TOEPLITZ AND TOEPLITZ-BLOCK-TOEPLITZ MATRICES
AND THEIR CORRELATION WITH SYZYGIES OF POLYNOMIALS

HOUSSAM KHALIL*, BERNARD MOURRAIN†, AND MICHELLE SCHATZMAN‡

Abstract. In this paper, we re-investigate the resolution of Toeplitz systems $T u = g$, from a new point of view, by correlating the solution of such problems with syzygies of polynomials or moving lines. We show an explicit connection between the generators of a Toeplitz matrix and the generators of the corresponding module of syzygies. We show that this module is generated by two elements of degree $n$ and the solution of $T u = g$ can be reinterpreted as the remainder of an explicit vector depending on $g$, by these two generators.

This approach extends naturally to multivariate problems and we describe for Toeplitz-block-Toeplitz matrices, the structure of the corresponding generators.

Key words. Toeplitz matrix, rational interpolation, syzygie

1. Introduction. Structured matrices appear in various domains, such as scientific computing, signal processing, . . . They usually express, in a linearize way, a problem which depends on less parameters than the number of entries of the corresponding matrix. An important area of research is devoted to the development of methods for the treatment of such matrices, which depend on the actual parameters involved in these matrices.

Among well-known structured matrices, Toeplitz and Hankel structures have been intensively studied [3, 4]. Nearly optimal algorithms are known for the multiplication or the resolution of linear systems, for such structure. Namely, if $A$ is a Toeplitz matrix of size $n$, multiplying it by a vector or solving a linear system with $A$ requires $\mathcal{O}(n)$ arithmetic operations (where $\mathcal{O}(n) = \mathcal{O}(n \log^c(n))$ for some $c > 0$) [2, 12]. Such algorithms are called super-fast, in opposition with fast algorithms requiring $\mathcal{O}(n^2)$ arithmetic operations.

The fundamental ingredients in these algorithms are the so-called generators [1], encoding the minimal information stored in these matrices, and on which the matrix transformations are translated. The correlation with other types of structured matrices has also been well developed in the literature [11, 13], allowing to treat so efficiently other structures such as Vandermonde or Cauchy-like structures.

Such problems are strongly connected to polynomial problems [4, 3]. For instance, the product of a Toeplitz matrix by a vector can be deduced from the product of two univariate polynomials, and thus can be computed efficiently by evaluation-interpolation techniques, based on FFT. The inverse of a Hankel or Toeplitz matrix is connected to the Bezoutian of the polynomials associated to their generators.

However, most of these methods involve univariate polynomials. So far, few investigations have been pursued for the treatment of multilevel structured matrices [14], related to multivariate problems. Such linear systems appear for instance in resultant or in residue constructions, in normal form computations, or more generally in multivariate polynomial algebra. We refer to [8] for a general description of such correlations between multi-structured matrices and multivariate polynomials. Surprisingly, they also appear in numerical scheme and preconditioners. A main challenge here is to devise super-fast algorithms of complexity $\mathcal{O}(n)$ for the resolution of multi-structured systems of size $n$.

In this paper, we consider block-Toeplitz matrices, where each block is a Toeplitz matrix. Such a structure, which is the first step to multi-level structures, is involved in many bivariate problems, or in numerical linear problems. We re-investigate first the resolution of Toeplitz systems $T u = g$, from a new point of view, by correlating the solution of such problems with syzygies of polynomials or moving lines. We show an explicit connection between the generators of a Toeplitz matrix and the generators of the corresponding module of syzygies. We show that this module is generated by two elements of degree $n$ and the solution of $T u = g$ can be reinterpreted as the remainder of an explicit vector depending on $g$, by these two generators.
This approach extends naturally to multivariate problems and we describe for Toeplitz-block-Toeplitz matrices, the structure of the corresponding generators. In particular, we show the known result that the module of syzygies of \( k \) non-zero bivariate polynomials is free of rank \( k - 1 \), by a new elementary proof.

Exploiting the properties of moving lines associated to Toeplitz matrices, we give a new point of view to resolve a Toeplitz-block-Toeplitz system.

In the next section we study the scalar Toeplitz case. In the chapter 3 we consider the Toeplitz-block-Toeplitz case.

Let \( R = \mathbb{K}[x] \). For \( n \in \mathbb{N} \), we denote by \( \mathbb{K}[x]_n \) the vector space of polynomials of degree \( \leq n \).

Let \( L = \mathbb{K}[x, x^{-1}] \) be the set of Laurent polynomials in the variable \( x \). For any polynomial \( \varphi = \sum_{i=-m}^n p_i x^i \in L \), we denote by \( \varphi^+ \) the sum of terms with positive exponents: \( \varphi^+ = \sum_{i=0}^n p_i x^i \) and by \( \varphi^- \), the sum of terms with strictly negative exponents: \( \varphi^- = \sum_{i=-m}^{i-1} p_i x^i \). We have \( \varphi = \varphi^+ + \varphi^- \).

For \( n \in \mathbb{N} \), we denote by \( \Omega_\nu = \{ \omega \mid \omega^n = 1 \} \) the set of roots of unity of order \( n \).

2. Univariate case. We begin by the univariate case and the following problem:

**Problem 2.1.** Given a Toeplitz matrix \( T = (t_{i-j})_{i,j=0}^{n-1} \in \mathbb{K}^{n \times n} \) \( (T_{ij} = t_{i-j}) \) of size \( n \) and \( g = (g_0, \ldots, g_{n-1}) \in \mathbb{K}^n \), find \( u = (u_0, \ldots, u_{n-1}) \in \mathbb{K}^n \) such that

\[
Tu = g. \tag{2.1}
\]

Let \( E = \{1, \ldots, x^{n-1}\} \), and \( \Pi_E \) be the projection of \( R \) on the vector space generated by \( E \), along \( \langle x^n, x^{n+1}, \ldots \rangle \).

**Definition 2.2.** We define the following polynomials:

\begin{itemize}
  \item \( T(x) = \sum_{i=0}^{n-1} t_i x^i \),
  \item \( \tilde{T}(x) = \sum_{i=0}^{2n-1} \tilde{t}_i x^i \) with \( \tilde{t}_i = \begin{cases} t_i & \text{if } i < n \\ t_{i-2n} & \text{if } i \geq n \end{cases} \),
  \item \( u(x) = \sum_{i=0}^{n-1} u_i x^i \), \( g(x) = \sum_{i=0}^{n-1} g_i x^i \).
\end{itemize}

Notice that \( \tilde{T} = \varphi^+ + x^{2n} \varphi^- \) and \( T(u) = \tilde{T}(w) \) if \( w \in \Pi_E \). We also have (see \( \#\))

\[ Tu = g \iff \Pi_E(T(x)u(x)) = g(x). \]

For any polynomial \( u \in \mathbb{K}[x] \) of degree \( d \), we denote it as \( u(x) = \underline{u}(x) + x^n \underline{\sigma}(x) \) with \( \deg(\underline{u}) \leq n - 1 \) and \( \deg(\underline{\sigma}) \leq d - n \) if \( d \geq n \) and \( \underline{\sigma} = 0 \) otherwise. Then, we have

\[
Tu(x) = T(x)u(x) + T(x)x^n \underline{\sigma}(x)
\]

\[
= \Pi_E(T(x)u(x)) + \Pi_E(T(x)x^n \underline{\sigma}(x))
\]

\[
+ (\alpha_{-n+1} x^{-n+1} + \cdots + \alpha_{-1} x^{-1})
\]

\[
+ (\alpha_n x^n + \cdots + \alpha_{n+m} x^{n+m})
\]

\[
= \Pi_E(T(x)\underline{u}(x)) + \Pi_E(T(x)x^n \underline{\sigma}(x))
\]

\[
+ x^{-n+1} A(x) + x^n B(x), \tag{2.2}
\]

with \( m = \max(n-2, d-1) \),

\[
A(x) = \alpha_{-n+1} + \cdots + \alpha_{-1} x^{-2},
\]

\[
B(x) = \alpha_n + \cdots + \alpha_{n+m} x^m. \tag{2.3}
\]

See \( \#\) for more details on the correlation between structured matrices and (multivariate) polynomials.

2.1. Moving lines and Toeplitz matrices. We consider here another problem, related to interesting questions in Effective Algebraic Geometry.

**Problem 2.3.** Given three polynomials \( a, b, c \in R \) respectively of degree \( < l, < m, < n \), find three polynomials \( p, q, r \in R \) of degree \( < \nu - l, < \nu - m, < \nu - n \), such that

\[
a(x)p(x) + b(x)q(x) + c(x)r(x) = 0. \tag{2.4}
\]
We denote by $\mathcal{L}(a, b, c)$ the set of $(p, q, r) \in \mathbb{K}[x]^3$ which are solutions of $\left[2.4\right]$. It is a $\mathbb{K}[x]$-module of $\mathbb{K}[x]^3$. The solutions of the problem $\left[2.3\right]$ are $\mathcal{L}(a, b, c) \cap \mathbb{K}[x]_{\nu-1} \times \mathbb{K}[x]_{\nu-m-1} \times \mathbb{K}[x]_{\nu-n-1}$.

Given a new polynomial $d(x) \in \mathbb{K}[x]$, we denote by $\mathcal{L}(a, b, c, d)$ the set of $(p, q, r) \in \mathbb{K}[x]^3$ such that

$$a(x)p(x) + b(x)q(x) + c(x)r(x) = d(x).$$

**Theorem 2.4.** For any non-zero vector of polynomials $(a, b, c) \in \mathbb{K}[x]^3$, the $\mathbb{K}[x]$-module $\mathcal{L}(a, b, c)$ is free of rank 2.

**Proof.** By the Hilbert's theorem, the ideal $I$ generated by $(a, b, c)$ has a free resolution of length at most 1, that is of the form:

$$0 \rightarrow \mathbb{K}[x]^p \rightarrow \mathbb{K}[x]^3 \rightarrow \mathbb{K}[x] \rightarrow \mathbb{K}[x]/I \rightarrow 0.$$ 

As $I \neq 0$, for dimensional reasons, we must have $p = 2$. □

**Definition 2.5.** A $\mu$-base of $\mathcal{L}(a, b, c)$ is a basis $(p, q, r)$ of $\mathcal{L}(a, b, c)$, with $(p, q, r)$ of minimal degree $\mu$.

Notice if $\mu_1$ is the smallest degree of a generator and $\mu_2$ the degree of the second generator $(p', q', r')$, we have $d = \max(\deg(a), \deg(b), \deg(c)) = \mu_1 + \mu_2$. Indeed, we have

$$0 \rightarrow \mathbb{K}[x]_{\nu-d-\mu_1} \oplus \mathbb{K}[x]_{\nu-d-\mu_2} \rightarrow \mathbb{K}[x]_{\nu} \rightarrow \mathbb{K}[x]_{\nu}/(a, b, c)_{\nu} \rightarrow 0,$$

for $\nu \gg 0$. As the alternate sum of the dimension of the $\mathbb{K}$-vector spaces is zero and $\mathbb{K}[x]_{\nu}/(a, b, c)_{\nu}$ is 0 for $\nu \gg 0$, we have

$$0 = 3(d - \nu - 1) + \nu - \mu_1 - d + 1 + \nu - \mu_2 - d + 1 + \nu + 1 = d - \mu_1 - \mu_2.$$

For $\mathcal{L}(\hat{T}(x), x^n, x^{2n} - 1)$, we have $\mu_1 + \mu_2 = 2n$. We are going to show now that in fact $\mu_1 = \mu_2 = n$:

**Proposition 2.6.** The $\mathbb{K}[x]$-module $\mathcal{L}(\hat{T}(x), x^n, x^{2n} - 1)$ has a $n$-basis.

**Proof.** Consider the map

$$\mathbb{K}[x]_{3n-1}^3 \rightarrow \mathbb{K}[x]_{3n-1}$$

$$(p(x), q(x), r(x)) \mapsto \hat{T}(x)p(x) + x^nq(x) + (x^{2n} - 1)r(x)$$

which $3n \times 3n$ matrix is of the form

$$S := \begin{pmatrix} T_0 & 0 & -I_n \\ T_1 & I_n & 0 \\ T_2 & 0 & I_n \end{pmatrix}.$$ 

(2.6)

where $T_0, T_1, T_2$ are the coefficient matrices of $(\hat{T}(x), x\frac{\partial}{\partial x}T(x), \ldots, x^n\frac{\partial^n}{\partial x^n}T(x))$, respectively for the list of monomials $(1, \ldots, x^{n-1}), (x^n, \ldots, x^{2n-1}), (x^{2n}, \ldots, x^{3n-1})$. Notice in particular that $T = T_0 + T_2$.

Reducing the first rows of $(T_0|0|0)$ by the last rows $(T_2|0|I_n)$, we replace it by the block $(T_0 + T_2|0|I_n)$, without changing the rank of $S$. As $T = T_0 + T_2$ is invertible, this shows that the matrix $S$ is of rank $3n$. Therefore, there is no syzygies in degree $n - 1$. As the sum $2n = \mu_1 + \mu_2$ and $\mu_1 \leq n, \mu_2 \leq n$ where $\mu_1, \mu_2$ are the smallest degree of a pair of generators of $\mathcal{L}(\hat{T}(x), x^n, x^{2n} - 1)$ of degree $\leq n$, we have $\mu_1 = \mu_2 = n$. Thus there exist two linearly independent syzygies $(u_1, v_1, w_1), (u_2, v_2, w_2)$ of degree $n$, which generate $\mathcal{L}(\hat{T}(x), x^n, x^{2n} - 1)$. □

A similar result can also be found in [12], but the proof much longer than this one, is based on interpolation techniques and explicit computations. Let us now describe how to construct explicitly two generators of $\mathcal{L}(\hat{T}(x), x^n, x^{2n} - 1)$ of degree $n$ (see also [12]).

As $\hat{T}(x)$ is of degree $\leq 2n - 1$ and the map $\left[2.5\right]$ is a surjective function, there exists $(u, v, w) \in \mathbb{K}[x]_{3n-1}$ such that

$$\hat{T}(x)u(x) + x^n v(x) + (x^{2n} - 1) w = \hat{T}(x)x^n.$$ 

(2.7)
we deduce that \((u_1, v_1, w_1) = (x^n - u, -v, -w) \in \mathcal{L}(\tilde{T}(x), x^n, x^{2n} - 1)\).

As there exists \((u', v', w') \in \mathbb{K}[x]_n\) such that

\[
\tilde{T}(x)u'(x) + x^n v'(x) + (x^{2n} - 1) w' = 1 = x^n x^n - (x^{2n} - 1)
\]

we deduce that \((u_2, v_2, w_2) = (-u', x^n - v', -w' - 1) \in \mathcal{L}(\tilde{T}(x), x^n, x^{2n} - 1)\).

Now, the vectors \((u_1, v_1, w_1), (u_2, v_2, w_2)\) of \(\mathcal{L}(\tilde{T}(x), x^n, x^{2n} - 1)\) are linearly independent since by construction, the coefficient vectors of \(x^n\) in \((u_1, v_1, w_1)\) and \((u_2, v_2, w_2)\) are respectively \((1, 0, 0)\) and \((0, 1, 0)\).

**Proposition 2.7.** The vector \(u\) is solution of (2.1) if and only if there exist \(v(x) \in \mathbb{K}[x]_{n-1}, w(x) \in \mathbb{K}[x]_{n-1}\) such that

\[
(u(x), v(x), w(x)) \in \mathcal{L}(\tilde{T}(x), x^n, x^{2n} - 1; g(x))
\]

**Proof.** The vector \(u\) is solution of (2.1) if and only if we have

\[
\Pi_E(T(x)u(x)) = g(x).
\]

As \(u(x)\) is of degree \(\leq n-1\), we deduce from (2.2) and (2.3) that there exist polynomial \(A(x) \in \mathbb{K}[x]_{n-2}\) and \(B(x) \in \mathbb{K}[x]_{n-1}\) such that

\[
T(x)u(x) - x^{-n+1}A(x) - x^n B(x) = g(x).
\]

By evaluation at the roots \(\omega \in \Omega_{2n}\), and since \(\omega^{-n} = \omega^n\) and \(\tilde{T}(\omega) = T(\omega)\) for \(\omega \in \Omega_n\), we have

\[
\tilde{T}(\omega)u(\omega) + \omega^n v(\omega) = g(\omega), \forall \omega \in \Omega_{2n}(\omega),
\]

with \(v(x) = -x A(x) - B(x)\) of degree \(\leq n - 1\). We deduce that there exists \(w(x) \in \mathbb{K}[x]\) such that

\[
\tilde{T}(x)u(x) + x^n v(x) + (x^{2n} - 1) w(x) = g(x).
\]

Notice that \(w(x)\) is of degree \(\leq n - 1\), because \((x^{2n} - 1) w(x)\) is of degree \(\leq 3n - 1\).

Conversely, a solution \((u(x), v(x), w(x)) \in \mathcal{L}(\tilde{T}(x), x^n, x^{2n} - 1; g(x)) \cap \mathbb{K}[x]_{n-1}\) implies a solution \((u, v, w) \in \mathbb{K}[x]_n\) of the linear system:

\[
S \begin{pmatrix} u \\ v \\ w \end{pmatrix} = \begin{pmatrix} g \\ 0 \\ 0 \end{pmatrix}
\]

where \(S\) is has the block structure (2.6), so that \(T_2 u + w = 0\) and \(T_0 u - w = (T_0 + T_2) u = g\). As we have \(T_0 + T_2 = T\), the vector \(u\) is a solution of (2.1), which ends the proof of the proposition.

**2.2. Euclidean division.** As a consequence of proposition 2.8, we have the following property:

**Proposition 2.8.** Let \(\{(u_1, v_1, w_1), (u_2, v_2, w_2)\}\) a \(n\)-basis of \(\mathcal{L}(\tilde{T}(x), x^n, x^{2n} - 1)\), the remainder of the division of \(\begin{pmatrix} x^n g \\ g \end{pmatrix}\) by \(\begin{pmatrix} u_1 & u_2 \\ v_1 & v_2 \\ w_1 & w_2 \end{pmatrix}\) is the vector solution given in the proposition 2.7.

**Proof.** The vector \(\begin{pmatrix} 0 \\ x^n g \\ -g \end{pmatrix} \in \mathcal{L}(\tilde{T}(x), x^n, x^{2n} - 1; g)\) (a particular solution). We divide it by \(\begin{pmatrix} u_1 & u_2 \\ v_1 & v_2 \\ w_1 & w_2 \end{pmatrix}\) we obtain

\[
\begin{pmatrix} u \\ v \\ w \end{pmatrix} = \begin{pmatrix} 0 \\ x^n g \\ g \end{pmatrix} - \begin{pmatrix} u_1 & u_2 \\ v_1 & v_2 \\ w_1 & w_2 \end{pmatrix} \begin{pmatrix} p \\ q \end{pmatrix}
\]
(u, v, w) is the remainder of division, thus (u, v, w) ∈ ℤ[x]_{n-1}^3 ∩ L(T(x), x^n, x^{2n} − 1; g). However (u, v, w) is the unique vector in ℤ[x]_{n-1}^3 ∩ L(T(x), x^n, x^{2n} − 1; g) because if there is another vector then their difference is in L(T(x), x^n, x^{2n} − 1) ∩ ℤ[x]_{n-1}^3 which is equal to \{0, 0, 0\}.

**Problem 2.9.** Given a matrix and a vector of polynomials \((e(x), e'(x))\) of degree \(n\), find the remainder of the division of \((p(x), q(x))\) of degree \(m\), such that \(\left( e_n, e'_n \right) \) is invertible; find the remainder of the division of \((p(x), q(x))\) by \((e(x), e'(x))\).

**Proposition 2.10.** The first coordinate of remainder vector of the division of \((0, x^n g)\) by \((u, u')\) is the polynomial \(v(x)\) solution of (2.9).

We describe here a generalized Euclidean division algorithm to solve problem (2.9).

Let \(E(x) = (p(x), q(x))\) of degree \(m\), \(B(x) = (e(x), e'(x))\) of degree \(n \leq m\). \(E(x) = B(x)Q(x) + R(x)\) with \(\deg(R(x)) < n\), \(\deg(Q(x)) \leq m - n\). Let \(z = \frac{1}{x}\),

\[
\begin{align*}
E(x) &= B(x)Q(x) + R(x) \\
\Rightarrow E(\frac{1}{z}) &= B(\frac{1}{z})Q(\frac{1}{z}) + R(\frac{1}{z}) \\
\Rightarrow zE(\frac{1}{z}) &= z^nB(\frac{1}{z})z^{m-n}Q(\frac{1}{z}) + z^{m-n+1}z^{n-1}R(\frac{1}{z}) \\
\Rightarrow \hat{E}(z) &= \hat{B}(z)\hat{Q}(z) + z^{m-n+1}\hat{R}(z)
\end{align*}
\]

with \(\hat{E}(z), \hat{B}(z), \hat{Q}(z), \hat{R}(z)\) are the polynomials obtained by reversing the order of coefficients of polynomials \(E(z), B(z), Q(z), R(z)\).

\[
\begin{align*}
\frac{1}{B(z)} \Rightarrow \frac{\hat{E}(z)}{\hat{B}(z)} &= \frac{\hat{Q}(z) + z^{m-n+1}\hat{R}(z)}{\hat{B}(z)} \\
\Rightarrow \hat{Q}(z) &= \frac{\hat{E}(z)}{\hat{B}(z)} \mod z^{m-n+1}
\end{align*}
\]

exists because its coefficient of highest degree is invertible. Thus \(\hat{Q}(z)\) is obtained by computing the first \(m - n + 1\) coefficients of \(\frac{\hat{E}(z)}{\hat{B}(z)}\).

To find \(W(x) = \frac{1}{B(x)}\) we will use Newton’s iteration: Let \(f(W) = \hat{B} - W^{-1}\).

\[
f'(W_l)(W_{l+1} - W_l) = -W_l^{-1}(W_l + 1 - W_l)W_l^{-1} = f(W_l) = \hat{B} - W_l^{-1}
\]

thus

\[
W_{l+1} = 2W_l - W_l\hat{B}W_l.
\]

and \(W_0 = \hat{B}_0^{-1}\) which exists.

\[
W - W_{l+1} = W - 2W_l + W_l\hat{B}W_l = W(1 - \hat{B}W_l)^2 = (W - W_l)\hat{B}(W - W_l)
\]

Thus \(W_l(x) = W(x) \mod x^{2l}\) for \(l = 0, \ldots, [\log(m - n + 1)]\).

**Proposition 2.11.** We need \(O(n \log(n) \log(m - n) + m \log m)\) arithmetic operations to solve problem (2.9).

**Proof.** We must do \([\log(m - n + 1)]\) Newton’s iteration to obtain the first \(m - n + 1\) coefficients of \(\frac{1}{B} = W(x)\). And for each iteration we must do \(O(n \log n)\) arithmetic operations (multiplication of polynomials of degree \(n\)). And then we need \(O(m \log m)\) arithmetic operations to do the multiplication \(\hat{E} \frac{1}{B}\).

\[
\hat{E} \frac{1}{B}
\]
2.3. Construction of the generators. The canonical basis of $\mathbb{K}[x]^3$ is denoted by $\sigma_1, \sigma_2, \sigma_3$. Let $\rho_1, \rho_2$ the generators of $\mathcal{L}(T(x), x^n, x^{2n} - 1)$ of degree $n$ given by

$$
\begin{align*}
\rho_1 &= x^n \sigma_1 - (u, v, w) = (u_1, v_1, w_1) \\
\rho_2 &= x^n \sigma_2 - (u', v', w') = (u_2, v_2, w_2)
\end{align*}
$$

with $(u, v, w), (u', v', w')$ are the vector given in (2.7) and (2.8).

We will describe here how we compute $(u_1, v_1, w_1)$ and $(u_2, v_2, w_2)$. We will give two methods to compute them, the second one is the method given in [12]. The first one use the Euclidean gcd algorithm:

We will recall firstly the algebraic and computational properties of the well known extended Euclidean algorithm (see [13]): Given $p(x), p'(x)$ two polynomials in degree $m$ and $m'$ respectively, let

$$
r_0 = p, \quad s_0 = 1, \quad t_0 = 0, \quad r_1 = p', \quad s_1 = 0, \quad t_1 = 1.
$$

and define

$$
r_{i+1} = r_{i-1} - q_i r_i, \quad s_{i+1} = s_{i-1} - q_i s_i, \quad t_{i+1} = t_{i-1} - q_i t_i,
$$

where $q_i$ results when the division algorithm is applied to $r_{i-1}$ and $r_i$, i.e. $r_{i-1} = q_i r_i + r_{i+1} \cdot \deg r_{i+1} < \deg r_i$ for $i = 1, \ldots, l$ with $l$ is such that $r_l = 0$, therefore $r_{l-1} = \gcd(p(x), p'(x))$.

**Proposition 2.12.** The following relations hold:

$$s_i p + t_i p' = r_i \quad \text{and} \quad (s_i, t_i) = 1 \quad \text{for } i = 1, \ldots, l$$

and

$$
\begin{align*}
\deg r_{i+1} &< \deg r_i, \quad i = 1, \ldots, l - 1 \\
\deg s_{i+1} &> \deg s_i \quad \text{and} \quad \deg t_{i+1} > \deg t_i, \\
\deg s_{i+1} &= \deg(q_i, s_i) = \deg v - \deg r_i, \\
\deg t_{i+1} &= \deg(q_i, t_i) = \deg u - \deg r_i.
\end{align*}
$$

**Proposition 2.13.** By applying the Euclidean gcd algorithm in $p(x) = x^{n-1} T$ and $p'(x) = x^{2n-1}$ in degree $n - 1$ and $n - 2$ we obtain $\rho_1$ and $\rho_2$ respectively.

**Proof.** We saw that $Tu = g$ if and only if there exist $A(x)$ and $B(x)$ such that

$$
\mathcal{T}(x)u(x) + x^{2n-1}B(x) = x^{n-1}b(x) + A(x)
$$

with $\mathcal{T}(x) = x^{n-1}T(x)$ a polynomial of degree $\leq 2n - 2$. In (2.7) and (2.8) we saw that for $g(x) = 1$ (g = $e_1$) and $g(x) = x^n T(x)$ ($g = (0, t_{n+1}, \ldots, t_{l-1})^T$) we obtain a base of $\mathcal{L}(\mathcal{T}(x), x^n, x^{2n} - 1)$. $Tu_1 = e_1$ if and only if there exist $A_1(x), B_1(x)$ such that

$$
\mathcal{T}(x)u_1(x) + x^{2n-1}B_1(x) = x^{n-1} + A_1(x)
$$

and $Tu_2 = (0, t_{n+1}, \ldots, t_{l-1})^T$ if and only if there exist $A_2(x), B_2(x)$ such that

$$
\mathcal{T}(x)(u_2(x) + x^n) + x^{2n-1}B_2(x) = A_2(x)
$$

with $\deg A_1(x) \leq n - 2$ and $\deg A_2(x) \leq n - 2$. Thus By applying the extended Euclidean algorithm in $p(x) = x^{n-1} T$ and $p'(x) = x^{2n-1}$ until we have $\deg r_{l}(x) = n - 1$ and $\deg r_{l+1}(x) = n - 2$ we obtain

$$
u_1(x) = \frac{1}{c_1} s_1(x), \quad B_1(x) = \frac{1}{c_1} t_1(x), \quad x^{n-1} + A_1(x) = \frac{1}{c_1} r_l(x)$$

and

$$
u_2(x) = \frac{1}{c_2} s_1(x), \quad B_2(x) = \frac{1}{c_2} t_1(x), \quad x^{n-1} + A_2(x) = \frac{1}{c_2} r_{l+1}(x)$$
and
\[ x^n + u_2(x) = \frac{1}{c_2}s_{l+1}(x), \quad B_2(x) = \frac{1}{c_2}l_{t+1}(x), \quad A_2(x) = \frac{1}{c_2}r_{l+1}(x) \]

with \( c_1 \) and \( c_2 \) are the highest coefficients of \( r_l(x) \) and \( s_{l+1}(x) \) respectively, in fact: The equation \((2.11)\) is equivalent to

\[
\begin{pmatrix}
\begin{array}{cccc}
\tau_{n+1} & \cdots & \tau_{n+2} & \\
\vdots & \ddots & \vdots & \\
\tau_0 & \cdots & \tau_1 & 1 \\
\end{array}
\end{pmatrix}
\begin{pmatrix}
\begin{array}{c}
u_1 \\
\vdots \\
\nu_{n-1} \\
\end{array}
\end{pmatrix}
= \begin{pmatrix}
\begin{array}{c}
u_{n+1} \\
\vdots \\
\nu_{n+2} \\
1 \\
\end{array}
\end{pmatrix}
\]

since \( T \) is invertible then the \((2n-1) \times (2n-1)\) block at the bottom is invertible and then \( u_1 \) and \( B_1 \) are unique, therefore \( u_1, B_1 \) and \( A_1 \) are unique. And, by proposition \((2.12)\), \( \deg r_l = n-1 \)
(\( r_l = c_1(x^n + A_1(x)) \)) then \( \deg s_{l+1} = (2n-1) - (n-1) = n \) and \( \deg l_{t+1} = (2n-2) - (n-1) = n-1 \) thus, by the same proposition, \( \deg s_l \leq n-1 \) and \( \deg t_l \leq n-2 \). Therefore \( \frac{1}{c_1} s_l = u_1 \) and \( \frac{1}{c_1} t_l = B_1 \).

Finally, \( Tu = c_1 \) if and only if there exist \( v(x) \), \( w(x) \) such that
\[
\tilde{T}(x)u(x) + x^n v(x) + (x^{2n} - 1)w(x) = 1 \tag{2.13}
\]

\[
\tilde{T}(x) = T^+ + x^{2n} T^- = T + (x^{2n} - 1) T^- \text{Thus}
\]

\[
T(x)u(x) + x^n v(x) + (x^{2n} - 1)w(x) + T^-(x)u(x)) = 1 \tag{2.14}
\]

are unique, therefore \( u_1 \), \( B_1 \) and \( A_1 \) are unique. And, by proposition \((2.12)\), \( \deg r_l = n-1 \)
(\( r_l = c_1(x^n + A_1(x)) \)) then \( \deg s_{l+1} = (2n-1) - (n-1) = n \) and \( \deg l_{t+1} = (2n-2) - (n-1) = n-1 \) thus, by the same proposition, \( \deg s_l \leq n-1 \) and \( \deg t_l \leq n-2 \). Therefore \( \frac{1}{c_1} s_l = u_1 \) and \( \frac{1}{c_1} t_l = B_1 \).

By comparing \((2.14)\) and \((2.15)\), and as \( 1 = x^n + (x^{2n} - 1) \) we have the proposition and we have \( w(x) = x^{-n+1} A_1(x) - T_-(x) u(x) + 1 \) which is the part of positif degree of \(-T_-(x) u(x) + 1 \).

Remark 2.14. A superfast euclidean gcd algorithm, wich uses no more then \( \mathcal{O}(n \log^3 n) \), is given in \[12\] chapter 11.

The second methode to compute \((u_1, v_1, w_1)\) and \((u_2, v_2, w_2)\) is given in \[12\]. We are interested in computing the coefficients of \( \sigma_1, \sigma_2, \) the coefficients of \( \sigma_3 \) correspond to elements in the ideal \((x^{2n}-1)\)
and thus can be obtain by reduction of \( \tilde{T}(x) x^n \cdot B(x) \) by \( x^{2n}-1 \), with \( B(x) = \begin{pmatrix}
\begin{array}{cc}
-x^n - u_0 & -v_0 \\
u_1 & -u_1 \\
\end{array}
\end{pmatrix}
\)

\[
\begin{pmatrix}
u(x) \\
u'(x) \\
\end{pmatrix}
\]

A superfast algorithm to compute \( B(x) \) is given in \[12\]. Let us describe how to compute it.

By evaluation of \((2.10)\) at the roots \( \omega_j \in \Omega_{2n} \) we deduce that \((u(x) v(x))^T \) and \((u'(x) v'(x))^T \) are the solution of the following rational interpolation problem:

\[
\begin{pmatrix}
u_{n+1} \\
u_{n+2} \\
\end{pmatrix}
= \begin{pmatrix}
u_1 \\
u_2 \\
\end{pmatrix}
\]

Definition 2.15. The \( \tau \)-degree of a vector polynomial \( w(x) = (w_1(x) w_2(x))^T \) is defined as

\[
\tau - \deg w(x) := \max \{ \deg w_1(x), \deg w_2(x) - \tau \}
\]
Let \( B(x) \) is a \( n \)-reduced basis of the module of all vector polynomials \( r(x) \in \mathbb{K}[x]^2 \) that satisfy the interpolation conditions
\[
f_j^T r(\omega_j) = 0, \quad j = 0, \ldots, 2n - 1
\]
with \( f_j = \left( \tilde{T}(\omega_j) \right) \).

\( B(x) \) is called a \( \tau \)-reduced basis (with \( \tau = n \)) that corresponds to the interpolation data \((\omega_j, f_j), j = 0, \ldots, 2n - 1\).

**Definition 2.16.** A set of vector polynomial in \( \mathbb{K}[x]^2 \) is called \( \tau \)-reduced if the \( \tau \)-highest degree coefficients are linearly independent.

**Theorem 2.17.** Let \( \tau = n \). Suppose \( J \) is a positive integer. Let \( \sigma_1, \ldots, \sigma_J \in \mathbb{K} \) and \( \phi_1, \ldots, \phi_J \in \mathbb{K}^2 \) which are \( \sigma_i \neq (00)^T \). Let \( 1 \leq j \leq J \) and \( \tau_j \in \mathbb{Z} \). Suppose that \( B_j(x) \in \mathbb{K}[x]^{2 \times 2} \) is a \( \tau_j \)-reduced basis matrix with basis vectors having \( \tau_j \)-degree \( \delta_1 \) and \( \delta_2 \), respectively, corresponding to the interpolation data \( \{(\sigma_i, \phi_i); i = 1, \ldots, J\} \).

Let \( \tau_{j,\tau} := \delta_1 - \delta_2 \). Let \( B_{j,\tau}\) be a \( \tau_{j,\tau} \)-reduced basis matrix corresponding to the interpolation data \( \{(\sigma_i, \phi_i); i = j + 1, \ldots, J\} \).

Then \( B_{j,\tau}(x) := B_j(x)B_{j,\tau}(x) \) is a \( \tau_j \)-reduced basis matrix corresponding to the interpolation data \( \{(\sigma_i, \phi_i); i = 1, \ldots, J\} \).

**Proof.** For the proof, see \([12]\). □

When we apply this theorem for the \( \omega_i \in \Omega_{2n} \) as interpolation points, we obtain a superfast algorithm \( \mathcal{O}(n \log^2 n) \) with which compute \( B(x) \). \( \Box \)

We consider the following two problems:

**3. Bivariate case.** Let \( m \in \mathbb{N} \), \( m \in \mathbb{N} \). In this section we denote by \( E = \{(i, j); 0 \leq i \leq m - 1, 0 \leq j \leq n - 1\} \), and \( R = \mathbb{K}[x, y] \). We denote by \( \mathbb{K}[x, y]_m \) the vector space of bivariate polynomials of degree \( \leq m \) in \( x \) and \( \leq n \) in \( y \).

**Notation 3.1.** For a block matrix \( M \), of block size \( n \) and each block is of size \( m \), we will use the following indication:
\[
M = (M_{(i_1, j_1), (j_2, j_2)})_{0 \leq i_1, j_1 \leq m - 1} = (M_{\alpha, \beta})_{\alpha, \beta \in E}.
\]

\((i_1, j_1)\) gives the block’s positions, \((i_2, j_2)\) the position in the blocks.

**Problem 3.2.** Given a Toeplitz block Toeplitz matrix \( T = (T_{\alpha, \beta})_{\alpha, \beta \in E} \in \mathbb{K}^{m \times m} \) \( T = (T_{\alpha, \beta})_{\alpha, \beta \in E} \) with \( T_{\alpha, \beta} = t_{\alpha - \beta} \) of size \( mn \) and \( g = (g_\alpha)_{\alpha \in E} \in \mathbb{K}^{mn} \), find \( u = (u_\alpha)_{\alpha \in E} \) such that
\[
Tu = g
\]

**Definition 3.3.** We define the following polynomials:

\[
\begin{align*}
T(x, y) & := \sum_{(i, j) \in E} t_{i,j} x^iy^j, \\
\tilde{T}(x, y) & := \sum_{i,j=0}^{2n-1, 2m-1} \tilde{t}_{i,j} x^iy^j \quad \text{with}
\end{align*}
\]

\[
\tilde{t}_{i,j} := \begin{cases} 
  t_{i,j} & \text{si } i < m, j < n \\
  t_{i-2m,j} & \text{si } i \geq m, j < n \\
  t_{i,j-2n} & \text{si } i < m, j \geq n \\
  t_{i-2m,j-2n} & \text{si } i \geq m, i \geq n
\end{cases}
\]

\[
u(x, y) := \sum_{(i,j) \in E} \nu_{i,j} x^iy^j, \quad g(x, y) := \sum_{(i,j) \in E} g_{i,j} x^iy^j.
\]

**3.1. Moving hyperplanes.** For any non-zero vector of polynomials \( a = (a_1, \ldots, a_n) \in \mathbb{K}[x, y]^n \), we denote by \( \mathcal{L}(a) \) the set of vectors \((h_1, \ldots, h_n) \in \mathbb{K}[x, y]^n \) such that
\[
\sum_{i=1}^{n} a_i h_i = 0.
\]

(3.3)
It is a $\mathbb{K}[x, y]$-module of $\mathbb{K}[x, y]^n$.

**Proposition 3.4.** The vector $u$ is solution of (3.2) if and only if there exist $h_2, \ldots, h_9 \in \mathbb{K}[x, y]_{m-1}$ such that $(u(x, y), h_2(x, y), \ldots, h_9(x, y))$ belongs to $L(T(x, y), x^n, x^{2m} - 1, y^n, x^m y^n, (x^{2m} - 1)y^n, y^{2n} - 1, x^m (y^{2n} - 1), (x^{2m} - 1)(y^{2n} - 1))$.

**Proof.** Let $L = \{x^{\alpha_1} y^{\alpha_2} : 0 \leq \alpha_1 \leq m - 1, 0 \leq \alpha_2 \leq n - 1\}$, and $\Pi_E$ the projection of $R$ on the vector space generated by $L$. By (3.2), we have

$$Tu = g \iff \Pi_E(T(x, y)u(x, y)) = g(x, y)$$

(3.4)

which implies that

$$T(x, y)u(x, y) = (x^m y^n A_1(x, y) + x^m y^{-n} A_2(x, y) + x^{-m} y^n A_3(x, y) + x^{-m} y^{-n} A_4(x, y) + x^m A_5(x, y) + x^{-m} A_6(x, y) + y^n A_7(x, y) + y^{-n} A_8(x, y),$$

(3.5)

where the $A_i(x, y)$ are polynomials of degree at most $m - 1$ in $x$ and $n - 1$ in $y$. Since $\omega^m = \omega^{-m}$, $v^n = v^{-n}$, $\bar{T}(\omega, v) = T(\omega, v)$ for $\omega \in U_{2m}$, $v \in U_{2n}$, we deduce by evaluation at the roots $\omega \in U_{2m}$, $v \in U_{2n}$, that

$$R(x, y) := \bar{T}(x, y)u(x, y) = x^m h_2(x, y) + y^n h_4(x, y) + x^m y^n h_5(x, y) - g(x, y) \in (x^{2m} - 1, y^{2n} - 1)$$

with $h_2 = -(A_5 + A_6)$, $h_4 = -(A_7 + A_8)$, $h_5 = -(A_1(x, y) + A_2(x, y) + A_3(x, y) + A_4(x, y))$.

By reduction by the polynomials $x^{2m} - 1, y^{2n} - 1$, and as $R(x, y)$ is of degree $\leq 3m - 1$ in $x$ and $\leq 3n - 1$ in $y$, there exist $h_3(x, y), h_6(x, y), \ldots, h_8(x, y) \in \mathbb{K}[x, y]_{m-1}$ such that

$$(x^m h_2(x, y) + (x^{2m} - 1) h_3(x, y) + y^n h_4(x, y) + x^m y^n h_5(x, y) + (x^{2m} - 1) y^n h_6(x, y) + (y^{2n} - 1) h_7(x, y) + x^m (y^{2n} - 1) h_8(x, y) = g(x, y).$$

Conversely a solution of (3.6) can be transformed into a solution of (3.2), which ends the proof of the proposition.

In the following, we are going to denote by $T$ the vector $T = (\bar{T}(x, y), x^m, x^{2m} - 1, y^n, x^m y^n, (x^{2m} - 1) y^n, y^{2n} - 1, x^m (y^{2n} - 1), (x^{2m} - 1)(y^{2n} - 1))$.

**Proposition 3.5.** There is no elements of $\mathbb{K}[x, y]_{m-1}$ in $L(T)$.

**Proof.** We consider the map

$$\mathbb{K}[x, y]_{m-1}^9 \to \mathbb{K}[x, y]_{3m-1}$$

$$p(x, y) = (p_1(x, y), \ldots, p_9(x, y)) \mapsto T.p$$

(3.8)

(3.9)

which $9mn \times 9mn$ matrix is of the form

$$S := \begin{pmatrix}
E_{21} & -E_{11} + E_{31} & & & & & -E_{11} & -E_{21} & E_{11} - E_{31} \\
& \vdots & & & & & \vdots & \vdots & \\
E_{2n} & -E_{1n} + E_{3n} & & & & & -E_{1n} & -E_{2n} & E_{1n} - E_{3n} \\
T_0 & & & & & & & & \\
& T_1 & & & & & & & \\
& & T_2 & & & & & & \\
E_{11} & E_{21} & -E_{11} + E_{31} & & & & -E_{11} & -E_{21} & E_{11} + E_{31} \\
& \vdots & \vdots & \vdots & & & \vdots & \vdots & \vdots \\
E_{1n} & E_{2n} & -E_{1n} + E_{3n} & & & & -E_{1n} & -E_{2n} & E_{1n} + E_{3n} \\
& & E_{11} & E_{21} & -E_{11} + E_{31} & & -E_{11} & -E_{21} & E_{11} + E_{31} \\
& & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\
& & E_{1n} & E_{2n} & -E_{1n} + E_{3n} & & -E_{1n} & -E_{2n} & E_{1n} + E_{3n} \\
\end{pmatrix}$$

(3.10)

with $E_{ij}$ is the $3m \times mn$ matrix $e_{ij} \otimes I_m$ and $e_{ij}$ is the $3 \times n$ matrix with entries equal zero except
the \((i,j)\)th entry equal 1. And the matrix \(\begin{pmatrix} T_0 \\ T_1 \\ T_2 \end{pmatrix}\) is the following \(9mn \times m\) matrix

\[
\begin{pmatrix}
t_0 & 0 & \ldots & 0 \\
t_1 & t_0 & \ldots & 0 \\
\vdots & \ddots & \ddots & \vdots \\
t_{n-1} & \ldots & t_1 & t_0 \\
0 & t_{n-1} & \ldots & t_1 \\
t_{-n+1} & 0 & \ldots & \vdots \\
\vdots & \ddots & \ddots & \vdots \\
t_{-1} & \ldots & t_{-n+1} & 0 \\
0 & t_{-1} & \ldots & t_{-n+1} \\
\vdots & \ddots & \ddots & \vdots \\
0 & \ldots & \ldots & t_{-1} \\
0 & \ldots & \ldots & 0
\end{pmatrix}
\]

and \(t_i = \begin{pmatrix} t_{i,0} \\ t_{i,1} \\ \ldots \\ t_{i,0} \\
0 & t_{i,m-1} & \ldots & t_{i,1} \\
t_{i,m-1} & 0 & \ldots & \vdots \\
\vdots & \ddots & \ddots & \vdots \\
t_{i,-1} & \ldots & t_{i,-m+1} & 0 \\
0 & \ldots & \ldots & t_{i,-1} \\
0 & \ldots & \ldots & 0
\end{pmatrix}\)

For the same reasons in the proof of proposition (2.9) the matrix \(S\) is invertible. 

**Theorem 3.6.** For any non-zero vector of polynomials \(a = (a_i)_{i=1 \ldots n} \in \mathbb{K}[x,y]^n\), the \(\mathbb{K}[x,y]\)-module \(L(a_1, \ldots, a_n)\) is free of rank \(n - 1\).

**Proof.** Consider first the case where \(a_i\) are monomials, 

\(a_i = x^i y^j\) that are sorted in lexicographic order such that \(x < y\), \(a_1\) being the biggest and \(a_n\) the smallest. Then the module of syzygies of \(a\) is generated by the \(S\)-polynomials:

\[S(a_i, a_j) = \text{lcm}(a_i, a_j) \left( \frac{\sigma_i}{a_i} - \frac{\sigma_j}{a_j} \right),\]

where \((\sigma_i)_{i=1 \ldots n}\) is the canonical basis of \(\mathbb{K}[x,y]^n\). We easily check that \(S(a_i, a_k) = \frac{\text{lcm}(a_i, a_k)}{\text{lcm}(a_i, a_j)} S(a_i, a_j) - \frac{\text{lcm}(a_i, a_k)}{\text{lcm}(a_i, a_j)} S(a_j, a_k)\) if \(i \neq j \neq k\) and \(\text{lcm}(a_i, a_j)\) divides \(\text{lcm}(a_i, a_k)\). Therefore \(L(a)\) is generated by the \(S(a_i, a_j)\) which are minimal for the division, that is, by \(S(a_i, a_{i+1})\) (for \(i = 1, \ldots, n - 1\)), since the monomials \(a_i\) are sorted lexicographically. As the syzygies \(S(a_i, a_{i+1})\) involve the basis elements \(\sigma_i, \sigma_{i+1}\), they are linearly independent over \(\mathbb{K}[x,y]\), which shows that \(L(a)\) is a free module of rank \(n - 1\) and that we have the following resolution:

\[0 \rightarrow \mathbb{K}[x,y]^{n-1} \rightarrow \mathbb{K}[x,y]^n \rightarrow (a) \rightarrow 0.\]

Suppose now that \(a_i\) are general polynomials \(\in \mathbb{K}[x,y]\) and let us compute a Gröbner basis of \(a_i\), for a monomial ordering refining the degree \(\sigma\). We denote by \(m_1, \ldots, m_s\) the leading terms of the polynomials in this Gröbner basis, sorted by lexicographic order.

The previous construction yields a resolution of \((m_1, \ldots, m_s)\):

\[0 \rightarrow \mathbb{K}[x,y]^{s-1} \rightarrow \mathbb{K}[x,y]^s \rightarrow (m_i)_{i=1 \ldots s} \rightarrow 0.\]

Using \(\sigma\) (or \(\sigma\)), this resolution can be deformed into a resolution of \((a)\), of the form

\[0 \rightarrow \mathbb{K}[x,y]^p \rightarrow \mathbb{K}[x,y]^n \rightarrow (a) \rightarrow 0,\]

which shows that \(L(a)\) is also a free module. Its rank \(p\) is necessarily equal to \(n - 1\), since the alternate sum of the dimensions of the vector spaces of elements of degree \(\leq \nu\) in each module of this resolution should be 0, for \(\nu \in \mathbb{N}\).

**3.2. Generators and reduction.** In this section, we describe an explicit set of generators of \(L(T)\). The canonical basis of \(\mathbb{K}[x,y]^n\) is denoted by \(\sigma_1, \ldots, \sigma_9\).

First as \(T(x,y)\) is of degree \(\leq 2m - 1\) in \(x\) and \(\leq 2n - 1\) in \(y\) and as the function \(\sigma_7\) in surjective, there exists \(u_1, u_2 \in \mathbb{K}[x,y]^{\sigma_9}_{n-1}\) such that \(T \cdot u_1 = T(x,y)x^{m_1}, T \cdot u_2 = T(x,y)y^n\). Thus,

\[\rho_1 = x^m \sigma_1 - u_1 \in L(T), \quad \rho_2 = y^n \sigma_1 - u_2 \in L(T).\]
We also have \( u_3 \in \mathbb{K}[x, y]_{n-1} \), such that \( T \cdot u_3 = 1 = x^m x^m - (x^{2m} - 1) = y^n y^n - (y^{2n} - 1) \). We deduce that

\[
\rho_3 = x^m \sigma_2 - \sigma_3 - u_3 \in L(T), \\
\rho_4 = y^n \sigma_4 - \sigma_7 - u_3 \in L(T).
\]

Finally, we have the obvious relations:

\[
\rho_5 = y^\sigma_2 - \sigma_5 \in L(T), \\
\rho_6 = x^m \sigma_4 - \sigma_5 \in L(T), \\
\rho_7 = x^m \sigma_5 - \sigma_6 + \sigma_4 \in L(T), \\
\rho_8 = y^\sigma_5 - \sigma_8 + \sigma_2 \in L(T).
\]

**Proposition 3.7.** The relations \( \rho_1, \ldots, \rho_8 \) form a basis of \( L(T) \).

**Proof.** Let \( h = (h_1, \ldots, h_9) \in L(T) \). By reduction by the previous elements of \( L(T) \), we can assume that the coefficients \( h_1, h_2, h_4, h_5 \) are in \( \mathbb{K}[x, y]_{m-1} \). Thus, \( T(x, y)h_1 + x^m h_2 + y^n h_4 + x^m y^n h_5 \in (x^{2n} - 1, y^{2m} - 1) \). As this polynomial is of degree \( \leq 3m - 1 \) in \( x \) and \( \leq 3n - 1 \) in \( y \), by reduction by the polynomials, we deduce that the coefficients \( h_3, h_6, \ldots, h_9 \) are in \( \mathbb{K}[x, y]_{m-1} \). By proposition 3.5, there is no non-zero syzygy in \( \mathbb{K}[x, y]_{m-1} \). Thus we have \( h = 0 \) and every element of \( L(T) \) can be reduced to 0 by the previous relations. In other words, \( \rho_1, \ldots, \rho_8 \) is a generating set of the \( \mathbb{K}[x, y] \)-module \( L(T) \). By theorem 3.6, the relations \( \rho_i \) cannot be dependent over \( \mathbb{K}[x, y] \) and thus form a basis of \( L(T) \). \( \square \)

**3.3. Interpolation.** Our aim is now to compute efficiently a system of generators of \( L(T) \).

More precisely, we are interested in computing the coefficients of \( \sigma_1, \sigma_2, \sigma_4, \sigma_5 \) of \( \rho_1, \rho_2, \rho_3 \). Let us call \( B(x, y) \) the corresponding coefficient matrix, which is of the form:

\[
\begin{pmatrix}
  x^m & y^n & 0 \\
  0 & 0 & x^m \\
  0 & 0 & 0 \\
  0 & 0 & 0
\end{pmatrix} + \mathbb{K}[x, y]_{4,3} \tag{3.11}
\]

Notice that the other coefficients of the relations \( \rho_1, \rho_2, \rho_3 \) correspond to elements in the ideal \( (x^{2m} - 1, y^{2n} - 1) \) and thus can be obtained easily by reduction of the entries of \( \tilde{T}(x, y), x^m, y^n, x^m y^n \cdot B(x, y) \) by the polynomials \( x^{2m} - 1, y^{2n} - 1 \).

Notice also that the relation \( \rho_4 \) can be easily deduced from \( \rho_3 \), since we have \( \rho_4 = x^m \sigma_2 + \sigma_3 + y^n \sigma_4 + \sigma_7 = \rho_4 \). Since the other relations \( \rho_i \) (for \( i > 4 \)) are explicit and independent of \( \tilde{T}(x, y) \), we can easily deduce a basis of \( L(T) \) from the matrix \( B(x, y) \).

As in \( L(T) \cap \mathbb{K}[x, y]_{m-1} \) there is only one element, thus by computing the basis given in proposition 3.7 and reducing it we can obtain this element in \( L(T) \cap \mathbb{K}[x, y]_{m-1} \) which gives us the solution of \( Tu = g \). We can give a fast algorithm to do these two step, but a superfast algorithm is not available.

**4. Conclusions.** We show in this paper a correlation between the solution of a Toeplitz system and the syzygies of polynomials. We generalized this way, and we gave a correlation between the solution of a Toeplitz-block-Toeplitz system and the syzygies of bivariate polynomials. In the univariate case we could exploit this correlation to give a superfast resolution algorithm. The generalization of this technique to the bivariate case is not very clear and it remains an important challenge.
