HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
The Semantics of Eventive Suffixes in French

Fabienne Martin

1. Introduction

Eventive deverbal nouns (henceforth EDNs) can be formed with at least three suffixes in French, namely -age, -ment and -ion. The goal of this paper is to explain the distribution of these three suffixes among EDNs in contemporary French. One possible view is that there is nothing to be explained to begin with. Indeed, one could assume that the distribution of these suffixes cannot be motivated in synchrony, since the nouns in which they enter have often been copied from the Latin ones. Therefore, the argument goes, if the distribution of the suffixes depends on the semantics of the verbal bases, it is on the Latin ones.

However, this “null” hypothesis is not completely satisfactory for several reasons.

The first counter-argument comes from neologisms. Very often, native speakers tend to choose the same suffix(es) to form new nouns from new verbs, and this reflects in corpora. For instance, the verb doper (‘dope’, born in 1903 according to Le Petit Robert) is nominalised more than 800 times in -age, 3 times in -ment, and never in -ion on Internet. This regularity is left unexplained if one assumes that these suffixes do not have a syntax/semantics guiding the nominalising process. Besides, it is not rare that even when a noun formed with a verbal base \( v \) and a suffix \( S_1 \) already exists in French, subjects create another noun with the same base \( v \) and another suffix \( S_2 \). For instance, while indignation already exists, one quite often finds indignement in corpora. One could argue that this kind of neologisms is simply the sign of a certain lexical incompetence, but then, one does not explain why indignage is never created.

The second counter-argument comes from pseudo-nouns. Pseudo-nouns are built on pseudo-verbs, that is invented, meaningless but morpho-phonologically well-formed French verbs. One observes that subjects tend to have intuitions on the semantical differences between pseudo-nouns built on the same base \( v \) with different suffixes \( S_1, S_2, ... \) (Dumay & Martin 2008). Let us take for instance the pseudo-verb toliner. To the question “Imagine that the non-existing verb toliner describes an action. If you want to describe an action of this type which is not finished, would you rather use tolinage or tolination?”, the subjects preferably choose the -age EDN. This kind of intuitions can certainly not be explained if the semantic value of these suffixes is empty.

A third counter-argument comes from the semantical systematicity taking place between EDNs derived from different suffixes. Often, the semantical relation taking place between nouns built with a suffix \( S_1 \) and nouns build with a suffix \( S_2 \) is similar from base to base. For instance, the semantical difference we document below between miaulage\(^3\) and miaulement (from miauler ‘meouw’) is the same as the one between
secouage and secouement (from secouer 'shake'). Again, this cannot be explain if the semantics of these suffixes is supposed to be empty.

The alternative hypothesis explored here is that these suffixes have an abstract semantical value, which contributes to explain:

a) why verbs select different suffixes in the operation of nominalisation, given the additional premisse that the meaning of the verbal stem and the one of the suffix must match
b) the interpretation of existing EDNs, including the semantical differences of two EDNs derived from the same verbal base but with different suffixes
c) the acceptability of neologisms

For this study, two kinds of empirical data have been investigated, namely existing EDNs listed in dictionaries (Le Petit Robert, Le Littré and Le Trésor de la Langue française) as well as existing EDNs which are present in corpora (e.g. on Internet) but not listed in dictionaries. The latter are prefixed with "°".

The paper is divided as follows. Firstly, I introduce a new indicator for the reading of DN under study, namely the eventive one (section 2). Secondly, I present the results of an inquiry on the impact that the aspectual category of the verbal base might have on the choice of the suffixes. Basically, the results are pessimistic: no clear correlation emerges. However, the following sections present data suggesting that other aspectual values of the verbal base play a role here. I address successively the competition between (i) -age and -ment (section 4), (ii) -ment and -ion (section 5) and (iii) -age and -ion (section 6).

2. Selecting the eventive reading of deverbal nouns

For this preliminary study, DN built with different suffixes will only be compared on their eventive reading. I will not try to differentiate the suffixes by the range of readings they are supposed to yield as in Lüdtke (1978), Heinold (2005) or Uth (2008a). The distribution of the suffixes will not be investigated either on the stative or referential readings of DN.

Many – if not all – of the tests which are supposed to diagnose the eventive reading of DN raise serious problems once applied to French. For instance, Roodenburg (2006) shows that contrary to what is predicted by Grismaw’s (1990) analysis, DN can pluralise on their eventive reading in French:

(1) Le général a filmé les désamorçages de bombes lourdes par les recrues.
(Roodenburg, id.)
The general filmed the disarmament of heavy bombs by young soldiers.

Secondly, modifiers like fréquent (‘frequent’) or constant (‘constant’) do not allow to differentiate stative and eventive readings, since they are compatible with nouns clearly denoting states, like maladie or état:
The Semantics of Eventive Suffixes in French

(2) *C'est une maladie constante du projet républicain: il se retourne contre lui-même.*  
(Internet)  
It is a constant illness of the republican project: it turns against itself

(3) *Le bonheur est un état constant.*  
(Internet)  
Happiness is a constant state.

*Progressif* ('progressive') or *graduel* ('gradual') have also been used as diagnostics of eventivity (cf. e.g. Meinschaefer 2005). However, even if these adjectives are indeed possibly incompatible with stative DN's, they also reject DN's like *effarement* ('bemusement') which have an eventive reading, but denote an event which is so quick that it is not easy to emphasize its development, as it is arguably required by these two modifiers, cf. (3).

(3) #L'effarement progressif de Pierre  
The progressive bemusement of Pierre

Given the confusion that might be caused by the use of these tests, I propose to introduce another construction as a diagnostic of eventivity, namely the predicate *assister à* ('to witness'/'to attend'). Contrary to the perception verb *voir* ('see') which imposes much less restrictions on its object, the verb *assister à* robustly rejects objects denoting individuals, states or facts and exclusively selects events:

(4) *J'ai assisté au livre.*  
I witnessed the book.

(5) ??*J'ai assisté au fait qu'il était parti.*  
I witnessed the fact that he was gone.

(6) ??*J'ai assisté à son état.*  
I witnessed his state.

Besides, contrary to *progressif* or *graduel*, it accepts any kind of eventive DN's, including the ones like *effarement* denoting a very short event:

(7) *J'ai assisté à l'effarement de Pierre.*  
I witnessed the bemusement of Pierre.

In line with traditional analyses of perception reports (e.g. Vlach 1983), I will assume that the DN denotes the event which has to be witnessed for the sentence to be true, and only this event. For instance, according to this principle, *soins* ('treatment') only denotes the action of the doctor, cf. (8), while *guérison* ('curing') only denotes the change of state of the patient, cf. (9):^4

(8) *J'ai assisté aux soins.*  
I witnessed the treatment.
Fabienne Martin

(9) J'ai assisté à la guérison.
I witnessed the curing.

If we assume, besides, that modifiers are predicates of the event denoted by the DN, we generally point to the same conclusion with regard to the denotation of the DN. For instance, for (10) to be true, the action of the doctor only has to be quick (the curing itself can be slow), and for (11) to be true, the change of state of the Patient only has to verify this property (the treatment itself can be slow):

(10) Des soins rapides ont eu lieu.
A quick treatment occurred.
(11) Une guérison rapide a eu lieu.
A quick curing occurred.

In the next section, I show that there is no clear correlation between the distribution of the suffixes in EDNs and the (a)telicity of it verbal base.

3. No impact of the (a)telicity of the verb on the choice of the suffix

A robust difference between eventive suffixes under study is that they do not manifest the same preferences for determiners. For instance, while mass DPs built with du, de la or des (French equivalents of bare nouns) are very frequent with -age, they are comparatively much less common with -ment:

(12) C'est du déchiffage. (434 occurrences on Internet)
It is ‘du’ deciphering.
(13) C'est du déchiffrement. (2 occurrences on Internet)
(14) C'est ‘du’ gribouillage (930 occurrences on Internet)
It is ‘du’ scribbling.
(15) C'est du gribouillement. (0 occurrence on Internet)
It is ‘du’ scribbling.

This fact certainly underlies the intuition that -age EDNs are “more massive”. Let us combine this observation with an old hypothesis of Mourelatos (1978), namely that count nouns are derived from telic verbs, while mass nouns are derived from atelic ones. The prediction which naturally follows from this combination is that the (a)telicity of the verbal base may partly play a role in the choice of the suffix. For instance, if Mourelatos is right, given that -age DNs are more frequent with mass nouns, we would expect that -age DNs will preferably be derived from atelic verbs.

To check whether the (a)telicity of the verb can indeed partly drive the choice of the eventive suffix, I tested 300 causative psychological verbs with regard to this aspectual value. For this test, I always selected the same kind of object, namely a bounded one ([+SQA] in the terminology of Verkuyl 1972). For instance, according to
**The Semantics of Eventive Suffixes in French**

the traditional adverbial tests, *embêter* ('to tease') has the atelic reading only, cf. (16), while *séduire* ('to seduce') has an atelic or a telic reading, cf. (17):

(16)  
*J'ai embêté Pierre #en dix minutes/pendant dix minutes.*  
I teased Pierre in ten minutes/for ten minutes

(17)  
*J'ai séduit Pierre en dix minutes/pendant dix minutes.*  
I seduced Pierre in ten minutes/for ten minutes

To each of these verbs were associated

a)  The existent DN(s) (e.g. *emballement* 'enthusiasm' for the psych-verb *emballer*, 'to thrill')

b)  The available (telic and/or atelic) reading(s) (tested with a [+SQA] object)

c)  The other meaning(s) this verb might have (e.g. the physical verb *emballer* 'to wrap' was linked to the psych-verb *emballer*) and, again, the available telic/atelic reading for this new sense

d)  The available DN(s) for the other sense(s) (e.g. *emballage* 'wrapping' was linked to the physical verb *emballer*)

The results of the inquiry are summarised in Table 1 (a fourth suffix –*erie* was also taken into account for the inquiry). The results for atelic and telic readings are given because for some verbs, none of the two is acceptable. The number of DNs containing a certain suffix is put in parenthesis. For instance, the second column indicates that out of 194 DNs in -ment, 95 (ie 48,2%) are derived from verbs which have a telic reading, and 139 (70,5%) are derived from verbs which have an atelic reading (remember that some verbs have a telic and an atelic reading). Note finally that as the same verb may have different aspectual value on its different readings, the DN is counted twice if it nominalises two different readings.

<table>
<thead>
<tr>
<th></th>
<th>-ment (194)</th>
<th>-ion (146)</th>
<th>-age (49)</th>
<th>-erie (16)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Telic r. of the verb OK</td>
<td>48,2%(95)</td>
<td>56,8%(83)</td>
<td>59,1%(29)</td>
<td>31,2%(5)</td>
</tr>
<tr>
<td>Atelic r. of the verb OK</td>
<td>70,5%(139)</td>
<td>71,6%(104)</td>
<td>77,5%(39)</td>
<td>93,7%(15)</td>
</tr>
<tr>
<td>No telic r. for the verb</td>
<td>50,2%(99)</td>
<td>41%(60)</td>
<td>36,7%(18)</td>
<td>62,5%(10)</td>
</tr>
<tr>
<td>No atelic r. for the verb</td>
<td>23,8%(47)</td>
<td>21,9%(32)</td>
<td>18,3%(9)</td>
<td>6,2%(1)</td>
</tr>
</tbody>
</table>

As one can see, no clear correlation emerges between the choice of the suffixes and the aspectual value of the verbal base. The results then indirectly falsify the Mourelatos hypothesis. The -*erie* suffix is the only one to exhibit a clearly different pattern, but the number of corresponding nominalisations is so low that some cautiousness seems in order here. Note that according to A. Fabregas (p.c.), the (a)telicity of the verbal stem seems irrelevant for the choice of the suffix in Spanish too.
These negative results are not very surprising in view of the fact that quite a few verbs have inverse aspectual values under two different readings, but nominalise the same way:

(18) L'éponge a absorbé la flaque en/??pendant dix minutes. (>absorption)
The sponge absorbed the puddle in/for ten minutes.
(19) Pierre m'a absorbé ??en/pendant dix minutes. (>absorption)
Pierre absorbed me in/for ten minutes.

However, we will see in the following sections that other aspectual values of the verbal stem play a role in the distribution of suffixes. 

4. -age versus -ment

4.1 Two previous claims

Two previous claims have been made about the rivalry between the suffixes -age and -ment. According to Dubois (1962) and Dubois & Dubois-Charlier (1999), -age is selected by transitive verbs, and -ment by intransitive ones. Verbs like siffler ('whistle', 'blow') or froisser ('crease') confirm this generalisation, since they nominalise with -age on their transitive reading and with -ment on their intransitive one:

(20) L'arbitre a sifflé le joueur. > Le sifflage/#le sifflement du joueur par l'arbitre
The referee blow the player. The blowing of the player by the referee

(21) Pierre siffle en travaillant. > Le sifflement/#le sifflage de Pierre
Pierre whistled while working The whistling of Pierre

(22) J'ai froissé ma jupe. > Le froissage de la jupe
I creased my skirt. The creasing of my skirt

However, this rule also suffers counter-examples. Firstly, some transitive verbs can nominalise in -ment, cf. (23):

(23) J'ai froissé ma jupe. > Le froissement de la jupe
I creased my skirt. The creasing of my skirt

Sometimes, they even must do so. For instance, on its psychological transitive reading, froisser 'offend/bruise' cannot nominalise in -age, but only in -ment. Secondly, some intransitive verbs cannot nominalise in -ment (cf. arriver, 'to arrive' > arrivage, 'arrival/delivery'; ??arrivement does not exist anymore) or select both suffixes (cf. miauler, 'to meow' > 'miaulage, mialement 'meowing').

Kelling (2001, 2004) admits that -ment can be selected by transitive verbs. However, according to her, the two suffixes still differ then in that -age is supposed to be
selected when the subject of the transitive verb is a prototypical agent according to Dowty (1991)'s proto-agent properties, while -ment is selected in other cases:

\[(24) \quad x \text{ a gonflé } y \]
\[x \text{ inflated } y\]

If \(x\) is an Agent: > \(le \ gonflage \ de \ y\)
The inflating of \(y\)

If \(x\) is not an Agent: > \(le \ gonflement \ de \ y\)
The inflating of \(y\)

But this generalisation also suffers counter-examples. As already noted by Heinold (2005), transitive verbs can nominalise in -ment even when the context indicates that the subject is clearly agentive. In fact, I would add that they even sometimes prefer -ment to -age, as in this example:10

\[(25) \quad Le \ gonflement/?le \ gonflage \ des \ chiffres \ par \ certaines \ sociétés. \ (Heinold, \ id.) \]

The inflating of figures by certain companies

4.2 A multi-feature analysis

Given these counter-examples to the two previous claims, I will here admit that in principle, -ment and -age can both nominalise transitive or intransitive verbs. But the preferences observed by the authors are certainly correct, and should be captured by the analysis as well as their exceptions. However, these exceptions also suggest that it is hopeless to try to capture the difference between two kinds of nominalisations by one feature only.

In what follows, I distinguish -ment and corresponding -age EDNs by four properties \(P_1, P_2, P_3\) and \(P_4\). In the paradigmatical case (arguably the one targeted by previous authors), the two competing nouns derived from the same base differ from each other by each of these four properties. However, in some cases, the verbal base itself “neutralises” some of these properties, because its semantics does not allow to exploit it (see below). In this case, the other properties still allow to differentiate the two competing EDNs.

This analysis presupposes a more fine-grained classification of verbal bases than in previous work, because one should be able to identify the “active” or “neutralised” properties in the nominalisation process. In sum, the relevant properties concern (i) the length of the denoted eventive chain (section 4.2.1), (ii) the degree of agentivity of the subject (section 4.2.2), (iii) the incremental relation between the event and the Theme (section 4.2.3), and (iv) the ontological domain to which the denoted eventive chain pertains (section 4.2.4).

4.2.1 Property \(P_1\): length of the eventive chain
The first relevant property concerns the mereological relation between the two events \( e_{\text{ment}} \) and \( e_{\text{age}} \) respectively denoted by an -ment EDN and the corresponding -age EDN. This property is ‘active’ with verbal bases which present a certain type of semantical underspecification, namely bases which can denote longer or shorter eventive chains. Firstly, this is the case of verbal bases of which are derived verbs enduring the causative/inchoative alternation. At least, these bases are assumed to be underspecified in the “Y-model” proposed by Piñón (2001a), where both the transitive and intransitive version of causative/inchoative verbs are derived from a same (underspecified) base, itself being derived from the adjective. Piñón offers a lot of cross-linguistical empirical arguments showing that this model is to be preferred to the alternative ones, where the causative verb is supposed to be derived from the inchoative one (traditional model), or the inchoative one from the causative one (Levin & Rappaport 1994’s model).

Secondly, it is also the case of bases from which are derived transitive (ex: *shake*) or intransitive (ex: *meouw*) verbs which can either denote a single event or an iteration of it.

I propose that with underspecified bases of this kind, -age selects the longer reading, while -ment selects the shorter one.\(^{11}\) Basically, with these bases, \( e_{\text{ment}} \) is always a (proper) subpart of \( e_{\text{age}} \) (\( e_{\text{age}} \supset e_{\text{ment}} \)). Let us first examine the case of causative/inchoative bases.

**Causative/inchoative verbal bases.** With verbs enduring the causative/inchoative alternation, the witness test presented above allows to show that while -age EDNs denote the full causation, the corresponding -ment ones denote the change of state of the object only:

\[(26) \quad \text{Pierre a assisté au gonflage des ballons.} \]
\(\text{Pierre witnessed the inflating of the balloons.} \)
\(\text{>Pierre witnessed the whole causation} \)

\[(27) \quad \text{Pierre a assisté au gonflement des ballons.} \]
\(\text{Pierre witnessed the inflation of the balloons.} \)
\(\text{>Pierre witnessed the change of state only} \)

\( e_{\text{ment}} \) is then clearly a subpart of the corresponding \( e_{\text{age}} \). Recall however that as already noted above (cf. (25)), -ment EDNs can be used with a *par*-phrase denoting the Agent. In this case, the whole causation must be denoted by the Noun Phrase, exactly as with -age EDNs. This is confirmed by the witness test; while in (27), Pierre only witnessed the change of state, in (28), he has to attend the whole causation:

\[(28) \quad \text{Pierre a assisté au gonflement des ballons par X.} \]
\(\text{Pierre witnessed the inflation of the balloons by X.} \)
\(\text{>Pierre witnessed the whole causation} \)
The Semantics of Eventive Suffixes in French

However, even if (26) and (28) have the same truth conditions, they can still differ compositionally. While in (26), the deverbal noun itself is responsible for the denotation of the causing event, in (28), the interpretation of this event results from the composition of the deverbal noun denoting a change of state with the by-phrase denoting an Agent of an event causing this change of state. As the by-phrase is responsible for the interpretation of the causing event, this event does not have to be interpreted in absence of this adjunct PP.

The fact that with these verbal bases, -age EDNs target the causative reading of the base while -ment EDNs select the inchoative one accounts for the previously noticed preference of -age EDNs (vs -ment ones) for transitive verbs (vs intransitive ones).

Verbal bases with an iterative/non-iterative reading. With intransitive verbs like miauler (‘meouw’) and transitive ones like secouer (‘shake’), the verbal stem can also denote a longer or shorter event in the sense they can denote a single event or an iteration of it. And again, with these bases, -age EDNs select the longer reading (the iterative one), while -ment ones select the shorter one (the single-event one). For instance, while miaulement and secouement denote only one production of sound/one movement, *miaulage or secouage entail an iteration of them. So again, the relation $e_{age} \supset e_{ment}$ is verified, although in a different way. In favour of this analysis, note that when headed by a noun like session which selects the iterative reading, the -ment EDNs must bear the plural morphology, which is not the case of the -age ones:

(29) Une session de miaulage/secouage
A shaking/meouwing session

(30) *Une session de miaulement/secouement
A shaking/meouwing session

(31) Une session de miaulements/secouements
A shaking/meouwing session

Besides, subjects tend to find (32) more natural than (33):

(32) Plusieurs miaulements (secouements) font ensemble un miaulage (secouage).
Several meow-ments (shake-ment) make together a meow-age (shake-age).

(33) *Plusieurs miaulages (secouages) font ensemble un miaulement (secouement).
Several meow-ages (shake-ages) make together a meow-ment (shake-ment).

The idea that -age has an iterative value with some verbs is not entirely new. It was already proposed by Bally (1965). For Old French, Uth (2007, 2008b) argues that non-eventive -age nouns (more precisely nouns denoting a non-eventive entity) systematically denote groups or kinds (which are necessarily instantiated by non-singular entity, cf. Chierchia 1998). This suggests that -age has this iterative value in eventive and non-eventive nouns.
Verbal bases neutralising \( P_1 \). As already mentioned, a property differenting two competing EDNs can be neutralised with some verbal bases. We will show here that \( P_1 \) is neutralised with verbs having a transitive and an intransitive reading (henceforth TIVs), but without enduring the causative/inchoative or iterative/non-iterative alternations. This is for instance the case of pousser.

Recall that among TIVs, most of them, like gonfler ('inflate') display the causative/inchoative alternation, ie entail a causation on their transitive use, cf. (34), and a change of state on their intransitive one. However, verbs like pousser 'push' or tirer 'pull' are not causative on their transitive use. They only entail an event performed by the subject, but no change of state, cf. (35) (cf. Jackendoff 1990 on push, Stein 2007 on pousser):

(34) \[ J'ai \ gonflé \ le \ ballon, \ #mais \ il \ n'a \ pas \ gonflé. \]
I inflated the balloon, but it didn't inflate.

(35) \[ J'ai \ poussé \ la \ voiture, \ OK \ mais \ elle \ n'a \ pas \ bougé. \ (Stein 2007) \]
I pushed the car, but it didn't move.

It would be weird to assume that on one of its reading, the verbal stem of these verbs denotes a change of state \( e' \), since the verb itself does not entail it. In fact, it is more natural to assume that contrary to gonfl-stems, pouss-stems univocally denote the event \( e \) performed by the subject \( x \), and never the change of state \( e' \) (possibly) endured by \( y \). Then, once combined with -ment, the resulting EDN corresponds naturally to the event \( e' \) involving \( x \). Poussement is indeed defined as the “action of pousser” in the dictionary Le Littré. As we just saw, this interpretation is available with gonfler-verbs when a par-

phrase is implicated only:

(36) \[ J'ai \ assisté \ au \ poussement. \]
\( > \)the event involving \( x \) must be seen

(37) \[ J'ai \ assisté \ au \ gonflement. \]
\( > \)the event involving \( x \) can be seen

Given the fact that with pousser-verbs, bases do not exhibit the relevant underspecification (they do not have a “shorter” or “longer” reading), the -age DNks do not denote a longer event as the corresponding -ment ones as in the previous case. The property \( P_1 \) is then “neutralised”. -ment EDNs denote the same kind of eventive chain than corresponding -age ones.\(^{13}\)

4.2.2 Property \( P_2 \): agentivity

In the previous section, I show that -age and -ment EDNs can differ by the length of the denoted eventive chain. I will now address one of the other features differentiating the two suffixes, including when the first one is neutralised, as for pousser-verbs.
The first of them concerns the thematic role of the subject. As already suggested by Kelling (2001, 2004), -age EDNs are more agentive than -ment ones. My claim goes in the same direction, but differs from hers on three points. Firstly, I will assume that while -age EDNs must be agentive, -ment ones tolerate this reading without imposing it. This first claim is illustrated by the contrast above:

(39)  
**Le décollement des tuiles par le vent/ par l'ouvrier**  
The unsticking/removal of the tiles by the wind/by the worker

(40)  
**Le décollage des tuiles par #le vent/ par l'ouvrier**  
The unsticking/removing of the tiles by the wind/by the worker

For instance, native speakers accept the -age version in (40) only in a context where a fictive intention is attributed to the wind.

Secondly, I will not assume with Kelling that EDNs select -age when the first argument of the verbal base is a prototypical agent. This would impede us to explain why some unaccusative verbs like *arriver* nominalise in -age. I will assume that -age EDNs are “agentive” in the following way: *the eventive chain denoted by an -age EDN must begin with an action, or must have been triggered by an action (not denoted by the noun itself)*. So in two words, -age requires the occurrence of an action, either inside the denoted eventive chain, or outside it. With verbs like *décoller* (cf. (40)) or *miauler*, this constraint is very simply translated in identifying the event denoted by the EDN itself with the required action. For instance, it explains why (41) is only accepted by native speakers in a magical context where doors intentionally make noise:

(41)  
**Le miaulement/#miaulage d'une porte qui grince**  
The meowing of a squealing door

In the same way, *poussage* differs from *poussement* in that it suggests that *x* is a real Agent. This explains why *poussage* is often used to describe a (shipping) technique, as this technique 'intrinsically' implies an Agent endowed with intention, while *poussement* is preferred to nominalise the normally non-intentional process denoted by the intransitive reading translated with *grow* in English:

(42)  
**La dent pousse.**  
The tooth is growing.  
> **le poussement/#poussage de la dent**  
> the growing of the tooth

But sometimes, the intransitive *pousser* can also be used agentively in the relevant sense:

(43)  
**Poussage de poils** [title of a mail in a forum]. *Svp, comment faire pour que les poils poussent sur le torse?* (Internet)  
Growing of hair. Please, how to proceed for hair to grow on the chest?
Crucially, (43) does not require a personification of the hair to be acceptable. Rather, the choice of *-age is here justified by the (non default) context where the hair growing process (denoted by the noun) is intentionally triggered upstream through an action. This action is *not* denoted by the noun; as is confirmed by the witness test, cf. (44), but also by the fact that these EDNs nominalising the intransitive reading do not accept a *par*-phrase, cf. (45). This incompatibility is unexpected if the noun itself denotes the action performed by the referent of the *par*-phrase.

(44) *J'ai assisté au pousage de ses poils.
I witnessed the growing of his hair.

I do not necessarily witnessed the action causing the growing event

(45) *Le pousage des poils par X
The growing of the hair by X

The same way, (41) could also be appropriate in a context where somebody plays with the door in order to provoke its meowing squealing. And again, the witness test and the distribution of the *by*-phrase suggests that this action cannot be denoted by the noun itself.

The *-age EDN derived from the intrantive verb *arriver* must also be agentive in our sense. Indeed, contrary to *arrivée*, *arrivage* is “agentive” in that it implies that the change of state e’ denoted by *arriver* is caused by an action e (not denoted by the noun). This is the reason why (47) is weird on the *-age version: contrary to normal assumptions, it suggests that the arrival of meteorites was caused by an action.

(46) *L'arrivée/arrivage de légumes
The arrival of vegetables

(47) *L'arrivée/arrivage de météorites
The arrival of meteorites

However, according to the witness test, *arrivage* only denotes a change of state e’, just as *gonflement*:

(48) *J'ai assisté à l'arrivage des légumes.
I witnessed the arrival of vegetables.

I witnessed the change of state only

Besides, data show that the Agent of the action e who must have caused e’ cannot be expressed by a *par*-phrase:

(49) *L'arrivage des légumes par les ouvriers
The arrival of vegetables by the workers
The Semantics of Eventive Suffixes in French

In conclusion, -age EDNs are more agentive than -ment EDNs not because they impose the role Agent to the subject, but because they systematically signal the existence of an (intentional) action, either at the beginning of the denoted eventive chain, or upstream.

4.2.3 Property $P_3$: incrementality

An interesting fact which cannot be accounted for by $P_1$ and $P_2$ is illustrated by the contrast below, where two different senses of the same verb are used:

(50) Marie a intentionnellement plissé sa jupe.  >  Le plissement/plissage de la jupe

Marie intentionally pleated her skirt.

(51) Marie a intentionnellement plissé les yeux.  >  Le plissement/\#plissage des yeux

Marie intentionally squinted her eyes.

If only $P_1$ and $P_2$ are taken into account, plissage is expected to nominalise (51) as well as (50) (in both cases, the causative reading is selected, and the adverb intentionally signals the presence of an intentional action). The contrast (50)–(51) is due to the third relevant property $P_3$, which has to do with the relation taking place between the denoted event and its Theme. More precisely, the hypothesis is that for -age to be acceptable, a (loose) incremental relation has to be conceivable between the event $e$ and the Theme $x$: for every (relevant) proper part $y$ of the Theme $x$, $y$ stands in the relation $\theta$ denoted by the verb to some proper part $e'$ of $e$ (cf. the property (46) of Krifka 1998, called mapping to subevents). This relation can easily be satisfied in (50) (every (relevant) part of the skirt can be the Theme of a pleating subevent), but not in (51) (it does not make sense to say that every (relevant) part of the eyes is the Theme of a squinting subevent).$^{14}$

Note that $P_3$ is neutralised with Themeless verbs like unergative ones, since these cannot be concerned by the Theme-event relation.

$P_3$ also accounts for the contrast between (53) (perfectly normal) and (54) (which is very scabrous, even when the intention to injure is taken for granted):

(52) Pierre a écrasé la banane/le piéton

Pierre crushed the banana/ran over the pedestrian.

(53) L’écrasage de la banane

The crushing of the banana

(54) #L’écrasage du piéton

The running over of the pedestrian

(55) OK L’écrasement du piéton
The running over of the pedestrian

If (54) is scabrous, it is because in order to fulfill $P_3$, the interpreter has to evoke a scene where to different parts of the subject's action corresponds different parts of the pedestrian, ending up with a bloody scenario. $P_3$ also accounts for the fact that sometimes, -age EDNs are better with a plural Theme. Indeed, a Theme made of a plurality of entities is an alternative way to satisfy the incremental relation when it cannot be fulfilled with one entity only.\(^{15}\)

(56) *Le tuage des mouches*
The kill-age of the flies

(57) *#Le tuage de la mouche*
The kill-age of the fly

(58) *L'arrivage des légumes/#d'un légume*
The arriv-age of the vegetables/of one vegetable

(59) OK *L'arrivée d'un légume*
The arrival of one vegetable

4.2.4 Property $P_4$: ontological domains

The last property driving the competition between -ment and -age concerns the ontological domain to which pertains the denoted eventive chain. The proposed hypothesis is that -age is marked for a specific domain, namely the physical one, while -ment is ontologically unmarked.

A first prediction of this hypothesis is that -age will not be selected by verbs which do not have a physical reading. This is the case of a subset of psych-verbs, like penser 'think', préoccuper 'preoccupy', effrayer 'to frighten', or imaginer 'imagine'. And indeed, the -age EDNs of these verbs appear odd to native speakers (cf. ??pensage, ??préoccupage, ??effrayage, ??imaginage). However, one finds from time to time occurrences of them, but they seem to involve a metaphor: the psychological interaction is depicted as a physical one. For instance, effrayage is slightly present in corpora, but it denotes the (physical) event by which one triggers fear on the Experiencer (and, as expected given $P_2$, this causing event is conceived as an intentional action).

Another prediction of the hypothesis is that when the base is underspecified wrt to the ontological domain of the denoted event (like gonfler 'inflat', which can denote a physical event or an abstract one depending on the nature of the Theme), -age will select the physical reading, and -ment the other ones. This is indeed the case, cf. (60). And again, when an abstract event is denoted with the help of an -age EDNs as in (61), a metaphor seems to be involved in the interpretation:

(60) *Le gonflément des prix/ le gonflage du ballon*
The inflating of the prices [abstract Theme]/ the inflating of the balloon [physical Theme]
The Semantics of Eventive Suffixes in French

(61)  *Le gonflage des prix* (metaphorical)
The inflating of the prices

$P_2$ is less coercitive than properties $P_1$, $P_5$, since it often seems possible to accommodate it with a metaphorical reading.

5.  *-ment versus -ion*

This section is dedicated to the differences between the suffixes *-ment* and *-ion*. The competition between these two suffixes represents a much more difficult area than the previous one, maybe because *-ion* and *-ment* are supposed to be quite unproductive in modern French -- although not totally, while *-age* is very productive, cf. Heinold (2007). Indeed, the relative difficulty to create neologisms in *-ion* and *-ment* obliges to play with verbs who actually have the two nominalisations.

Dubois 1962 assumes that *-ment* and *-ion* are synonymous and come from the same syntactical structures. He only notes that two competing nominalisations select different readings of the same verb, the *-ion* ones being “more technical or more recent” (id., p.28). In what follows, I will show that there are more systematical differences between *-ion* and *-ment* than suggested in previous literature.

5.1 Property $P_1$: length of the eventive chain

Roughly, as far as $P_1$ is concerned, there seem to exist some similarities between *-age* and *-ion* in the way they compete with *-ment*.17

Firstly, with bases of causative/inchoative verbs, *-ion* EDNs tend to be underspecified: they can target either the 'longer' or the 'shorter' reading (while, as we saw before, *-ment* selects the shorter one). More precisely, *-ion* can either denote the whole causation, or the change of state only, while *-ment* denotes the change of state, but not the whole causation.18 This is illustrated here:

(62)  *L'isolement de la maison*
The house’s isolation
   i. the isolated (change of) state of the house
   ii. #the action of isolating the house

(63)  *L'isolation de la maison*
The house’s isolation
   i. the isolated (change of) state of the house
   ii. the action of isolating the house

(64)  *Le dénarement de la presse*
The denaturation of the press
   i. the press alters by itself
   ii. #an external event triggers the alteration19
(65)  *La dénaturation de la presse*

  The denaturation of the press

  i. the press alters by itself
  ii. an external event triggers the alteration

With some alternating bases, -ion EDNs only access the long reading. This confirms that -ion is more 'causation' oriented while -ment is more 'result'-oriented. For instance, *finition* 'finishing' cannot denote the change of state only, and must denote an event triggering it upstream. This explains the unacceptability in (67b), since the ending of the autumn cannot be caused by an event of which it would be the Theme.

(66)  *Le finissement de l'automne*

  The ending of the autumn.

(67)  a.  *La finition du poème*

     The finishing of the poem

  b.  *#La finition de l'automne*

     The finishing of the autumn

(68)  *La voiture s'est déportée sur la gauche.* (inchoative reading)

  The car swerved to the left.

(69)  *Le département/#la déportation de la voiture*

  The swerving of the car

(70)  *Les Nazis ont déporté des millions de Juifs.* (causative reading)

  Nazis sent millions of Jews in concentration camps.

(71)  *Le #département#la déportation des Juifs*

  The deportation of the Jews

As with causative/inchoative bases, -ment EDNs tend to denote the change of state only, it is harder to adjunct them a par-object than with -ion EDNs:

(72)  *L'oppression/l'excitation des enfants par Paul*

  The oppression/excitation of the children by Paul

(73)  *L'opressement/l'excitement des enfants #par Paul*

  The oppressment/excitement of the children by Paul

Causative bases without inchoative readings (ie, obliged to denote the entire causation on all their uses) also confirm that -ion denotes longer eventive chains than -ment. Indeed, such bases have more difficulty to combine with -ment than with -ion. On the other hand, -ment neologisms are not rare with causative verbal bases having an inchoative reading (if the -ment noun does not already exist in the lexicon). This can be illustrated through a difference between two types of causative psych-verbs, namely *indigner*-verbs (which have an inchoative reading, cf. (75)–(76) below), and *séduire*-ones (which do not exhibit the inchoative reading, cf. (77)–(78)). With *séduire*-verbs, the
pronoun se is always interpreted as a reflexive pronoun (while the interpretation of se with the inchoative reading is of course not reflexive):

(75) a. Paul s’est indigné.
   i. Paul got indignant. (inchoative reading)\(^{\text{20}}\)
   ii. Paul did something which made him indignant. (causative reading)

b. Indignation (listed in dictionaries), \(^{\text{\circ}}\)indignement (184 occ. in corpora)

(76) a. Paul s’est irrité de ma réponse. (inchoative r.) Paul s’est irrité lui-même.
   (causative r.)
   Paul got angry about my answer. / Paul irritated himself.

b. Irritation (listed in dictionaries), \(^{\text{\circ}}\)irritement (133 occ. in corpora)

(77) a. Paul s’est séduit.
   i. Paul seduced himself (causative reading)
   ii. no inchoative reading

b. Sédution, \(^{\text{\circ}}\)séduisement (0 occ. in corpora)\(^{\text{21}}\)

(78) a. Paul s’est humilié.
   i. Paul humiliated himself (causative reading)
   ii. no inchoative reading

b. Humiliation, \(^{\text{\circ}}\)humillement (2 occ. in corpora)\(^{\text{22}}\)

Note that the Latin suffix -tio was already more ‘causative’ than the Latin suffix -ment(tum). The following pairs taken from Gaffiot (1934) shows that -io nominalisations tend to denote the causation or the result of it, while -ment(tum) corresponding ones denote either the result of the action or one of its reifications:\(^{\text{23}}\)

(79) a. motio, -onis: action of moving, movement, impulsion
   b. momentum (movimentum): movement, impulsion

(80) a. fractio, -onis: action of breaking
   b. fragmen: fragment, broken pieces

(81) a. argutio, -onis: action of blaming
   b. argumentum: argument, evidence

As for intransitive verbs denoting a single event or an iteration of it, \(P_1\) does not seem to play any role in the competition between -ment and -ion. Sometimes, -ion seems to target either the short or the long reading, while -ment selects only the short one (for instance, it is more natural to conceive a suffocation as an iteration of suffoquements than the reverse). But this does not seem to be a general tendency, and the plural/singular morphology does not reflect this intuition (one cannot replicate for the -ment/ion pair the kind of contrasts (32)-(33) obtained for -ment/age). Besides, \(P_1\) does not make any prediction about intransitive verbs which do not have an iterative and a non-iterative reading, nor about causative verbs which systematically denote the whole causation (i.e. without a inchoative reading) and for which the nominalisation in -ment and in -ion are
both available in the lexicon. Indeed, as with such verbs, any nominalisation denotes the whole causation, one cannot say anymore that -ion ones only target the long reading.

5.2 Property P₄: ontological domains

However, other features allow to differentiate the two suffixes with all these classes of verbs. Very often, when comparing semantically their -ment EDN and the corresponding -ion one, one finds that the latter one roughly corresponds to the first one, but augmented with adjuncts specifying further some properties of the process:

(82) a. agenouillement: action of kneeling or its result (TLF)
    b. génuflexion: action of kneeling in sign of respect or submission (id.)

(83) a. crucifiement: action of crucifying (Le Petit Robert)
    b. crucifixion: “crucifiement de Jésus-Christ” (id.), ie “crucifixion of Jesus-Christ”

The same way, a 'renonciation' could be defined as a 'renoncement' made public (which explains why one can sign a renonciation, but not a renoncement, or why déclaration de renonciation is fine, while déclaration de renoncement is strange).

Very often, the specification carried out by -ion triggers a change in the ontological domain to which pertains the denoted event: while an agenouillement can be a simple physical event, génuflexion compulsorily denotes a social, ethical event. Of course, the target domain can vary from nouns to nouns, but in many cases, -ion transfers the event denoted by the corresponding -ment noun in an abstract domain.

Note that there is a common point behind the properties P₁ and P₄ in the way they differentiate the two suffixes, namely that in both cases, -ion has a richer, more complex meaning than the corresponding -ment one.

5.3 P₅: discontinuity

Another intuition about the difference between -ment and -ion is that -ion is more 'prototypically telic' than -ment. Firstly, note in table 1 above that even if -ment take bases of verbs having a telic reading, it is less often the case than -ion (46% versus 57%). Secondly, the bases selected by -ion resemble more the prototypical accomplishments (the 'eat a sandwich' Vps) than the ones selected by -ment. Indeed, with verbs denoting an event e₁ and a change of state e₂, -ion EDNs seem to require that the event e₁ can be conceived as performed in several discontinuous steps e₁', e₁'', e₁'''...(subevent/subresult, pause, subevent/subresult, pause...). I will assume that the verb satisfies this requirement when it can be modified by en plusieurs étapes 'in several steps'. On the contrary, -ment seems to preferably select bases denoting an event conceived by default as taking place without interruption. This difference is illustrated below:

(84) a. J'ai éclaté le ballon #en plusieurs étapes.
The Semantics of Eventive Suffixes in French

I exploded the balloon in several steps.

b. éclatement/*éclatation

(85)  a. Samira a alphabétisé Pierre en plusieurs étapes.
    Samira alphabetised Pierre in several steps.

b. alphabétisation/*alphabétisement

(86)  a. Il m'a étonné/affolé #en plusieurs étapes.
    He astonished/threw me into panic in several steps.

b. étonnement, affolement/*étonnation, *affolation

(87)  a. Il m'a séduit/humilié en plusieurs étapes.
    He seduced/humiliated me in several steps.

b. séduction, humiliation/ *séduisement, *humillement

There are counter-examples to this correlation (for instance, gonfler is acceptable with en plusieurs étapes but cannot nominalise in -ion), but until now, I found more nouns confirming it than the reverse. Dumay & Martin (2008) try to test it through experiments on pseudo-verbs.

6. -age versus -ion

Several predictions about the differences between -age and -ion derive from what has been proposed in the sections 4 and 5. Firstly, we expect -age and -ion to preferably denote events from different ontological domains when attached to the same bases. This is confirmed by the following data:

(88)  a. un cassage de doigt, #une cassation de doigt (physical event)
    a breaking of a finger

b. la cassation d'une décision juridique, #le cassage d'une décision juridique (jur. event)
    the canceling of a juridical decision

(89)  a. le fixage d'un tableau (non metaphorical)
    The fastening of a painting

b. le fixage des prix (metaphorical) vs la fixation des prix (non metaphorical)
    The setting of the prices

Note however that -ion can sporadically denote physical events too. For instance, fixation would be acceptable in (89a) without involving any metaphor (whereas it is not possible in (88a)). But this does not undermine the claim that -age and -ion differ in their preference for specific domains.

Another expected difference is that contrary to -age which always implies the presence of an action (cf. P2), making it difficult to use to denote pure change of state (ie not caused by the action of an entity upstream), -ion can denote such pure changes of state. Take again the verb fixer when it translates the intransitive settle (as said above, this inchoative reading often requires the use of the pronoun se)
Fabienne Martin

(90) a.  
La tribu s'est fixée dans cette région.
The tribe settled in this region.

b.  
La fixation de la tribu # le fixage de la tribu
The settling of the tribe

On this use of fixer, -age cannot be used, except if the speaker wants to signal the existence of an action of which the settling is the result. Dessaler also only nominalises in -ion in its inchoative reading (examples taken from Dubois 1972, p.28):

(91) a.  
On dessale l'eau de mer.  Le dessalage de l'eau de mer
We remove the salt from seawater. The removing of the salt from seawater

b.  
L'équipage du canoé a dessalé. La dessalaison # le dessalage de l'équipage
The crew of the canoe capsized. The capsizing of the crew

The same way, (92), but not (93), automatically suggests the existence of an action upstream triggering the Theme's change of state (which makes e.g. the earth version of (92b) odd, except if we admit that the Earth's glaciation was triggered by a divine action).

(92) a.  
Le dispersage des cendres (no 'by themselves' reading)
The dispersion of the ashes

b.  
Le glaçage du gâteau # le glaçage de la terre
The glazing of the cake/the glaciation of the Earth (intended reading)

c.  
Le perforage du mur # le perforage de l'intestin
The perforation of the wall/the perforation of the intestine.

(93) a.  
La dispersion des cendres (‘by themselves' reading OK)
The dispersion of the ashes

b.  
La glaciation de la terre (‘by itself' reading OK)
The glaciation of the Earth

c.  
La perforation de l'intestin (‘by itself' reading OK)
The perforation of the intestine

Another related prediction from previous claims is that with underspecified causative/inchoative verbal bases, the -age EDNs systematically denote the whole causation, while -ion ones can also denote the change of state only. (92) and (93) can be seen as evidence for this claim too. But it also accounts for the following contrast in (95)–(98), once we assume that the object of aboutir à 'result in' can denote the last part of the eventive chain described by the subject.

(95)  
Le °dispersage des cendres a abouti à leur dispersion.
The ‘dispers-age’ of the ashes resulted in their dispersion.
The Semantics of Eventive Suffixes in French

(96) #La dispersion des cendres a abouti à leur "dispersage."
The dispersion of the ashes resulted in their 'dispers-age'.
(97) Le "désinfectage de la plaie a abouti à sa désinfection."
The 'disinfect-age' of the wound resulted in its disinfection.
(98) #La désinfection de la plaie a abouti à son "désinfectage."
The 'disinfect-age' of the wound resulted in its disinfection.

As expected, (96) and (98) are unappropriate because-age necessarily denotes the whole causation. This forces to end up either with an interpretation where a whole causation C results in itself (if the –ion EDN denotes the whole causation C too), or with an interpretation where the result of a causation C results in the causation C (if the –ion EDN denotes the result only).

A last prediction is that -ion will be ceteris paribus preferred to -age when the incremental relation between the event and the Theme imposed by -age cannot be satisfied (cf. P3). This is supported by the following contrasts:

(99) Le codifiage d’un texte/?d’un nombre
The codifying of a text/of a number
(100) La codification d’un texte/d’un nombre
The codification of a text/a number
(101) Le numérotage d’une rue/?d’une voiture
The numbering of a street/of a car
(102) La numérotation d’une rue/d’une voiture
The numbering of a street/of a car
(103) Le modifiage d’une image/?d’un chiffre
The modifying of an image/of a figure
(104) La modification d’une image/d’un chiffre
The modification of an image/of a figure

7. Conclusions

Table 2 below summarises the differences made in sections 4-6 between the three suffixes under study on their eventive reading.

Table 2: semantical/aspectual differences between the three eventive suffixes under study

21
In sum, I hope to have made clear that these three suffixes are semantically rich and seem to function as aspectual markers similar to verbal ones. However, contrary to verbal markers, nominalising suffixes often give rise to specific lexicalisations and are not equally productive. Hence, the competition between them is harder to modelise, and diachronical factors arguably play a bigger role than suggested here. But clearly, the choice of the suffix in the nominalising process does not only depend on historical accidents, as it is traditionally often assumed.

Notes

I would like to thank Melanie Uth, Nicolas Dumay and the audiences of the Research Seminar Latest Developments in Syntactic and Morphological Theory (Dec. 2007, Stuttgart University) and Formal Semantics in Moscow 4 for discussions, as well as Anna Pazelskaya, Florian Schäfer and the anonymous reviewers for their valuable comments on an earlier version of this paper. I also thank Dennis Spohr for his technical assistance, and Artemis Alexiadou for having invited me to present this work to the aforementioned seminar. This work is part of the project B5 “Polysemy in a conceptual system” of the SFB 732.

1 The searches were made between December 2007 and April 2008.
2 The meaning of the symbol ° will be explained below.
3 Note that assister à does not allow (and is not meant) to distinguish between complex and simple event readings (with and without argument structure), contrary to the tests introduced by Grimshaw (1990). Indeed, (8) and (9) shows that assister à is acceptable with nouns that do not have an argument structure.
4 Brinton (1995) also argues that the (a)telicity of the verbal base is determinant for the choice of the suffix.
5 With a non-bounded object, the yielded VP would invariably be atelic.
6 “Other” meanings should not be interpreted as “derived” or “secondary” meanings. In the case of psych-verbs, the physical reading is of course very often the first one (of which the psychological reading is derived).
7 Note that a finer typology of atelic readings may change the results; for the test, no distinction was made between the case where the durative adverbial scopes over the event and the one where it scopes over the resultant state.
8 Note that we can explain the distribution of the determiners illustrated in (12)-(15) independently of the Mourelatos hypothesis. We could for instance assume with Uth (2008b) that -age functions as a plural operator which produces an atelic iterative reading when applied to a telic verbal base, while -ment functions as an individuator which produces a telic reading when applied to an atelic verbal base. Of course, this line of reasoning gives up the assumption of Mourelatos according to which the aspectual properties of the verbal base directly determine the aspectual properties of the corresponding nominalisation.
9 According to a reviewer, (25) needs not be a counter-argument against Kelling’s claims, because the first argument of the nominalisation may appear to be less proto-agentive than the first argument of gonflage du pneu. I am not convinced by this view, because it is difficult to evaluate to which degree an abstract entity like the one denoted by sociétés satisfies the proto-agent properties (e.g., do they move in an abstract space?)
10 Funnily, at least two of the informants to which I present some of the relevant -ment/-age pairs seem to justify “phonologically” their choice in saying that ““-aaaaaage is longer”. Maybe some iconic effect between semantics and phonology is at play here (either -age has a better phonology to denote longer events, or subjects perceive –age nominals as denoting longer events and try to justify their intuition phonologically).
11 According to A. Fabregas (p.c.), Spanish suffixes also differ from each other on this point: sacudimiento denotes an iteration of shaking (for example, if a house shakes for a while as an effect of an earthquake), and sacudida denotes a single instance of shaking (for example, if a bull hits a car only once, that is a sacudida). As this example already shows, there is no correspondence between the French -ment and the Spanish -miento. See Fabregas (2007) for an analysis of affix rivalry in Spanish.
12 One could wonder what exactly denote pousser-bases and how many of them we have to assume. In fact, it is very likely that pousser-bases invariably denote the performance of x, x corresponding to the subject of the transitive or the intransitive verb. In both readings, this performance can be defined the action of exerting a force in a direction that goes away from x. For instance, the event denoted in (38a) can be described as a pressure performed by Pierre away from Pierre, and the one denoted in (38b) as the pressure exerted by the tooth and away from the tooth:

\[(38)\]

\[
\begin{align*}
\text{a.} & \quad \text{Pierre pousse la table.} \\
& \quad \text{Pierre is pushing the table} \\
\text{b.} & \quad \text{La dent pousse.} \\
& \quad \text{The tooth is growing}
\end{align*}
\]

14 The relation we need is looser than the Krifkean one (cf. Krifka 1998) because it allows the same part y of the Theme x to be the Theme of different subevents e’, e’’...of e. For instance, VP’s like iron the skirt satisfy our incremental relation, even if for some parts e’ and e’’ of the whole ironing e, e’ and e’’ can have the same subpart of the skirt as a Theme (e.g., the same part of the skirt can be ironed twice). In other words, we admit here that an incremental relation takes place between the event and the Theme even if the property (47) of Krifka 1998 (uniqueness of events) is not satisfied.
15 There are some exceptions to this picture though. For instance, poussage used to denote a shipping technique does not seem to require a plural Theme to be acceptable. I do not have an explanation for this.
16 For instance, in a corpus of the newspaper Le Monde extending on several years, Heinold found 65 neologisms in -age, 10 in -ment and 20 in -ion. It should be noted, however, that in less formal corpora, one finds quite often
neologisms in -ment and -ion. Of course, these productions can be analysed as results of lexical incompetence. But then, as already said in the introduction, the question remains of why some neologisms never show up in any corpora.

I should add that some of the native speakers I consulted do not have intuitions about the distinctions made in this sub-section, which seems to suggest, as Dubois (id.) proposes, that -ion and -ment tend to be used as synonyms in modern French. However, some other speakers do recognize them, and we will see that they also receive some diachronical and syntactical support.

It is interesting to see that this hypothesis is confirmed by some dictionaries, but not all. For instance, Le Littré defines dénivelllement (delevelling) as the result of the process denoted by dénivellation (delevelling). But Le Trésor de la Langue française defines dénivelllement as denoting an action.

Note that because of the incrementality constraint imposed by -age (cf. P.), (90b) in the -age version would also require in this agentive context that the Agent acted on different parts of the tribe to get it settled in the region.

Dubois only states that -age and -ion select different readings of the verb. For the same syntactical frame, the only difference he seems to make between -age and -ion is that -ion selects the more technical reading of the verb. This difference does not apply to (91), where the two meanings are equally technical.

Some verbs like dessaler nominalise in -aison and not in -(a)tion, but this suffix -aison is the same as the -ion one under study here.

This is for instance corroborated by the acceptability of a sentence like La vente d’un objet aboutit au transfert de sa propriété 'the selling of an object results in the transfer of its property' (since the property transfer corresponds to the last part of the eventive chain denoted by the selling).
