### Abstract

We investigate whether inclusion and permanence in the Domini social index affects corporate performance on a sample of around 1,000 firms in a 13-year interval by controlling for size, industry, business cycle and time invariant firm idiosyncratic characteristics. Our results find partial support to the hypothesis that corporate social responsibility is a move from the shareholders wealth to a multi-stakeholders welfare target. On the one side, permanence into the Domini index is shown to increase (reduce) significantly total sales per employee (returns on equity but not when large and R&D investing firms are excluded from the sample). On the other side, lower returns on equity for Domini firms seem nonetheless to be accompanied by relatively lower conditional volatility and lower reaction to extreme shocks with respect to the control sample.

An explanation for these findings, suggested by the inspection of Domini criteria, is that social responsibility implies, on the one side, decisions leading to higher cost of labour and of intermediate output, but may, on the other side, enhance involvement, motivation and identification of the workforce with company goals with positive effects on productivity.

**Key words:** social responsibility, stakeholders, corporate performance.

**JEL classification codes:** M14, L21.

---

<sup>1</sup> Paper presented at the XIII Tor Vergata Financial Conference. Support from the *Veritatis Splendor* Research Project on Social responsibility is acknowledged. ## 1. Introduction

A first minimal definition of social responsibility is generally related to the corporate choice of not breaching laws and regulations when pursuing shareholders' wealth maximisation goals. A second approach considers that CSR is more than just following the law (McWilliams & Siegel, 2001), as it also involves actions which are expected to affect positively an identifiable social stakeholder's welfare. Our analysis is aimed at measuring the impact of this second definition of CSR on corporate performance.

The debate on the relevance and effects of this second type of corporate social responsibility is polarised around two opposite perspectives. A first one considers CSR as a violation of manager's mandatory duties, when it materialises into arbitrary management of "free cash flow" and higher expenditures which reduce shareholders' wealth (Friedman, 1962).<sup>2</sup> The reasoning of Friedman (1962) implies an efficient balance of powers between profit maximizing firms and social welfare maximizing institutions, which is far from the reality of our economic systems. Asymmetric information, agency costs and conflicts of interests are so widespread in our imperfect economic environment and institutions are distant from the benevolent planners depicted by theoretical models of some decades ago. All this considered, an important argument for the relevance of CSR comes from the observation that, in a society riddled by conflicts of interests and informational asymmetries, with weak institutions and incomplete contracts, the tenet of shareholders wealth maximization may be socially and environmentally untenable if corporate power is not offset by proper checks and balances from institutional action.

In the current "three-pillar" (institutions, corporations and the civil society) system what we observe are stakeholders creating bottom-up pressures on corporations in order to compensate institutional weaknesses in designing rules which should align firm behaviour to the goal of socially

---

<sup>2</sup> "Few trends could so thoroughly undermine the very foundations of our free society as the acceptance by the corporate officials of a social responsibility other than to make as much money for their shareholders as possible".

1  
2  
3 and environmentally sustainable development (Adriani and Becchetti, 2004). This pressure induces  
4 corporations to signal their social responsibility in order to minimize attrition with stakeholders. In  
5 this framework, CSR often originates not from an autonomous decision of managers, but from  
6 external pressures from consumers or institutions.  
7  
8  
9

10  
11  
12 Well aware of these linkages between corporations, institutions and consumers, a different and  
13 broader view on CSR considers the social role of corporations and their relationship not just with  
14 shareholders, but with the larger set of firm stakeholders. In this perspective Freeman (1984)  
15 emphasizes that, if stakeholders have voice, the socially responsible behaviour of corporations may  
16 be a rational strategy to minimize conflicts and optimize synergies in their complex network of  
17 relationships with various stakeholders (local communities, consumers, environmentalist  
18 associations, subcontractors, etc.).  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28

29 On this line Tirole (2001) argues that the concept of stakeholder value recognizes that corporate  
30 activity may create negative externalities which need to be counterbalanced, either by institutional  
31 rules or by corporations themselves. In such case, creating shareholders value is not enough to  
32 maximize total welfare and management should aim at “*maximizing the sum of various stakeholder*  
33 *surpluses.*” He is though sceptical on the possibility of creating incentives which can induce  
34 managers to behave in a socially responsible way. First, he observes that the difficulty of measuring  
35 SR fosters managerial opportunistic behaviour. Second, he argues that a SR company, by definition,  
36 should shifts its focus from the maximisation of shareholders’ wealth to a multi-stakeholders  
37 welfare approach. The consequence of this move may be a relatively lower return on equity which  
38 may make her object of a takeover from a profit maximising raider.  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51

52 A first reply to Tirole (2001) is that several social labelling organisations have born to overcome  
53 informational asymmetries in this field. Hence, a corporation is nowadays considered as being  
54 socially responsible not just when it claims to be as such, but only if it complies with a set of  
55 externally fixed behavioural criteria. Opportunistic behaviour is obviously always a temptation but  
56  
57  
58  
59  
60

---

(...)If businessmen do have social responsibility other than making maximum profits for stockholders, how are they

1  
2  
3 external monitoring and reputational costs from being caught cheating on SR may be a strong  
4  
5 deterrent. The second Tirole's objection (takeover risk) is an interesting one and is somewhat related  
6  
7 to our empirical research aimed at verifying whether SR firms create relatively more or less  
8  
9 shareholder value than the rest of the economy.  
10  
11

12  
13 Overall, an interesting issue in the above mentioned debate on CSR is that CSR may definitely be a  
14  
15 superior corporate behaviour in terms of social welfare if the expected reduction of negative  
16  
17 externalities is accompanied by a creation of aggregate economic value (and not merely shareholder  
18  
19 return) equal or superior to that of non socially responsible firms. If this is true, a powerful  
20  
21 incentive for corporations to adopt a SR attitude, beyond enlightened altruism, exists. This is why  
22  
23 the evaluation of the effects of SR on corporate performance is a relevant topic in the current  
24  
25 literature on CSR.  
26  
27

28  
29 Our paper focuses on this issue and is divided into seven sections (including introduction and  
30  
31 conclusions). The second section discusses the expected costs and benefits arising from the  
32  
33 adoption of a SR behaviour. The third section briefly surveys the empirical literature on the effects  
34  
35 of SR on corporate performance. The fourth section analyses SR criteria of a widely acknowledged  
36  
37 standard (the Domini index which will be the benchmark of our empirically analysis) focusing in  
38  
39 particular on their potentially cost increasing and productivity enhancing characteristics. The fifth  
40  
41 section presents and comments our descriptive and econometric findings on the impact of entry,  
42  
43 permanence and exit from the Domini index of SR. The sixth section analyses whether the lower  
44  
45 return on equity of SR firms is compensated by reduced conditional volatility of SR firms stock  
46  
47 returns.  
48  
49

---

*to know what it is? Can self private individuals decide what the social interest is ??" (Friedman, 1962)*

1  
2  
3 Before testing directly the impact of SR on corporate performance we briefly survey theoretical  
4 grounds which might support the hypothesis of a non negative relationship between SR and  
5 corporate performance. As a starting point we must consider - as it will be clear from the analysis of  
6 the characteristics of Domini criteria - that SR involves the undertaking of a set of actions which are  
7 potentially cost increasing (such as higher attention to workers conditions within the firm and in  
8 subcontracting companies, adoption of more environmentally, and often more costly, productive  
9 processes, etc.).

10  
11 These sources of additional costs need to be compensated by some potential benefits to be  
12 economically sustainable. A first one, already mentioned, is represented by the creation of  
13 *reputational* capital which may help the company to obtain more favourable terms of trade when  
14 negotiating with various stakeholders (Cornell and Shapiro, 1987; Bowen et al., 1995; Jones, 1995).

15  
16 A second one considers that SR may positively affect workers productivity if we move away from  
17 the standard microeconomic approach which regards labour productivity as solely related to  
18 individual skills, human capital and expected remunerations. In this perspective, a new strand of the  
19 literature starts modelling workers productivity as being affected not just by the usual set of  
20 individual worker variables, but also by intrinsic motivation, coworkers behaviour or working  
21 conditions, and by the workers identification with the goals of their firm (Agell and Lundberg,  
22 1999; Bewley, 1999, Campbell and Kamlani, 1999). Social preferences<sup>3</sup> (Fehr- Schmidt, 1999; Fehr  
23 and Schmidt, 2001; Sobel 2001) and gift exchange models (Akerlof, 1982) are two leading fields in  
24 this literature .

25  
26 In this perspective, it is possible that the move to (exit from) CSR may significantly increase  
27 (reduce) intrinsic workers motivation, thereby affecting positively (negatively) their productivity.

### 3. The empirical literature on the impact of CSR

---

<sup>3</sup> According to a definition of Fehr and Falk (2002) "a person exhibits social preferences if it does not only care about the material resources allocated to it but also cares about the material resources allocated to other relevant reference agents".

5  
6  
7  
8  
9  
10  
11  
12  
13  
14  
A huge number of empirical papers have tested in the past the relationship between social responsibility and corporate performance. Strangely enough, almost all of these papers have been published in the business and not in the economics literature, even though the topic of CSR is obviously relevant for both.

15  
16  
17  
18  
19  
20  
21  
22  
This “anomaly” gives us the advantage of providing an original contribution to this specific field by testing the relationship between the two variables with methodological approaches which are standard in economics, but are not always used in the business literature.

51  
52  
53  
54  
55  
56  
57  
58  
59  
60  
With some approximation we can divide the existing empirical papers into three groups.

The first finds a positive relationship between CSR and corporate performance. Solomon and Hansen (1985) find that the costs of having a high level of CSR are more than compensated by benefits in employee morale and productivity. Pava and Krausz (1996) and Preston and O’Bannon (1997) observe that CSR is positively associated with financial performance, while positive synergies between corporate performance and good stakeholders relationships are found by Stanwick and Stanwick (1998) and by Verschoor (1998). Ruf et al. (2001) find that change in CSR is positively associated with growth in sales and that returns on sales are positively associated with CSR for three financial periods. Simpson and Kohers (2002) document a positive link between social and financial performance on a sample of banking firms.

A second group of papers finds no significant direction in the link between CSR and corporate performance. Mc Williams and Siegel (2001) observe that the financial performance of the Domini index constituents is not significantly different from that of a control sample when per capita R&D expenditure is added among regressors. Other papers finding inconclusive results are those of Anderson and Frankle (1980), Freedman and Jaggi (1986) and Aupperle, Carroll and Hatfield (1985).

A third group of contributions documents a negative relationship between CSR and corporate performance which is consistent with the managerial opportunism hypothesis. Preston and

1  
2  
3 O'Bannon (1997) suggest that managers reduce expenditures on social performance to increase  
4 short-term profitability and their personal compensation, but, when financial performance is poor,  
5 they divert attention by expenditures on social programs. Other papers documenting a negative  
6 relationship are those of Freedman and Jaggi (1982), Ingram and Frazier (1983), Waddock and  
7 Graves (1997).  
8  
9

10  
11  
12 How to interpret these controversial results ? In the well known story about the blind men and the  
13 elephant each blind man can get only part of the truth by touching a part of the body of the elephant.  
14

15  
16  
17 The group of blind men acquires reasonable knowledge of the phenomenon under investigation (the  
18 elephant) only when the partial and insufficient information collected by each individual is pooled.  
19

20  
21  
22 The story suggests that the above described differences in findings across the three groups of papers  
23 do not necessarily reflect mistakes or inaccuracies, but, most often, differences in perspective  
24 (observation periods, companies included in the sample, measures of corporate performance and  
25 methodological approaches adopted for the empirical analysis). It also suggests that the  
26 combination of them, or an empirical research broadening the scope of the analysis and integrating  
27 many of these perspectives, may give us a more complete picture of the effects of SR on corporate  
28 performance (our "elephant").  
29  
30  
31  
32  
33  
34  
35  
36  
37  
38  
39

40  
41 Our paper follows this direction as it aims to implement the existing research in the field from  
42 several points of view. First, it uses panel data and takes into account a significantly long time  
43 period, controlling for business cycle effects with year dummies and for spurious correlations  
44 between variables with cointegrating panel techniques. Second, it introduces firm specific intercepts  
45 (fixed effects), thereby separating the impact of CSR from time invariant, firm idiosyncratic,  
46 characteristics. Third, it explores the impact of exit from CSR with specific reference to a range of  
47 different motivations (labour relationships, sales of weapons, corporate governance, environment)  
48 on corporate performance. Fourth, it proxies the relative risk of holding CSR stocks by testing for  
49 the difference in conditional volatility and in its reaction to shocks between CSR and control sample  
50 stocks.

#### 4. The Social domini criteria

The Domini Social Index 400 (DSI 400) developed by Kinder, Lydenberger and Domini has created a series of widely acknowledged SR criteria which gradually became an international standard.<sup>4</sup>

These criteria determine the inclusion of stocks into the index itself and, with it, the opportunity of being selected in portfolios of ethical funds.<sup>5</sup>

Social domini criteria are divided into eight big domains: i) community; ii) corporate governance; iii) diversity; iv) employee relations; v) environment; vi) human rights; vii) product quality; viii) controversial business issues. For each of them the Domini index identifies strengths and weaknesses, and lists a series of corporate actions falling under one of the two (see Appendix 1).

##### 4.1 Domini requirements with cost increasing potential

The inspection of these criteria immediately shows that there are no “free lunches” in SR, revealing how several SR actions are clearly cost-increasing. In the *community* section we find as strengths *charitable giving, support for education and support for housing*. In the *diversity* section we find work benefits (*the company has outstanding employee benefits or other programs addressing work/life concerns, e.g. childcare, eldercare or flextime*). In the employee relations section we find as strengths *cash profit sharing programs, health and safety strength and strong retirement benefit*

---

<sup>4</sup> The index methodology presents advantages and drawbacks. Its advantages are that it reflects historical concerns of investors, keeps track of CSR evolution in time and includes all dimensions identified as important in CSR. Its first limit is the absence of a measure of intensity in corporate performance. Another important problem with the index is in the adoption of a “best in class process” in which relative, but not absolute, best SR performers in some industries have been included with the specific aim of keeping the index sufficiently diversified, thereby allowing ethical fund investors to adopt well diversified passive investment strategies. Finally, a third limit is that the index must have a constant number of constituents. Therefore, for any exit a new entry is needed, with the effect that entry timing is determined not solely by firm progress on CSR, but also by rebalancing needs.

<sup>5</sup> The weight of these funds in financial markets is growing considerably. According to *2003 Report on Socially Responsible Investing Trends in the United States* the industry of ethically managed mutual fund assets represented \$2.16 trillion dollars when including all US private and institutional ethically screened portfolios. Based on these figures one out of nine dollars under professional management in the United States was part of socially responsible portfolios.

1  
2  
3 *programs*. In the *environment* section we find as strengths *clean air programs*. This item is for  
4  
5 companies which have *taken significant measures to reduce [their] impact on climate change and*  
6  
7 *air pollution through use of renewable energy and clean fuels or through energy efficiency* or for  
8  
9 companies that have *demonstrated a commitment to promoting climate-friendly policies and*  
10  
11 *practices outside its own operations*. The impact of these measures on costs is not necessarily  
12  
13 positive, but it is highly suspected to be so. In the *human right* section we find the item of  
14  
15 *Indigenous Peoples Relations Strength (the company has established relations with indigenous*  
16  
17 *peoples near its proposed or current operations –either in or outside the U.S- that respect the*  
18  
19 *sovereignty, land, culture, human rights and intellectual property of the indigenous peoples)* and  
20  
21 *Labor Rights Strength (the company has outstanding transparency on overseas sourcing disclosure*  
22  
23 *and monitoring or has particularly good union relations outside the U.S.)*. Here again, good  
24  
25 relationships with local workers and stakeholders are expected to have some costs in terms of  
26  
27 missed opportunities of labour cost reductions.  
28  
29  
30  
31  
32  
33  
34  
35

#### 36 **4.2 Domini requirements with cost decreasing (or productivity enhancing) potential**

37  
38 Against all these potentially cost increasing factors we find only one clearly cost-decreasing SR  
39  
40 initiative in the *corporate governance* section (the limited compensation of the manager) and a profit  
41  
42 or productivity enhancing domain related to product quality.  
43  
44

45  
46 On the other hand, our inspection of Domini affiliation also suggests that some of the same cost  
47  
48 increasing items commented above may have a dual effect including, on the positive side, the  
49  
50 capacity of increasing workers participation and productivity. First, limits to managerial  
51  
52 compensation may increase workers' satisfaction if the latter have inequality aversion in their  
53  
54 preferences. Second, the presence of a program of *Work/Life Benefits (the company has*  
55  
56  
57  
58  
59  
60

---

The same Report illustrates that, from 1995 to 2003 the rate of growth of assets involved in social investing, through screening of retail and institutional funds, shareholder advocacy, and community investing has been 40 percent higher than all professionally managed investment assets in the U.S (240 against 174 percent).

*outstanding employee benefits or other programs addressing work/life concerns, e.g. childcare, eldercare or flextime)* may increase workers involvement with the company.

Last but not least, a positive reaction of workers in terms of productivity may also be generated by strength factors in the *employee relations* section. These are: i) *Cash Profit Sharing (the company has a cash profit-sharing program through which it has recently made distributions to a majority of its workforce)*; ii) *Employee Involvement (the company strongly encourages worker involvement and/or ownership through stock options available to a majority of its employees, gain sharing, stock ownership, sharing of financial information, or participation in management decision-making)*; iii) *Health and Safety Strength (the company is noted by the US Occupational Health and Safety Administration for its safety programs)*; iv) *Retirement Benefits Strength (the company has a notably strong retirement benefits program)*; v) *Union Relations (the company has a history of notably strong union relations)*; vi) *Other Strength (the company has strong employee relations initiatives not covered by other KLD ratings)*.

The goal of our paper is to test whether the cost increasing factors related to CSR (and, specifically, to Domini affiliation) prevail over the factors which should increase workers motivation and lead to higher productivity. Furthermore, we want to evaluate whether, as it is implicit in its same characteristics, CSR choice may lead to some forms of redistribution of corporate value from shareholders to stakeholders.

## 5.1 The econometric specification and descriptive findings

In order to test the impact of Domini affiliation on corporate performance we choose the following specification:

$$Y_{it} = \alpha_0 + \gamma_i + \alpha_1 \log(\text{Size}) + \alpha_2 \text{Domini} + \alpha_3 \text{Entry} + \alpha_4 \log(\text{Postexit}) + \sum_{k=1}^{n-1} \beta_k \text{Reasexit}_k + \sum_{t=1}^{m-1} \delta_t \text{Year}_t + \varepsilon_{it}$$

(1)

1  
2  
3 where  $Y_{it}$  is a chosen performance variable (eg. return on equity, return on investment, return on  
4 capital employed,<sup>6</sup> total sales per employee),  $\gamma_i$  is the time invariant firm idiosyncratic (fixed) effect,  
5  
6  
7  
8  $Size$  is the number of firm employees,  $Domini$  is a (zero/one) dummy measuring affiliation to the  
9  
10 Domini 400 index;  $Entry$  is a dummy which takes the value of one in the year of entry into the  
11  
12 Domini 400 index and zero otherwise;  $Postexit$  is a variable measuring the number of years  
13  
14 following exit from the Domini 400 index;  $Reasexit_k$  is the  $k^{th}$  dummy taking the value of one in  
15  
16 the year of exit when the specific exit rationale (*Military, Environment, Productquality, Badgovnce*  
17  
18 *and Badlabour*) applies. Finally,  $Year_t$  is a year  $t$  dummy picking up year effects.

19  
20  
21  
22 In our estimate we therefore try to disentangle the effects of corporate social responsibility (proxied  
23  
24 by Domini affiliation) from business cycle effects (year dummies) and idiosyncratic characteristics  
25  
26 (e.g. management quality) of each firm (proxied by the fixed effect measured through the firm  
27  
28 specific intercept component  $u_i$ ).

29  
30  
31  
32 To provide an example of the relevance of this approach, it may happen that the association of  
33  
34 Domini affiliation with a positive performance in a given dependent variable depends from the fact  
35  
36 that high performers are more likely to search for Domini affiliation than low performers. In this  
37  
38 case the causation would be reversed with good performance causing Domini affiliation and not  
39  
40 vice versa. In our estimate fixed effects should capture differences in ex ante characteristics and the  
41  
42 Domini variable should measure just the net effect of CSR.

43  
44  
45  
46 The use of fixed effect controls for measurement errors arising from the use of industry dummies as  
47  
48 well. The identification of firm specific characteristics goes in fact deeper than the identification of  
49  
50 industry characteristics, since industry classifications are becoming always more imperfect  
51  
52 taxonomies for firms with increasingly diversified product mix.

53  
54  
55  
56  
57  
58  
59  
60  

---

<sup>6</sup> Return on capital employed is equal to Operating income/(Shareholders' equity + Interest bearing liabilities). Its advantage is that it includes in the denominator and indicator which depends on firm indebtedness and therefore does not suffer, like ROE, of sensitiveness to firm leverage (i.e. highly leveraged firms tend, by definition, to have significantly higher ROE than non highly leveraged ones)

1  
2  
3 Table 1 presents preliminary descriptive findings on the distribution of variables used for the  
4 econometric analysis showing that the median value for ROI (ROE) is around 10 (15) percent and  
5 that more than 5 (10) percent of ROI (ROE) observations are negative.  
6  
7

8  
9  
10 Table 2 illustrates descriptive findings on the distribution of the dependent variables selected for the  
11 econometric analysis according to the three subgroups of firms which are never (*non domini*),  
12 always (*sempredomini*) or, at some moment in the observation period, (*domini*) in the Domini  
13 index. The analysis is provided for the overall sample and for the size and R&D/non R&D investing  
14 subsamples which we will consider also in the econometric analysis. A relevant finding is that  
15 average *non domini* total sales per employee (return on equity) are (is) always lower than in the  
16 *sempredomini* subgroup with the exception of the small cap (large cap) subsample. Overall,  
17 descriptive findings do not help much in obtaining a clear cut picture of the impact of SR on  
18 corporate performance and econometric analysis is needed to disentangle ex ante identity from  
19 Domini affiliation effects.

## 36 **5.2 Results from econometric analysis**

37  
38  
39  
40

41 The standard techniques applied to time series require, before estimating a model, that series are  
42 I(0) or, if not, that they have at least one cointegrating vector. This is to avoid that significant  
43 relationships between the dependent variable and the regressors are led by spurious correlations.  
44 These techniques are now being applied also to the time dimension of individuals in panels. The  
45 application of these techniques to panel data is complex and requires the formulation of joint  
46 hypotheses on the stationarity of the time series of each of the individuals (in our case firms) being  
47 part of the panel.  
48  
49  
50  
51  
52  
53  
54  
55  
56

57 We first test for the stationarity of non discrete series in our estimates (firm size, net sales per  
58 worker, return on equity, on investment and on capital employed) by using the Fisher's test,  
59 developed by Maddala and Wu (1999), based on the p-values from N independent unit root tests.  
60

1  
2  
3 The null hypothesis assumes that all series are non stationary. The test has two alternatives. The  
4 homogeneous alternative (all series are stationary) and the heterogeneous alternative (some series  
5 are stationary and some others are not). The null hypothesis is rejected for our dependent variables  
6 (see Table 3.1).  
7  
8  
9  
10  
11

12 The problem is that with the Fisher test we cannot discriminate between the homogeneous and the  
13 heterogeneous alternative. For this reason we add the Im-Pesaran-Shin (2003) diagnostic in which  
14 the null hypothesis that all series are nonstationary is tested against the heterogeneous alternative.<sup>7</sup>  
15 The test does not lead to the rejection of this hypothesis for the net sales and net cash flow per  
16 employee series. The finding is consistent with the result of the Fisher test performed on individual  
17 (firm) series of the additional continuous variables (such as firm size) showing in some cases  
18 stationarity and in some others non stationarity.<sup>8</sup>  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28

29 Once verified the existence of nonstationarity in at least some of the time dimensions of our  
30 individual firm series, we can still perform a regression in levels with these variables if we find the  
31 presence of common stochastic trends (i.e. of cointegration). To check for it we use the Nyblom and  
32 Harvey (2000) test which has the advantage of allowing for serial correlation in residuals and of not  
33 requiring any model to be estimated.<sup>9</sup> The test rejects the null hypothesis of absence of common  
34 stochastic trends under the assumption of non IID standard errors (NH adj. t in Table 3.2), thereby  
35 identifying the presence of cointegrating vectors which allow us to estimate the model in levels.

51  
52

---

53 <sup>7</sup> Among authors emphasizing the importance of testing for panel cointegration to avoid spurious regressions in panel  
54 estimates see Gerdtham and Lothgren (2002) and Okunade and Karakus (2001). The latter also provide one of the  
55 earlier applications of the Im et al. (2003) test which is performed also in this paper. For an application of panel  
56 cointegration to financial ratios see Peel et al. (2004)

57 <sup>8</sup> Omitted for reasons of space and available from the authors upon request.

58 <sup>9</sup> The test does not require model estimates because is based on the rank of covariance matrix of the disturbances  
59 driving the multivariate random walk. If this rank is equal to a certain number of common trends, this implies the  
60 presence of cointegration and vice-versa. If the rank is equal to zero, as in the null hypothesis, then there are no  
common trends among the variables. Thus, failure to reject the null hypothesis of zero common trends is also an  
indication that the variables do not form a cointegrated combination.

1  
2  
3 A first important result of the estimates presented in tables 4.1-4.4 shows that the joint  
4  
5 insignificance of the fixed effects is rejected, confirming that idiosyncratic factors matter and their  
6  
7 omission is likely to bias empirical findings.  
8  
9

10 Our empirical findings document that permanence into Domini index is associated with 13 percent  
11  
12 higher total sales per employee after controlling for size, business cycle effects and idiosyncratic  
13  
14 firm characteristics (Table 4.1, column 1). The positive total sales performance is consistent (even  
15  
16 though not coincident) with findings from Stanwick and Stanwick (1998), Verschnoor (1998) and  
17  
18 Ruf et al. (2001) mentioned in section 3. In the same estimate we find that doubling the years after  
19  
20 Domini exit reduces total sales per employee by 23 percent in the overall sample and is associated  
21  
22 with a significantly reduced performance (around 21, 23 and 23 percent respectively for each of the  
23  
24 three profitability indicators, ROI, ROE and ROCE) (Table 4.1, columns, 2, 3 and 4). These  
25  
26 findings are not at odds with the Friedman (1984) hypothesis that CSR helps to reduce transaction  
27  
28 costs with stakeholders but may be also explained by a distress factor which affect both  
29  
30 performance and exit from the Domini.  
31  
32  
33  
34

35  
36 Columns 2 to 4 (table 4.1) show that Domini affiliation is associated with a reduction of return on  
37  
38 investment, return on equity and return on capital employed of around 10, 6 and 10 percent  
39  
40 respectively. Note that the effect of Domini affiliation on ROE is not significant in the overall  
41  
42 sample estimate but that it becomes so when large or R&D investing firms are excluded from the  
43  
44 sample (Tables 4.2-4.6). This negative effect is compensated by the positive impact of entry into the  
45  
46 Domini index on ROI and ROCE in the estimates in which large caps are excluded from the sample  
47  
48 (table 4.2) More generally, estimates in Table 4.2 in which large caps are excluded from the sample  
49  
50 reveals an overall deterioration of the Domini effect since the positive impact on total sales  
51  
52 disappears and the negative effect on profitability indicators become stronger.  
53  
54  
55  
56

57 Moreover, negative post exit effects on profitability indicators seem to exist (and to be stronger) for  
58  
59 non large capitalisation firms (around 62 percent lower return on capital employed and 60 percent  
60  
lower return on investment) (table 4.2).

1  
2  
3 When we reestimate the model for non R&D investing firms only the results of the overall sample  
4 are confirmed with some slight differences: i) Domini affiliation has a significant effect on total  
5 sales per worker even when large caps are excluded from the sample (16 percent with large caps  
6 and 9 percent without large caps) (tables 4.3 and 4.4, column 1); ii) the negative effects of Domini  
7 affiliation on profitability indicators tends to be larger in these subsamples (tables 4.3 and 4.4,  
8 columns 2 to 4).  
9

10 Overall, findings reported in tables 4.1-4.4 outline a picture in which SR seems consistent with the  
11 shift in focus from shareholders wealth maximisation to a multistakeholders welfare approach. SR  
12 firms productivity is equal or, in some cases, significantly higher than in the control sample while,  
13 at the same time, return on equity is significantly lower. These findings clearly match with our  
14 interpretation of SR criteria described in section 4. Such criteria are shown to generate transfers of  
15 wealth to stakeholders and workers, but are also interpreted as having the potential effect of  
16 increasing workers motivation and productivity.  
17

18 To control further for endogeneity and reverse causation we wonder whether some permanent  
19 characteristics distinguish Domini affiliated firms from the control sample or, in other terms, if  
20 firms which will be included in the Domini index are idiosyncratically different in quality with  
21 respect to the control sample.  
22

23 We therefore test whether average fixed effects for the control sample and for firms which are in the  
24 Domini index at some moment in our sample interval are significantly different. Our findings (last  
25 rows of tables 4.1-4.6) show that SR firms have significantly higher net sales and return on  
26 investment fixed effects before and after controlling for size and industry effects (in all of the six  
27 estimated samples) in the overall and in all subgroup estimates. The difference between fixed  
28 effects of Domini and non Domini firms is not significant in the return on equity estimate. Our  
29 interpretation is that Domini affiliation significantly reinforces traits of corporate identity which  
30 were already in place before entry. Summing up all our findings we are led to conclude that: i) SR  
31 firms have ex ante higher total sales per worker and higher return on investment, ii) their  
32

60

1  
2  
3 permanence into the Domini index generates a new significant independent effect in one case  
4 consistent (higher total sales per worker) and in another not consistent (lower return on equity) with  
5  
6  
7  
8 ex ante characteristics.  
9

## 10 11 12 13 **6. Domini affiliation and conditional stock return volatility** 14

15  
16 The relatively lower ROE of SR firms does not necessarily mean that SR stocks are not a good  
17 business. The comparative performance of equities must be obviously evaluated on the risk-return  
18 perspective. In this perspective, relatively lower returns on equity of SR firms may be compensated  
19 by relatively lower risk. Following Boccardelli and De Santo (2005) we test the relative risk of a  
20 buy-and-hold investment strategy on our SR stocks *vis à vis* the same strategy on our control  
21 sample by building an index of stock returns for the two subsamples and estimate their conditional  
22 volatility with a simple GARCH (1,1)<sup>10</sup> (Nelson, 1989; Engle, 1990; Engle and Ng, 1993).

where  $R_t$  is the average subgroup (SR or control sample) one-day compounded return,  $DW_j$  is the  
j-th dummy measuring “day of the week” effects,  $DJ$  is a dummy for “January” effect and  
 $\varepsilon_t \approx (0, h_t)$  is the error term.

The standard specification adopted for testing the asset market volatility in the second (variance)  
equation of a GARCH (1,1) model is given by:

$$h_t = b_0 + b_1 \varepsilon_{t-1}^2 + b_2 h_{t-1} \quad (3)$$

<sup>10</sup> Preliminary tests on normality and ARCH LM tests show that observed returns are non normal and have an ARCH structure. More complex (asymmetric, nonlinear) conditional heteroskedasticity models have also been estimated giving results which are not substantially different in terms of the effect of SR. Results are omitted for reasons of space and available upon request.

1  
2  
3 where  $h_t$  is the conditional variance of the error term in (2),  $\varepsilon_{t-1}^2$  measures the impact of news on  
4 conditional variance and  $h_{t-1}$  is the conditional variance autoregressive component which measures  
5 persistence of the dependent variable.  
6  
7  
8  
9

10 Mean equations for the two (Domini and control sample) indexes (table 5) have some common  
11 elements. One period lagged daily log returns have small but significant effects on the dependent  
12 variable. Moreover, the control sample (non SR firms) exhibits also a negative and significant  
13 Monday effect, consistently with several previous results in literature (Taylor, 1986).  
14  
15  
16  
17  
18

19 Kurtosis and skewness tests, performed on the residuals obtained from the best estimation of the  
20 base equations, show that the distribution is not normal. The existence of excess kurtosis confirms  
21 the “stylized fact” of thick tails for financial time series, which was firstly observed by Mandelbrot  
22 (1963 a, b). The sum of the ARCH and GARCH coefficients is very close to one, indicating that  
23 volatility shocks are quite persistent (but lower than one).  
24  
25  
26  
27  
28  
29  
30  
31

32 A relevant finding is that 95 percent confidence intervals of the first equation intercept overlap and  
33 therefore we find no difference in excess returns between the SR and the non SR portfolios.  
34  
35  
36

37 The main differences between the two indexes are that the Monday effect is significant and negative  
38 only in the control sample index and that the intercept in the second equation is significantly lower  
39 (at 90 percent) for the Domini index. Figure 1 plots conditional volatility for the two indexes and  
40 confirms that the conditional volatility of the Domini index is almost always lower than that of the  
41 control sample index.  
42  
43  
44  
45  
46  
47  
48

49 The quality of the SR index is not just that of having relatively lower conditional volatility but also  
50 that of having a significantly reduced volatility reaction to large shocks. In Table 6 the model is  
51 reestimated by adding a dummy which tests the change in conditional volatility after the burst of the  
52 Nasdaq stock market bubble in March 2000. The approach used for evaluating the impact of  
53 changes in stock price volatility after news' releases or regime shifts follows previous research from  
54 Choi and Kim (2002), Crain and Lee (1996), Becchetti and Caggese (2000) and Wang et al. (2002).  
55  
56  
57  
58  
59  
60

1  
2  
3 Our findings show in this case that the impact is significantly lower in the social responsibility  
4 index.  
5  
6

7  
8 A possible interpretation of this result hinges upon the different nature of those investing SR and  
9 non SR portfolios. According to the *2003 Report on Socially Responsible Investing Trends in the*  
10 *United States*, the highest growth component (80 percent) in the growth of assets involved in social  
11 investing from 1995 to 2003 has been that of community investing<sup>11</sup>. The nature of the latter, and  
12 generally of most SR investors, is therefore expected to be “more patient” and long-term oriented  
13 with respect to non SR investors. An indirect evidence of it is provided in the same report by the  
14 comparison of the accumulated equity fund flows of SR and non SR funds in the US between  
15 January 2001 and May 2003 where we assist to a constant growth in the stock of SR fund assets  
16 compared to a sharp drop in the non SR funds in the mid of this period.

## 32 **7. Conclusions**

33  
34  
35  
36 Corporate social responsibility is a multifaceted complex phenomenon involving a set of actions  
37 which are expected to affect significantly cost structures and workers participation to productive  
38 activity. As a consequence, the scope of empirical investigations on the effects of CSR on corporate  
39 performance must be such that the highest number of hidden dimensions of the problem can be  
40 discovered and analysed.  
41  
42  
43  
44  
45  
46  
47

48 This paper tries to do so by enlarging the observed estimation period, by discriminating among  
49 different reasons for entry or exit from a selected measure of CSR and by controlling for business  
50 cycle effects and for time invariant idiosyncratic characteristics of the observed firms.  
51  
52  
53

54  
55 Our empirical approach allows us to disclose many unexplored dimensions of the CSR/corporate  
56 performance relationship.  
57  
58  
59  
60

---

<sup>11</sup> Community development financial institutions primarily provide loan financing to businesses in areas that need economic development. CDFIs make loans that are generally "unbankable" by traditional industry standards because of past credit problems, the size of the loan request, limited equity from founders or limited collateral.

1  
2  
3 Our findings are consistent with the hypothesis that CSR is expected, in principle, to redirect the  
4 focus of corporate activity from the maximization of shareholders to that of stakeholders interests.  
5  
6 We observe in fact that workers in SR firms produce “larger cakes” (total sales per employee are  
7 significantly higher), but a smaller portion of these cakes goes to shareholders (returns on equity  
8 are significantly lower when large caps or R&D investing firms are not in the sample and returns on  
9 capital invested and on investment are always lower). The “penalty” that social responsibility  
10 imposes on shareholders (relatively lower return on equity) seems to be compensated by reduced  
11 conditional volatility of SR vis à vis the control sample. In fact, if the ROE of socially responsible  
12 firms is significantly lower when we exclude large firms from the sample, risk adjusted returns of  
13 the SR portfolio are not significantly different from those of the control sample.  
14  
15

16  
17  
18  
19  
20  
21  
22  
23  
24  
25  
26  
27 A second robust finding is the significantly negative impact (both in terms of productivity and  
28 return on equity) of exit from the Domini index. This result documents negative consequences  
29 arising when a CSR stance is abandoned. Limits of our information do not allow to verify whether  
30 the event reveals an exogenous negative shock on firm competitiveness which also leads to  
31 exclusion from the Domini or whether the shock depends on reduced productivity of workers or on  
32 sanctions imposed by socially responsible consumers.

Legend of the dependent variables: *TOTALSALES*: total sales per employee; *R&D*: Research and Development per employee; *ROI*: Return on Investment; *ROE*: Return on Equity; *ROCE*: Return on Capital Employed.

*SEMPREDOMINI*: observations relative to firms being part of the Domini index throughout all the sample period; *NONDOMINI*: observations when sample firms are not part of the Domini index; *DOMINI*: observations when sample firms are part of the Domini index.

**Table 3.1. Panel Unit Root Test**

Fisher t-test: the null hypothesis is that all series are non stationary against the homogeneous alternative (all series are stationary) and the heterogeneous alternative (some series are stationary and some others are not).

IPS: Im, Pesaran and Shin (2003). The null hypothesis of the test is that all series are non stationary ( $H_0: \rho_i=1$ ) against the alternative heterogeneous hypothesis ( $H_1: \rho_i < 1$  for each  $i=1, \dots, N_1$  and  $\rho_i = 1$  for each  $i=N_1+1, \dots, N$  for some  $N_1$ )

		Size	Net sales per worker	Net cash flow per worker	ROI	ROE	ROCE
<b>Fisher t-test</b>	<i>p-value</i>	0.001	0.001	0.001	0.001	0.001	0.001
	<i>t-bar</i>	-0.774	-1.631	-3.312	-2.112	-2.691	-2.331

	<i>Critical Value 1%</i>	-1.73	-1.73	-1.73	-1.73	-1.73	-1.73
	<i>W-bar</i>	17.286	-2.584	-24.924	-35.23	-32.23	-41.14
	<i>p-value</i>	1.000	0.005	0.000	0.000	0.000	0.000

**Table 3.2 Panel Cointegration Test by Nyblom and Harvey (2000)**

The null hypothesis of the test is no cointegration ( $H_0: \text{rang}(\text{var-cov})=K=0$ ) against the alternative hypothesis of cointegration ( $H_1: \text{rango}(\text{var-cov})=K \neq 0$ ).

NH-t: the test is performed under the hypothesis of iid errors. Nh adj-T: errors are allowed to be serially correlated, and the test is performed using an estimate of the long-run variance derived from the spectral density matrix at frequency zero.

		Size	Net sales per worker	Net cash flow per worker	ROI	ROE	ROCE
<b>Fixed effects</b>	<i>NH-t</i>	7.4667	8.412	7.153	9.152	8.195	9.003

## Appendix 1

### Criteria of KLD social ratings

#### SOCIAL ISSUE RATINGS

##### COMMUNITY

**STRENGTHS Charitable Giving.** The company has consistently given over 1.5% of trailing three-year net earnings before taxes (NEBT) to charity, or has otherwise been notably generous in its giving. **Innovative Giving.** The company has a notably innovative giving program that supports nonprofit organizations, particularly those promoting self-sufficiency among the economically disadvantaged. Companies that permit nontraditional federated charitable giving drives in the workplace are often noted in this section as well. **Non-US Charitable Giving.** The company has made a substantial effort to make charitable contributions abroad, as well as in the U.S. To qualify, a company must make at least 20% of its giving, or have taken notably innovative initiatives in its giving program, outside the U.S. **Support for Housing.** The company is a prominent participant in public/private partnerships that support housing initiatives for the economically disadvantaged, e.g., the National Equity Fund or the Enterprise Foundation. **Support for Education.** The company has either been notably innovative in its support for primary or secondary school education, particularly for those programs that benefit the economically disadvantaged, or the company has prominently supported job-training programs for youth. **Other Strength.** The company has either an exceptionally strong volunteer program, in-kind giving program, or engages in other notably positive community activities.

**CONCERNS Investment Controversies.** The company is a financial institution whose lending or investment practices have led to controversies, particularly ones related to the Community Reinvestment Act. **Negative Economic Impact.** The company's actions have resulted in major controversies concerning its economic impact on the community. These controversies can include issues related to environmental contamination, water rights disputes, plant closings, "put-or-pay" contracts with trash incinerators, or other company actions that adversely affect the quality of life, tax base, or property values in the community. **Other Concern.** The company is involved with a controversy that has mobilized community opposition, or is engaged in other noteworthy community controversies.

##### CORPORATE GOVERNANCE

**STRENGTHS Limited Compensation.** The company has recently awarded notably low levels of compensation to its top management or its board members. The limit for a rating is total compensation of less than \$500,000 per year for a CEO or \$30,000 per year for outside directors. **Ownership Strength.** The company owns between 20% and 50% of another company KLD has cited as having an area of social strength, or is more than 20% owned by a firm that KLD has rated as having social strengths. When a company owns more than 50% of another firm, it has a controlling interest, and KLD treats the second firm as if it is a division of the first.

**Other Strength.** The company has an innovative compensation plan for its board or executives, a unique and positive corporate culture, or some other initiative not covered by other KLD ratings.

**CONCERNS High Compensation.** The company has recently awarded notably high levels of compensation to its top management or its board members. The limit for a rating is total compensation of more than \$10 million per year for a CEO or \$100,000 per year for outside directors. **Tax Disputes.** The company has recently been involved in major tax disputes involving more than \$100 million with the Federal, state, or local authorities. **Ownership Concern.** The company owns between 20% and 50% of a company KLD has cited as having an area of social concern, or is more than 20% owned by a firm KLD has rated as having areas of concern. When a company owns more than 50% of another firm, it has a controlling interest, and KLD treats the second firm as if it is a division of the first. **Other Concern.** The company restated its earnings over an accounting controversy, has other accounting problems, or is involved with some other controversy not covered by other KLD ratings.

## DIVERSITY

**STRENGTHS** *CEO*. The company's chief executive officer is a woman or a member of a minority group. *Promotion*. The company has made notable progress in the promotion of women and minorities, particularly to line positions with profit-and-loss responsibilities in the corporation. *Board of Directors*. Women, minorities, and/or the disabled hold four seats or more (with no double counting) on the board of directors, or one-third or more of the board seats if the board numbers less than 12. *Work/Life Benefits*. The company has outstanding employee benefits or other programs addressing work/life concerns, e.g., childcare, elder care, or flextime. *Women & Minority Contracting*. The company does at least 5% of its subcontracting, or otherwise has a demonstrably strong record on purchasing or contracting, with women- and/or minority-owned businesses. *Employment of the Disabled*. The company has implemented innovative hiring programs, other innovative human resource programs for the disabled, or otherwise has a superior reputation as an employer of the disabled. *Gay & Lesbian Policies*. The company has implemented notably progressive policies toward its gay and lesbian employees. In particular, it provides benefits to the domestic partners of its employees. *Other Strength*. The company has made a notable commitment to diversity that is not covered by other KLD ratings.

**CONCERNS** *Controversies*. The company has either paid substantial fines or civil penalties as a result of affirmative action controversies, or has otherwise been involved in major controversies related to affirmative action issues. *Non-Representation*. The company has no women on its board of directors or among its senior line managers. *Other Concern*. The company is involved in diversity controversies not covered by other KLD ratings.

## EMPLOYEE RELATIONS

**STRENGTHS** *Cash Profit Sharing*. The company has a cash profit-sharing program through which it has recently made distributions to a majority of its workforce. *Employee Involvement*. The company strongly encourages worker involvement and/or ownership through stock options available to a majority of its employees, gain sharing, stock ownership, sharing of financial information, or participation in management decision-making. *Health and Safety Strength*. The company is noted by the US Occupational Health and Safety Administration for its safety programs. *Retirement Benefits Strength*. The company has a notably strong retirement benefits program. *Union Relations*. The company has a history of notably strong union relations. *Other Strength*. The company has strong employee relations initiatives not covered by other KLD ratings.

**CONCERNS** *Union Relations*. The company has a history of notably poor union relations. *Health and Safety Concern*. The company recently has either paid substantial fines or civil penalties for willful violations of employee health and safety standards, or has been otherwise involved in major health and safety controversies. *Workforce Reductions*. The company has reduced its workforce by 15% in the most recent year or by 25% during the past two years, or it has announced plans for such reductions. *Retirement Benefits Concern*. The company has either a substantially underfunded defined benefit pension plan, or an inadequate retirement benefits program. *Other Concern*. The company is involved in an employee relations controversy that is not covered by other KLD ratings.

## ENVIRONMENT

**STRENGTHS** *Beneficial Products and Services*. The company derives substantial revenues from innovative remediation products, environmental services, or products that promote the efficient use of energy [costa], or it has developed innovative products with environmental benefits. (The term “environmental service” does not include services with questionable environmental effects, such as landfills, incinerators, waste-to-energy plants, and deep injection wells.) *Clean Energy*. The company has taken significant measures to reduce its impact on climate change and air pollution through use of renewable energy and clean fuels or through energy efficiency. The company has demonstrated a commitment to promoting climate-friendly policies and practices outside its own operations. *Communications*. The company is a signatory to the CERES Principles, publishes a notably substantive environmental report, or has notably effective internal communications systems in place for environmental best practices. *Pollution Prevention*. The company has notably strong pollution prevention programs including both emissions reductions and toxic-use reduction programs. *Recycling*. The company either is a substantial user of recycled materials as raw materials in its

manufacturing processes, or a major factor in the recycling industry. **Other Strength.** The company has demonstrated a superior commitment to management systems, voluntary programs, or other environmentally proactive activities.

**CONCERNS Hazardous Waste.** The company's liabilities for hazardous waste sites exceed \$50 million [vantaggio per le SR], or the company has recently paid substantial fines or civil penalties for waste management violations. **Regulatory Problems.** The company has recently paid substantial fines or civil penalties for violations of air, water, or other environmental regulations, or it has a pattern of regulatory controversies under the Clean Air Act, Clean Water Act or other major environmental regulations. **Ozone Depleting Chemicals.** The company is among the top manufacturers of ozone depleting chemicals such as HCFCs, methyl chloroform, methylene chloride, or bromines. **Substantial Emissions.** The company's legal emissions of toxic chemicals (as defined by and reported to the EPA) from individual plants into the air and water are among the highest of the companies followed by KLD.

**Agricultural Chemicals.** The company is a substantial producer of agricultural chemicals, *i.e.*, pesticides or chemical fertilizers. **Climate Change.** The company derives substantial revenues from the sale of coal or oil and its derivative fuel products, or the company derives substantial revenues indirectly from the combustion of coal or oil and its derivative fuel products. Such companies include electric utilities, transportation companies with fleets of vehicles, auto and truck manufacturers, and other transportation equipment companies. **Other Concern.** The company has been involved in an environmental controversy that is not covered by other KLD ratings.

## HUMAN RIGHTS

**STRENGTHS Indigenous Peoples Relations Strength.** The company has established relations with indigenous peoples near its proposed or current operations (either in or outside the U.S.) that respect the sovereignty, land, culture, human rights, and intellectual property of the indigenous peoples. **Labor Rights Strength.** The company has outstanding transparency on overseas sourcing disclosure and monitoring, or has particularly good union relations outside the U.S. **Other Strength.** The company has undertaken exceptional human rights initiatives, including outstanding transparency or disclosure on human rights issues, or has otherwise shown industry leadership on human rights issues not covered by other KLD human rights ratings.

**CONCERNS Burma Concern.** The company has operations or investment in, or sourcing from, Burma. **Labor Rights Concern.** The company's operations outside the U.S. have had major recent controversies related to employee relations and labor standards or its U.S. operations have had major recent controversies involving sweatshop conditions or child labor. **Indigenous Peoples Relations Concern.** The company has been involved in serious controversies with indigenous peoples (either in or outside the U.S.) that indicate the company has not respected the sovereignty, land, culture, human rights, and intellectual property of indigenous peoples. **Other Concern.** The company's operations outside the U.S. have been the subject of major recent human rights controversies not covered by other KLD ratings.

## PRODUCT

**STRENGTHS Quality.** The company has a long-term, well-developed, company-wide quality program, or it has a quality program recognized as exceptional in U.S. industry. **R&D/Innovation.** The company is a leader in its industry for research and development (R&D), particularly by bringing notably innovative products to market. **Benefits to Economically Disadvantaged.** The company has as part of its basic mission the provision of products or services for the economically disadvantaged.

**Other Strength.** The company's products have notable social benefits that are highly unusual or unique for its industry.

**CONCERNS Product Safety.** The company has recently paid substantial fines or civil penalties, or is involved in major recent controversies or regulatory actions, relating to the safety of its products and services. **Marketing/Contracting Controversy.** The company has recently been involved in major marketing or contracting controversies, or has paid substantial fines or civil penalties relating to advertising practices, consumer fraud, or government contracting. **Antitrust.** The company has recently paid substantial fines or civil penalties for antitrust violations such as price fixing, collusion, or predatory pricing, or is involved in recent major controversies or regulatory actions relating to antitrust allegations. **Other Concern.** The

1  
2  
3 company has major controversies with its franchises, is an electric utility with nuclear safety problems,  
4 defective product issues, or is involved in other product-related controversies not covered by other KLD  
5 ratings.  
6

## 7 8 **CONTROVERSIAL BUSINESS ISSUES**

### 9 10 **ADULT ENTERTAINMENT**

11 **Distributors.** The report includes publicly traded U.S. companies that derive 15% or more of total revenues  
12 from the *rental, sale, or distribution* (wholesale or retail) of adult entertainment media products. **Owners**  
13 **and Operators.** The report includes publicly traded U.S. companies that own and/or operate adult  
14 entertainment establishment. **Producers.** The report includes publicly traded U.S. companies that produce  
15 adult media products including movies, magazines, books, calendars, and websites. **Providers.** The report  
16 includes publicly traded U.S. companies that offer pay-per-view adult entertainment. **Ownership of an Adult**  
17 **Entertainment Company.** The company owns more than 20% of another company with adult entertainment  
18 involvement. (When a company owns more than 50% of company with adult entertainment involvement,  
19 KLD treats the adult entertainment company as a consolidated subsidiary.) **Ownership by an Adult**  
20 **Entertainment Company.** The company is more than 50% owned by a company with adult entertainment  
21 involvement.  
22  
23

### 24 25 **ALCOHOL**

26 **Licensing.** The company licenses its company or brand name to alcohol products. **Manufacturers.**  
27 Companies that are involved in the manufacture alcoholic beverages including beer, distilled spirits, or wine.  
28 **Manufacturers of Products Necessary for Production of Alcoholic Beverages.** Companies that derive 15%  
29 or more of total revenues from the supply of raw materials and other products necessary for the production of  
30 alcoholic beverages. **Retailers.** Companies that derive 15% or more of total revenues from the distribution  
31 (wholesale or retail) of alcoholic beverages. **Ownership of an Alcohol Company.** The company owns more  
32 than 20% of another company with alcohol involvement. (When a company owns more than 50% of  
33 company with alcohol involvement, KLD treats the alcohol company as a consolidated subsidiary.)  
34 **Ownership by an Alcohol Company.** The company is more than 50% owned by a company with alcohol  
35 involvement.  
36

### 37 38 **FIREARMS**

39 **Manufacturers.** The company is engaged in the production of small arms ammunition or firearms, including,  
40 pistols, revolvers, rifles, shotguns, or sub-machine guns. **Retailers.** The company derives 15% or more of  
41 total revenues from the distribution (wholesale or retail) of firearms and small arms ammunition. **Ownership**  
42 **of a Firearms Company.** The company owns more than 20% of another company with firearms  
43 involvement. (When a company owns more than 50% of company with firearms involvement, KLD treats  
44 the firearms company as a consolidated subsidiary.) **Ownership by a Firearms Company.** The company is  
45 more than 50% owned by a company with firearms involvement.  
46

### 47 48 **GAMBLING**

49 **Licensing.** The company licenses its company or brand name to gambling products. **Manufacturers.**  
50 Companies that produce goods used exclusively for gambling, such as slot machines, roulette wheels, or  
51 lottery terminals. **Owners and Operators.** Companies that own and/or operate casinos, racetracks, bingo  
52 parlors, or other betting establishments, including casinos; horse, dog, or other race tracks that permit  
53 wagering; lottery operations; on-line gambling; pari-mutuel wagering facilities; bingo; Jai-alai; and other  
54 sporting events that permit wagering. **Supporting Products or Services.** Companies that provide services in  
55 casinos that are fundamental to gambling operations, such as credit lines, consulting services, or gambling  
56 technology and technology support. **Ownership of a Gambling Company.** The company owns more than  
57 20% of another company with gambling involvement. (When a company owns more than 50% of company  
58 with gambling involvement, KLD treats the gambling company as a consolidated subsidiary.) **Ownership by**  
59 **a Gambling Company.** The company is more than 50% owned by a company with gambling involvement.  
60

***Licensing.*** The company licenses its company name or brand name to tobacco products. ***Manufacturers.*** The company produces tobacco products, including cigarettes, cigars, pipe tobacco, and smokeless tobacco products. ***Manufacturers of Products Necessary for Production of Tobacco Products.*** The company derives 15% or more of total revenues from the production and supply of raw materials and other products necessary for the production of tobacco products. ***Retailers.*** The company derives 15% or more of total revenues from the distribution (wholesale or retail) of tobacco products. ***Ownership of a Tobacco Company.*** The company owns more than 20% of another company with tobacco involvement. (When a company owns more than 50% of company with tobacco involvement, KLD treats the tobacco company as a consolidated subsidiary.) ***Ownership by a Tobacco Company.*** The company is more than 50% owned by a company with tobacco involvement.

## Maintenance of the Domini 400 Social<sup>sm</sup> Index (DS 400 Index)

Through its DS 400 Index Committee (the Committee), KLD maintains the Index at 400 companies at all times. The Committee makes all decisions about additions and removals for the DS 400, adding a company to the index at the same time that another company is removed. The Committee also creates, reviews, and maintains the Working Guidelines, publishes additional background materials, and responds to public inquiries about the maintenance of the DS 400. The Committee meets at least once a month, but may meet more frequently as needed.

Companies may be removed from the DS 400 Index at any time for one of four reasons: Corporate Actions; Failure of Exclusionary Screens<sup>12</sup>; Failure of Qualitative Screens; or Lack of Social and Financial Representation. In cases of corporate actions or failure of an exclusionary screen, a company is removed at the time the action occurs or when the company is added to one of KLD's exclusionary reports. In cases of qualitative screen failure or lack of social and financial representation, the removal generally occurs immediately after the monthly Committee meeting when the decision to remove the company is made.

The Committee maintains a ranked list of companies for addition to the DS 400 Index. The Committee seeks out companies for addition to the Index that fall into at least one of the following three categories: companies with particularly strong social stories; companies that enable the DS 400 Index to approximate the industry diversification and market capitalization of the S&P 500; and/or companies that allow the Committee to maintain the DS 400 Index with approximately 250 S&P companies, 100 Non-S&P companies for sector diversification and market capitalization, and 50 Non-S&P companies with exceptional social stories.

---

<sup>12</sup> Exclusionary screens include Military-Weapons, Alcohol, Tobacco, Firearms, Nuclear Power, and Gambling.

### List of firms which are always in the Domini index in the estimation period
