

We take the trace at $x_n = 0^+$ and obtain

$$\gamma_1(u^d) = (D_{x_n} (E_M \underline{g}^d + g_1^d + g_2^d))|_{x_n=0^+}.$$

From the trace formula (2.32) we then have

$$|\gamma_1(u^d)|_0 \leq C h^{-\frac{1}{2}} \|D_{x_n} (E_M \underline{g}^d + g_1^d + g_2^d)\|_1 \leq C h^{-\frac{1}{2}} \|E_M \underline{g}^d + g_1^d + g_2^d\|_2$$

and, by the counterpart of (2.39), this yields

$$(2.61) \quad h^{\frac{1}{2}} |\gamma_1(u^d)|_0 \leq C \left(\|P_\varphi v\|_0 + h\|v\|_1 + h^2 |D_{x_n} v|_{x_n=0^+}|_0 \right).$$

From (2.60) and (2.61) and transmission condition (TC_u), we obtain

$$(2.62) \quad h^{\frac{1}{2}} |\gamma_0(u^g)|_1 + h^{\frac{1}{2}} |\gamma_1(u^g)|_0 \leq C \left(\|P_\varphi v\|_0 + h\|v\|_1 + h^2 |D_{x_n} v|_{x_n=0^+}|_0 + h^{\frac{1}{2}} |\theta_{\varphi, \chi^-}|_1 + h^{\frac{1}{2}} |\Theta_\varphi|_0 \right).$$

Finally with (2.59), (2.62), (2.51)^g, and (2.49)^g we can also achieve the result of Proposition 2.11.

2.5. Estimate around the region \mathcal{J}^d . With a microlocal cut-off, we place ourselves in a neighborhood of the region \mathcal{J}^d , i.e., where $|\mu^d|$ is small, while staying in the region $\mathcal{E}^{g,+}$ away from the region \mathcal{J}^g . Making use of the techniques of Calderón projectors for P_φ^g and standard techniques to prove Carleman estimates for P_φ^d , we obtain the following partial Carleman estimate.

Proposition 2.13. *Let K be a compact subset of V . Let φ satisfy Assumption 2.1. Let $\chi^0(x_0, x, \xi_0, \xi') \in S_{\mathcal{T}}^0$ with a compact support w.r.t. (x_0, x) contained in V and be such that in the support of χ^0 we have $\mu^g(x_0, x, \xi_0, \xi') \geq C > 0$ and*

$$(2.63) \quad (c^g \partial_{x_n} \varphi^g + c^d \partial_{x_n} \varphi^d)^2|_{x_n=0^+} - (c^d)^2 \mu^d|_{x_n=0^+} \geq C' > 0, \quad \text{in } \text{supp}(\chi^0).$$

Then, there exist $C > 0$ and $h_1 > 0$ such that

$$(2.64) \quad h \|\text{op}(\chi^0)v\|_1^2 + h \|\text{op}(\chi^0)v|_{x_n=0^+}\|_1^2 + h \|\text{op}(\chi^0)D_{x_n}v|_{x_n=0^+}\|_0^2 \\ \leq C \left(\|P_\varphi v\|_0^2 + h^2 \|v\|_1^2 + h^4 |D_{x_n}v|_{x_n=0^+}|_0^2 + h|\theta_\varphi|_1^2 + h|\Theta_\varphi|_0^2 \right),$$

for $0 < h \leq h_1$, and for $v = {}^t(v^g, v^d)$, $v^d, v^g \in \mathcal{C}_c^\infty(K^d)$ and satisfying (TC_φ) .

Proof. Condition (2.63) can be obtained from the properties of the weight function φ listed in Assumption 2.1. In $\text{supp}(\chi^0)$, we have

$$\text{Im} \rho^{g,+} \geq C > 0, \quad \text{Im} \rho^{g,-} \leq -C < 0.$$

We set $u = \text{op}(\chi^0)v$. Then, $P_\varphi u = g$ with $g = \text{op}(\chi^0)P_\varphi v + [P_\varphi, \text{op}(\chi^0)]v$. In particular, we have

$$(2.65) \quad \|g^g\|_0 \leq C \left(\|P_\varphi^g v^g\|_0 + h \|v^g\|_1 \right).$$

The transmission conditions satisfied by u^d and u^g are (TC_u) —see the proof of Proposition 2.9— with $\theta_{\varphi, \chi^0} := \text{op}(\chi^0)\theta_\varphi|_{x_n=0^+}$ in place of θ_{φ, χ^+} with G_1 given here by

$$G_1 = [c^g(D_{x_n} + i\partial_{x_n}\varphi^g), \text{op}(\chi^0)]v^g|_{x_n=0^+} + [c^d(D_{x_n} + i\partial_{x_n}\varphi^d), \text{op}(\chi^0)]v^d|_{x_n=0^+} + \text{op}(\chi^0)\Theta_\varphi|_{x_n=0^+},$$

and satisfying

$$(2.66) \quad |G_1|_0 \leq Ch|v|_{x_n=0^+}|_0 + C|\Theta_\varphi|_0.$$

We start by applying the method of Calderón projectors to the operator P_φ^g and to u^g . We follow the same notation as in the proof of Proposition 2.9. We thus obtain an estimate of the form of (2.37), namely,

$$(2.67) \quad \|u^g\|_1 \leq C \left(\|P_\varphi^g v^g\|_0 + h \|v^g\|_1 + h^{\frac{1}{2}} (|\gamma_1(u^g)|_0 + |\gamma_0(u^g)|_1) + h^2 |D_{x_n} v^g|_{x_n=0^+}|_0 \right),$$

where $\gamma_0(u^g) = u^g|_{x_n=0^+}$ and $\gamma_1(u^g) = D_{x_n} u^g|_{x_n=0^+}$. We also have the following trace equation, of the same form as (2.38),

$$(2.68) \quad \gamma_0(u^g) = \text{op}(a^g)\gamma_0(u^g) + \text{op}(b^g)\gamma_1(u^g) + G_2^g,$$

with $a^g \in S_{\mathcal{T}}^0$ and $b^g \in S_{\mathcal{T}}^{-1}$, with principal symbols

$$a_0^g = - \left(\chi_1 \frac{\rho^{g,-}}{\rho^{g,+} - \rho^{g,-}} \right) \Big|_{x_n=0^+}, \quad b_{-1}^g = \left(\chi_1 \frac{1}{\rho^{g,+} - \rho^{g,-}} \right) \Big|_{x_n=0^+},$$

where $\chi_1(x_0, x, \xi_0, \xi') \in S_{\mathcal{T}}^0$, satisfies the same requirement as χ^0 , and is equal to one in a neighborhood of $\text{supp}(\chi^0)$. The function G_2^g satisfies

$$(2.69) \quad |G_2^g|_1 \leq Ch^{-\frac{1}{2}} \left(\|P_\varphi^g v^g\|_0 + h \|v^g\|_1 + h^2 |D_{x_n} v^g|_{x_n=0^+}|_0 \right).$$

We now use relation (2.68) in connection the transmission conditions (TC_u) . With (TC_u) , we write

$$\text{op}(b^g)\gamma_1(u^g) = -\text{op}(b^g)(\beta \gamma_1(u^d)) + \text{op}(b^g)(k \gamma_0(u^d)) + \text{op}(b^g)\tilde{G}_1, \quad \gamma_0(u^g) = \gamma_0(u^d) + \theta_{\varphi, \chi^0},$$

where $\beta = (c^d/c^g)|_{x_n=0^+}$, $k = -i(\partial_{x_n}\varphi^g|_{x_n=0^+} + \beta \partial_{x_n}\varphi^d|_{x_n=0^+})$ and $\tilde{G}_1 = -i\partial_{x_n}\varphi^g\theta_{\varphi, \chi^0} + \frac{1}{c^g|_{x_n=0^+}} G_1$ that satisfies

$$(2.70) \quad |\tilde{G}_1|_0 \leq Ch|v|_{x_n=0^+}|_0 + C(|\theta_\varphi|_0 + |\Theta_\varphi|_0),$$

by (2.66). From (2.68), we obtain

$$\underbrace{(\text{Id} - \text{op}(a^g) - \text{op}(b^g) \circ k)}_{:= \text{op}(\kappa)} \gamma_0(u^d) = -\text{op}(b^g)(\beta \gamma_1(u^d)) + \text{op}(b^g)\tilde{G}_1 + (\text{op}(a^g) - \text{Id})\theta_{\varphi, \chi^0} + G_2^g,$$

where k stands here for the associated multiplication operator.

Let $\chi_2(x_0, x, \xi_0, \xi') \in S_{\mathcal{T}}^0$ satisfy the same requirement as χ^0 , and be equal to one in a neighborhood of $\text{supp}(\chi^0)$ and be such that the symbol χ_1 is equal to one in a neighborhood of $\text{supp}(\chi_2)$. In $\text{supp}(\chi_2)$, the principal symbol of κ is given by

$$\kappa_0|_{\text{supp}(\chi_2)} = \frac{\rho^{g,+} - k}{\rho^{g,+} - \rho^{g,-}} \in S_{\mathcal{T}}^0.$$

In $\text{supp}(\chi_2)$ we have $\text{Im} \rho^{g,+} \geq C > 0$ and $\text{Im}(-k) \geq 0$ by Assumption 2.1, we see that κ is elliptic in $\text{supp}(\chi_2)$. Hence, there exists $l \in S_{\mathcal{T}}^0$, with $l = \sum_{j=0}^M h^j l_j$, with $l_j \in S_{\mathcal{T}}^{-j}$ and $l_0 = \chi_2/\kappa_0$, such that

$$\text{op}(l_M) \circ \text{op}(\kappa) = \text{op}(\chi_2) + h^{M+1} R_M,$$

with $R_M \in \Psi_{\mathcal{T}}^{-1-M}$, for M large. We thus obtain

$$(2.71) \quad \gamma_0(u^d) = -\text{op}(l) \circ \text{op}(b^g)(\beta \gamma_1(u^d)) + G_3,$$

with

$$G_3 = \text{op}(l) \circ \text{op}(b^g) \tilde{G}_1 + \text{op}(l) \circ (\text{op}(a^g) - \text{Id}) \theta_{\varphi, \chi^0} + \text{op}(l) G_2^g + (\text{Id} - \text{op}(\chi_2)) \gamma_0(u^d) - h^{M+1} R_M \gamma_0(u^d).$$

From the ψ DO calculus, since $\text{supp}(1 - \chi_2) \cap \text{supp}(\chi^0) = \emptyset$, we obtain

$$(2.72) \quad |G_3|_1 \leq C \left(h^{-\frac{1}{2}} \|P_{\varphi}^g v^g\|_0 + h^{\frac{1}{2}} \|v\|_1 + h^{\frac{3}{2}} |D_{x_n} v^g|_{x_n=0^+}|_0 + |\theta_{\varphi, \chi^0}|_1 + |\Theta_{\varphi}|_0 \right),$$

by (2.70) and (2.69) and making use of the trace formula (2.32). We thus have

$$(2.73) \quad |\gamma_0(u^d)|_1 \leq C \left(|\gamma_1(u^d)|_0 + h^{-\frac{1}{2}} \|P_{\varphi}^g v^g\|_0 + h^{\frac{1}{2}} \|v\|_1 + h^{\frac{3}{2}} |D_{x_n} v^g|_{x_n=0^+}|_0 + |\theta_{\varphi, \chi^0}|_1 + |\Theta_{\varphi}|_0 \right).$$

We now apply the Carleman method to the operator P_{φ}^d and to u^d . By Assumption 2.1, and in particular by (2.3), and by Lemma 2 in [LR95] we have

$$(2.74) \quad h \|u^d\|_1^2 + \text{Re} \left(h \mathcal{B}^d(u^d) + h^2 \left((D_n u^d + L_1^d u^d)|_{x_n=0^+}, L_0^d u^d|_{x_n=0^+} \right)_0 \right) \leq C \|P_{\varphi}^d u^d\|_0^2,$$

for h sufficiently small, where L_1^d , L_0^d , and \mathcal{B}^d are as given in the proof of Proposition 2.11. For any $\varepsilon > 0$ we have

$$(2.75) \quad h^2 \left| (D_n u^d + L_1^d u^d, L_0^d u^d)_0 \right| \leq h^2 \left(|\gamma_0(u^d)|_1^2 + |\gamma_1(u^d)|_0^2 \right).$$

With (2.71) we obtain

$$\mathcal{B}^d(u^d) = \left(M^* \circ B^d \circ M \gamma_1(u^d), \gamma_1(u^d) \right)_0 + U(\gamma_1(u^d), G_3),$$

with

$$M = \begin{pmatrix} 1 \\ -\Lambda^1 \circ \text{op}(l) \circ \text{op}(b^g) \circ \beta \end{pmatrix} \in \Psi_{\mathcal{T}}^0,$$

with β standing here for the associated multiplication operator, and where

$$U(\gamma_1(u^d), G_3) = \left(B^d \circ M \gamma_1(u^d), \begin{pmatrix} 0 \\ \Lambda^1 G_3 \end{pmatrix} \right)_0 + \left(B^d \begin{pmatrix} 0 \\ \Lambda^1 G_3 \end{pmatrix}, M \gamma_1(u^d) \right)_0 + \left(B^d \begin{pmatrix} 0 \\ \Lambda^1 G_3 \end{pmatrix}, \begin{pmatrix} 0 \\ \Lambda^1 G_3 \end{pmatrix} \right)_0.$$

With Young's inequality we obtain

$$(2.76) \quad |U(\gamma_1(u^d), G_3)| \leq C \left(|\gamma_1(u^d)|_0 |G_3|_1 + |G_3|_1^2 \right) \\ \leq \varepsilon |\gamma_1(u^d)|_0^2 + C_\varepsilon \left(h^{-1} \|P_\varphi^g v^g\|_0^2 + h \|v\|_1^2 + h^3 |D_{x_n} v^g|_{x_n=0^+}|_0^2 + |\theta_{\varphi, \chi^0}|_1^2 + |\Theta_\varphi|_0^2 \right),$$

by (2.72).

In $\text{supp}(\chi^0)$, the principal symbol of $M^* \circ B^d \circ M$ is in $S_{\mathcal{T}}^0$ and given by

$$\Sigma = \sigma(M^* \circ B^d \circ M) \\ = \overline{\begin{pmatrix} 1 \\ -\langle(\xi_0, \xi')\rangle^1 l_0 b_{-1}^g \beta \end{pmatrix}} \begin{pmatrix} 2\partial_{x_n} \varphi^d & 2q_1^d \langle(\xi_0, \xi')\rangle^{-1} \\ 2q_1^d \langle(\xi_0, \xi')\rangle^{-1} & -2\partial_{x_n} \varphi^d q_2^d \langle(\xi_0, \xi')\rangle^{-2} \end{pmatrix} \begin{pmatrix} 1 \\ -\langle(\xi_0, \xi')\rangle^1 l_0 b_{-1}^g \beta \end{pmatrix} \Big|_{x_n=0^+} \\ = \left(2\partial_{x_n} \varphi^d - 4q_1^d \beta \text{Re}(l_0 b_{-1}^g) - 2\beta^2 |l_0 b_{-1}^g|^2 \partial_{x_n} \varphi^d q_2^d \right) \Big|_{x_n=0^+}.$$

In $\text{supp}(\chi^0)$ we have

$$(2.77) \quad |l_0 b_{-1}^g|^{-2} \Big|_{x_n=0^+} = |\rho^{g,+}|_{x_n=0^+} - k^2 = \left((\text{Re} \rho^{g,+})^2 + (\text{Im} \rho^{g,+} + \partial_{x_n} \varphi^g + \beta \partial_{x_n} \varphi^d)^2 \right) \Big|_{x_n=0^+}, \\ \text{Re}(l_0 b_{-1}^g) |l_0 b_{-1}^g|^{-2} \Big|_{x_n=0^+} = \text{Re} \rho^{g,+} \Big|_{x_n=0^+}.$$

We then obtain

$$\Sigma = 2\beta^2 |l_0 b_{-1}^g|^2 \partial_{x_n} \varphi^d \left(\beta^{-2} |l_0 b_{-1}^g|^{-2} - 2q_1^d \beta^{-1} (\partial_{x_n} \varphi^d)^{-1} \text{Re} \rho^{g,+} - q_2^d \right) \Big|_{x_n=0^+} \\ = 2\beta^2 |l_0 b_{-1}^g|^2 \partial_{x_n} \varphi^d \left(\beta^{-2} \left(|l_0 b_{-1}^g|^{-2} - (\text{Re} \rho^{g,+})^2 \right) - \mu^d + \left(q_1^d (\partial_{x_n} \varphi^d)^{-1} - \beta^{-1} \text{Re} \rho^{g,+} \right)^2 \right) \Big|_{x_n=0^+} \\ \geq 2\beta^2 |l_0 b_{-1}^g|^2 \partial_{x_n} \varphi^d \left(\beta^{-2} (\partial_{x_n} \varphi^g + \beta \partial_{x_n} \varphi^d)^2 - \mu^d \right) \Big|_{x_n=0^+} \geq C > 0,$$

by (2.63) and since

$$|l_0 b_{-1}^g|^2 \Big|_{x_n=0^+} \geq C > 0, \quad |l_0 b_{-1}^g|^{-2} \Big|_{x_n=0^+} - (\text{Re} \rho^{g,+})^2 \Big|_{x_n=0^+} \geq (\partial_{x_n} \varphi^g + \beta \partial_{x_n} \varphi^d)^2 \Big|_{x_n=0^+},$$

as $|\rho^{g,+}|$ remains bounded in $\text{supp}(\chi^0)$ and by (2.77). Hence, Gårding's inequality yields [Tay81, Mar02]

$$(2.78) \quad \text{Re} \left(M^* \circ B^d \circ M \gamma_1(u^d), \gamma_1(u^d) \right)_0 \geq C |\gamma_1(u^d)|_0^2,$$

for h sufficiently small and $C > 0$.

Combining (2.74), with (2.65), (2.73), (2.75), (2.76) and (2.78), for f and ε sufficiently small we obtain

$$(2.79) \quad h \|u^d\|_1^2 + h |\gamma_1(u^d)|_0^2 + h |\gamma_0(u^d)|_1^2 \leq C \left(\|P_\varphi v\|_0^2 + h^2 \|v\|_1^2 + h^4 |D_{x_n} v^g|_{x_n=0^+}|_0^2 + h |\theta_\varphi|_1^2 + h |\Theta_\varphi|_0^2 \right).$$

Note that the transmission conditions (TC_u) give

$$|\gamma_0(u^g)|_1^2 + |\gamma_1(u^g)|_0^2 \leq C \left(|\gamma_0(u^d)|_1^2 + |\gamma_1(u^d)|_0^2 + |\theta_\varphi|_1^2 + |\Theta_\varphi|_0^2 + h \|v\|_1^2 \right).$$

Recalling that

$$D_{x_n} \text{op}(\chi^0 v) = \text{op}(\chi^0) D_{x_n} v + \underbrace{[D_{x_n}, \text{op}(\chi^0)] v}_{\in h\Psi_T^0},$$

we see that an appropriate linear combination of (2.67) and (2.79) then yields the sought partial Carleman estimate for h sufficiently small. \blacksquare

2.6. Proof of Theorem 2.2. We choose χ^+ , χ^- and χ^0 with values in $[0, 1]$ that satisfy the properties listed in Propositions 2.9, 2.11 and 2.13 respectively and furthermore $\chi^+ + \chi^- + \chi^0 = 1$ in a neighborhood of $K \times \mathbf{R}^n$, which can be achieved by Proposition 2.7.

We recall that $v = e^{\Phi/h} w$. Since $1 - \chi^+ + \chi^- + \chi^0 = 0$ in a neighborhood of $\text{supp}(w)$, we have

$$|D_{x_n} v|_{x_n=0^+}|_0 \leq |\text{op}(\chi^+) D_{x_n} v|_{x_n=0^+}|_0 + |\text{op}(\chi^-) D_{x_n} v|_{x_n=0^+}|_0 + |\text{op}(\chi^0) D_{x_n} v|_{x_n=0^+}|_0 + Ch |D_{x_n} v|_{x_n=0^+}|_0,$$

$$|v|_{x_n=0^+}|_1 \leq |\text{op}(\chi^+) v|_{x_n=0^+}|_1 + |\text{op}(\chi^-) v|_{x_n=0^+}|_1 + |\text{op}(\chi^0) v|_{x_n=0^+}|_1 + Ch |v|_{x_n=0^+}|_1,$$

and

$$\|v\|_1 \leq \|\text{op}(\chi^+) v\|_1 + \|\text{op}(\chi^-) v\|_1 + \|\text{op}(\chi^0) v\|_1 + Ch \|v\|_1.$$

These three inequalities together with (2.19), (2.46), and (2.64) then yield

$$h\|v\|_1^2 + h|v|_{x_n=0^+}|_1^2 + h|D_{x_n} v|_{x_n=0^+}|_0^2 \leq C \left(\|P_\varphi v\|_0^2 + h|\theta_\varphi|_1^2 + h|\Theta_\varphi|_0^2 \right),$$

for h sufficiently small. Observing now that we have

$$\|e^{\Phi/h} D_{x_j} w\|_0 \leq \|D_{x_j} (e^{\Phi/h} w)\|_0 + \|\partial_{x_j} \Phi e^{\Phi/h} w\|_0,$$

and similar inequalities for the norms at the interface $\{x_n = 0^+\}$, and recalling the forms of θ_φ and Θ_φ in (2.11), we can conclude the proof of Theorem 2.2. \blacksquare

3. A

In this section, we prove an interpolation inequality from the Carleman estimate proven in the previous section. This will then yield the controllability result of Theorem 1.1.

With $\alpha \in (0, X_0/2)$, we set $X = (0, X_0) \times \Omega$, $Y = (\alpha, X_0 - \alpha) \times \Omega$.

Theorem 3.1. *There exist $C \geq 0$ and $\delta \in (0, 1)$ such that for $u \in H^1(X)$ that satisfies (TC) and*

$$u|_{(0, X_0) \times \Omega_1} \in H^2((0, X_0), H^2(\Omega_1)) \quad \text{and} \quad u|_{(0, X_0) \times \Omega_2} \in H^2((0, X_0), H^2(\Omega_2)),$$

$$u(x_0, x)|_{x \in \partial\Omega} = 0, \quad x_0 \in (0, X_0), \quad \text{and} \quad u(0, x) = 0, \quad x \in \Omega,$$

we have

$$(3.1) \quad \|u\|_{H^1(Y)} \leq C \|u\|_{H^1(X)}^\delta \left(\|Au\|_{L^2(X)} + \|\partial_{x_0} u(0, x)\|_{L^2(\omega)} \right)^{1-\delta}.$$

Figure 2: Level sets for the weight functions ψ and $\varphi = e^{\lambda\psi}$ in local normal geodesic coordinates. The Carleman estimate of Theorem 2.2 can be applied in a region V close to $(y_0, y', 0)$ (represented with a dashed line).

Before we sketch the proof of Theorem 3.1 we first indicate how the result of Theorem 1.1 follows.

Let ϕ_j , $j \in \mathbf{N}$, be the eigenfunctions of the operator L on Ω , with Dirichlet boundary conditions, and let the associated eigenvalues be μ_j , $j \in \mathbf{N}$, such that $0 < \mu_1 \leq \mu_2 \leq \dots \leq \mu_k \leq \dots$. We let $\mu > 0$ and we apply the interpolation inequality (3.1) to the function $w(x_0, x) = \sum_{\mu_j \leq \mu} a_j \frac{\sinh(\sqrt{\mu_j} x_0)}{\sqrt{\mu_j}} \phi_j(x)$, for $(a_j)_{j \in \mathbf{N}} \subset \mathbf{C}$. This yields Theorem 1.2, following for instance the proof given in [LZ98, Proof of Theorem 3]. This in turn yields Theorem 1.1 by the control construction method introduced in [LR95] (see also [LZ98, Section 5, Proposition 2] or [Mil06, Proof of Theorem 2.4 in Section 4.2]). As a consequence of Theorem 1.1, we have the following observability result.

Corollary 3.2. *There exists a constant $C_{\text{obs}} \geq 0$ such that the solution y to*

$$\begin{cases} -\partial_t y - Ly = 0 & \text{in } Q, \\ q = 0 & \text{on } (0, T) \times \partial\Omega, \\ q(T) = q_T & \text{in } \Omega, \end{cases}$$

with $q_T \in L^2(\Omega)$ satisfies $\|q(0)\|_{L^2(\Omega)}^2 \leq C_{\text{obs}} \|q\|_{L^2((0,T) \times \omega)}^2$.

Remark 3.3. With the technique used in [FI96], i.e., enlarging Ω in the neighborhood of part of $\partial\Omega$, we obtain a similar controllability (resp. observability) result for a localized boundary control (resp. observation).

3.1. Proof of the interpolation inequality. We first prove a local version of the interpolation inequality in a small neighborhood of a point $(y_0, y', 0)$ of the interface $(0, X_0) \times S$.

We place ourselves in normal geodesic coordinates, as in Section 2, in a neighborhood W of $(y_0, y, 0)$ and first construct a weight function ψ in W . We start by defining the following anisotropic distance in \mathbf{R}^{n+1} :

$$\text{dist}_\alpha((a_0, a), (b_0, b')) = \left(\alpha \| (a_0, a') - (b_0, b') \|^2 + |a_n - b_n|^2 \right)^{\frac{1}{2}}, \quad \alpha > 0.$$

Let $(z_0, z) = (y_0, y', z_n)$ be a point in W away from the interface. We suppose $(z_0, z) \in W^d$, i.e., $z_n > 0$ (for consistency with Section 2). For $\gamma > 0$, we set

$$\psi(x_0, x) = \begin{cases} -\text{dist}_\alpha((x_0, x), (z_0, z)) & \text{if } x_n \geq 0, \\ -\text{dist}_\alpha((x_0, x'), (\gamma x_n, z)) & \text{if } x_n < 0. \end{cases}$$

We note that ψ is continuous across the interface $\{x_n = 0\}$ and that

$$\partial_{x_n} \psi(x_0, x) = (x_n - z_n)(\psi(x_0, x))^{-1} \text{ if } x_n \geq 0, \quad \text{and} \quad \partial_{x_n} \psi(x_0, x) = \gamma(\gamma x_n - z_n)(\psi(x_0, x))^{-1} \text{ if } x_n \leq 0,$$

which yields $\partial_{x_n} \psi|_{x_n=0^-} = \gamma \partial_{x_n} \psi|_{x_n=0^+}$. We also have

$$\partial_{x_j} \psi(x_0, x', 0) = \alpha(x_j - z_j)(\psi(x_0, x', 0))^{-1}, \quad j = 0, \dots, n-1.$$

Note that $|x_j - z_j|$ is bounded in W and that we can choose the parameter α sufficiently small to have $|\partial_{x_j} \psi|_{x_n=0}|$, $j = 0, \dots, n-1$ small as compared to $|\partial_{x_n} \psi|_{x_n=0^+}|$. We thus choose α and γ sufficiently small to have ψ satisfying the properties¹ listed in Assumption 2.1 in a sufficiently small neighborhood V of (y_0, y) , $V \subset W$, apart from the sub-ellipticity condition (2.3). Clearly $(z_0, z) \notin V$. Level sets for the function ψ are represented in Figure 2.

We now note that the weight function $\varphi = e^{\lambda\psi}$, $\lambda > 0$, also satisfies those conditions, possibly with different constants, from the homogeneity of the formulae in Assumption 2.1 w.r.t. to the weight function. The proof of Lemma 3 in [LR95, Section 3.B] then yields that φ furthermore satisfies the sub-ellipticity condition (2.3) for λ sufficiently large (see also Theorem 8.6.3 in [Hör63, Chapter 8] and Proposition 28.3.3 in [Hör85a, Chapter 28]). The local Carleman estimate of Theorem 2.2 then follows, with the weight function φ , for a possibly reduced neighborhood that we still denote by V (see Proposition 2.7).

We choose $0 < s_1 < s'_1$ and $0 < \sigma < \sigma'$ such that

$$U' = \{(x, x_0); \|(x_0, x') - (y_0, y')\| < s'_1, |x_n| < \sigma'\} \subset V.$$

We also set

$$U = \{(x, x_0); \|(x_0, x') - (y_0, y')\| < s_1, |x_n| < \sigma\}.$$

We now choose $r_1 < r'_1 < r_2 < \psi(y_0, y) < r'_2 < r_3 < r'_3$, such that

$$C_1 = \{(x_0, x) \in \mathbf{R}^{n+1}; \psi(x_0, x) = r_1\} \quad \text{and} \quad C'_3 = \{(x_0, x) \in \mathbf{R}^{n+1}; \psi(x_0, x) = r'_3\}$$

satisfy $C_1 \cap \mathbf{R}_-^{n+1} \subset U$, $C_1 \cap \mathbf{R}_+^{n+1} \cap U \neq \emptyset$, which is equivalent to having

$$-(\alpha s_1^2 + z_n^2)^{\frac{1}{2}} < r_1,$$

and finally $C'_3 \cap U' \subset \{x_n \leq \sigma\}$. We illustrate these choices in Figure 3. We set $R_j = e^{\lambda r_j}$, $R'_j = e^{\lambda r'_j}$, $j = 1, 2, 3$.

¹depending on the case (1, 2, or 3) satisfied by the considered point (y_0, y) .

Figure 3: Neighborhoods around the point of interest for the proof of the interpolation inequality.

Following [LR95], we introduce

$$V_j := \{(x_0, x) \in U'; r_j < \psi(x_0, x) < r'_j\}, \quad j = 1, 2, 3.$$

and we further set

$$V_{1 \rightarrow 3} := \{(x_0, x) \in U; r'_1 < \psi(x_0, x) < r_3\}, \quad V'_{1 \rightarrow 3'} := \{(x_0, x) \in U'; r_1 < \psi(x_0, x) < r'_3\}$$

$$W_3 = V_3 \cup (V'_{1 \rightarrow 3'} \setminus U).$$

The region W_3 is represented shaded and stripped in Figure 3. With the choices we have made above, the region W_3 is contained in \mathbf{R}_+^{n+1} and is finitely away from the interface $S = \{x_n = 0\}$. We also choose $W_2 \subset V_2$ such that $W_2 \Subset U$. The region W_2 contains $(y_0, y', 0)$ and is represented shaded in Figure 3.

We choose $\zeta \in \mathcal{C}_c^\infty(\mathbf{R}^{n+1})$ such that ζ is equal to one on $V_{1 \rightarrow 3}$ and vanishes outside $V'_{1 \rightarrow 3'}$. Then $\nabla_{x_0, x} \zeta$ vanishes outside $V'_{1 \rightarrow 3'} \setminus V_{1 \rightarrow 3}$ which is the stripped region in Figure 3. For $u \in H^1(W)$ that satisfies (TC), we set $w = \zeta u$. Then w satisfies the following transmission conditions

$$\forall x_0, x', \quad w|_{x_n=0^-} = w|_{x_n=0^+} \quad c \partial_{x_n} w|_{x_n=0^-} = c \partial_{x_n} w|_{x_n=0^+} + \Theta,$$

where $\Theta = (c|_{x_n=0^+} - c|_{x_n=0^-})(u \partial_{x_n} \zeta)|_{x_n=0}$. Note that Θ is supported in $\{x_n = 0\} \cap V_1$.

From the Carleman estimate of Theorem 2.2, after division by h^3 , we have

$$h^{-2} \|e^{\varphi/h} w\|_0^2 + \|e^{\varphi/h} \nabla_{x_0, x} w\|_0^2 \leq C \left(h^1 \|e^{\varphi/h} A u\|_0^2 + h^1 \|e^{\varphi/h} [A, \zeta] u\|_0^2 + |e^{\varphi/h} \Theta|_0^2 \right), \quad 0 < h \leq h_0.$$

Note that $[A, \zeta]$ of order one and supported in $V'_{1 \rightarrow 3'} \setminus V_{1 \rightarrow 3}$. We thus have

$$\|e^{\varphi/h} [A, \zeta] u\|_0 \leq C e^{R'_3/h} \|u\|_{H^1(W_3)} + C e^{R'_1/h} \|u\|_{H^1(V_1)} \leq C e^{R'_3/h} \|u\|_{H^1(W_3)} + C e^{R'_1/h} \|u\|_{H^1(W)}.$$

We also have

$$|e^{\varphi/h}\Theta|_0 \leq Ce^{R'_1/h}\|u\|_{H^1(W)},$$

by the trace formula. We thus obtain

$$(3.2) \quad e^{R_2/h}\|u\|_{H^1(W_2)} \leq Ce^{R'_1/h}\|u\|_{H^1(W)} + Ce^{R'_3/h}(\|u\|_{H^1(W_3)} + \|Au\|_{L^2(W)}), \quad 0 < h \leq h_0.$$

Optimizing w.r.t. to h as in [Rob95] we obtain $\mu_0 \in (0, 1)$ such that the local interpolation inequality

$$(3.3) \quad \|u\|_{H^1(W_2)} \leq C\|u\|_{H^1(W)}^{1-\mu}(\|u\|_{H^1(W_3)} + \|Au\|_{L^2(W)})^\mu$$

holds for $0 < \mu \leq \mu_0$. This inequality can be read as the “observation” of the H^1 norm of u in the neighborhood of any point of the interface by the H^1 norm of u in a neighborhood away from the interface and the L^2 norm of Au

Remark 3.4. As pointed above the region W_3 is contained in \mathbf{R}_+^{n+1} . The case $W_3 \subset \mathbf{R}_-^{n+1}$ can naturally be obtained by changing x_n into $-x_n$ in W .

Now that we have obtained such a local interpolation inequality at the interface, we can apply the procedure described in [LR95, pages 353–356] and prove the sought global interpolation inequality (3.1). See [LZ98, Proof of Theorem 3] to obtain the term $\|\partial_{x_0}u(0, x)\|_{L^2(\omega)}$ in the r.h.s. of (3.1). This concludes the proof of Theorem 3.1.

Acknowledgements: We wish to thank G. Lebeau for encouraging discussions between the two authors on the subject of the article. We also thank Yves Dermenjian and Assia Benabdallah for many discussions on Carleman estimates for operators with non smooth coefficients and N. Lerner for discussions on Carleman estimates and unique continuation. This work was carried out when the first author was on research leaves at Laboratoire POems, INRIA Rocquencourt/ENSTA, CNRS UMR 2706, France and at Université Pierre et Marie Curie, Laboratoire Jacques-Louis Lions, CNRS UMR 7598, Paris, France. The first author was partially supported by l’Agence Nationale de la Recherche under grant ANR-07-JCJC-0139-01.
