Abstract

Homogenized laws for sequences of high-contrast two-phase non-symmetric conductivities perturbed by a parameter $h$ are derived in two and three dimensions. The parameter $h$ characterizes the antisymmetric part of the conductivity for an idealized model of a conductor in the presence of a magnetic field. In dimension two an extension of the Dykhne transformation to non-periodic high conductivities permits to prove that the homogenized conductivity depends on $h$ through some homogenized matrix-valued function obtained in the absence of a magnetic field. This result is improved in the periodic framework thanks to an alternative approach, and illustrated by a cross-like thin structure. Using other tools, a fiber-reinforced medium in dimension three provides a quite different homogenized conductivity.

Keywords: homogenization, high-contrast conductivity, magneto-transport, strong field, two-phase composites.

AMS classification: 35B27, 74Q20

1 Introduction

The mathematical theory of homogenization for second-order elliptic partial differential equations has been widely studied since the pioneer works of Spagnolo on $G$-convergence [40], of Murat, Tartar on $H$-convergence [37, 38], and of Bensoussan, Lions, Papanicolaou on periodic structures [2], in the framework of uniformly bounded (both from below and above) sequences of conductivity matrix-valued functions. It is also known since the end of the seventies [24, 31] (see also the extensions [1, 22, 11, 32]) that the homogenization of the sequence of conductivity problems, in a bounded open set $\Omega$ of $\mathbb{R}^3$,

$$\begin{cases} \text{div} (\sigma_n \nabla u_n) = f & \text{in } \Omega \\ u_n = 0 & \text{on } \partial \Omega \end{cases} \tag{1.1}$$

with a uniform boundedness from below but not from above for $\sigma_n$, may induce nonlocal effects. However, the situation is radically different in dimension two since the nature of problem (1.1) is shown [10, 13] to be preserved in the homogenization process provided that the sequence $\sigma_n$ is uniformly bounded from below.

$H$-convergence theory includes the case of non-symmetric conductivities in connection with the Hall effect [28] in electrodynamics (see, e.g., [33, 39]). Indeed, in the presence of a constant magnetic field the conductivity matrix is modified and becomes non-symmetric. Here, we consider an idealized model of an isotropic conductivity $\sigma(h)$ depending on a parameter $h$ which characterizes the antisymmetric part of the conductivity in the following way:
in dimension two,
\[ \sigma(h) = \alpha I_2 + \beta h J, \quad J := \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}, \]  \quad (1.2)
where \( \alpha, \beta \) are scalar an \( h \in \mathbb{R} \),

in dimension three,
\[ \sigma(h) = \alpha I_3 + \beta \mathcal{E}(h), \quad \mathcal{E}(h) := \begin{pmatrix} 0 & -h_3 & h_2 \\ h_3 & 0 & -h_1 \\ -h_2 & h_1 & 0 \end{pmatrix}, \]  \quad (1.3)
where \( \alpha, \beta \) are scalar and \( h \in \mathbb{R}^3 \).

Since the seminal work of Bergman [3] the influence of a low magnetic field in composites has been studied for two-dimensional composites [34, 4, 17], and for columnar composites [7, 5, 8, 26, 27]. The case of a strong field, namely when the symmetric part and the antisymmetric part of the conductivity are of the same order, has been also investigated [6, 9]. Moreover, dimension three may induce anomalous homogenized Hall effects [20, 18, 19] which do not appear in dimension two [17].

In the context of high-contrast problems the situation is more delicate when the conductivities are not symmetric. An extension in dimension two of H-convergence for non-symmetric and non-uniformly bounded conductivities was obtained in [14] thanks to an appropriate div-curl lemma. More recently, the Keller, Dykhne \[30, 23\] two-dimensional duality principle which claims that the mapping
\[ A \mapsto \frac{A^T}{\det A} \]  \quad (1.4)
is stable under homogenization, was extended to high-contrast conductivities in [16]. However, the homogenization of both high-contrast and non-symmetric conductivities has not been precisely studied in the context of the strong field magneto-transport especially in dimension three. In this paper we establish an effective perturbation law for a mixture of two high-contrast isotropic phases in the presence of a magnetic field. The two-dimensional case is performed in a general way for non-periodic and periodic microstructures. It is then compared to the case of a three-dimensional fiber-reinforced microstructure.

In dimension two, following the modelization (1.2), consider a sequence \( \sigma_n(h) \) of isotropic two-phase matrix-valued conductivities perturbed by a fixed constant \( h \in \mathbb{R} \), and defined by
\[ \sigma_n(h) := (1 - \chi_n)(\alpha_1 I_2 + \beta_1 h J) + \chi_n(\alpha_{2,n} I_2 + \beta_{2,n} h J), \]  \quad (1.5)
where \( \chi_n \) is the characteristic function of phase 2, with volume fraction \( \theta_n \to 0, \alpha_1 > 0, \beta_1 \) are the constants of the low conducting phase 1, and \( \alpha_{2,n} \to \infty, \beta_{2,n} \) are real sequences of the high conducting phase 2 where \( \beta_{2,n} \) is possibly unbounded. The coefficients \( \alpha_1, \beta_1 \), respectively \( \alpha_{2,n} \) and \( \beta_{2,n} \) also have the same order of magnitude according to the strong field assumption. Assuming that the sequence \( \theta_n^{-1} \chi_n \) converges weakly-* in the sense of the Radon measures to a bounded function, and that \( \theta_n \alpha_{2,n}, \theta_n \beta_{2,n} \) converge respectively to constants \( \alpha_2 > 0, \beta_2 \), we prove (see Theorem 2.2) that the perturbed conductivity \( \sigma_n(h) \) converges in an appropriate sense of H-convergence (see Definition 1.1) to the homogenized matrix-valued function
\[ \sigma_*(h) = \sigma_0^1(\alpha_1, \alpha_2 + \alpha_2^{-1} \beta_2^2 h^2) + \beta_1 h J, \]  \quad (1.6)
for some matrix-valued function \( \sigma_0^1 \) which depends uniquely on the microstructure \( \chi_n \) in the absence of a magnetic field, and is defined for a subsequence of \( n \). The proof of the result is based on a Dykhne transformation of the type
\[ A_n \mapsto (\frac{p_n A_n + q_n J}{(p_n A_n + q_n J)^{-1} + r_n J})^{-1}, \]  \quad (1.7)
which permits to change the non-symmetric conductivity \( \sigma_n(h) \) into a symmetric one. Then, extending the duality principle (1.4) established in [16], we prove that transformation (1.7) is also stable under high-contrast conductivity homogenization.
In the periodic case, i.e. when $\sigma_n(h) := \Sigma_n(\cdot/\varepsilon_n)$ with $\Sigma_n$ $Y$-periodic and $\varepsilon_n \to 0$, we use an alternative approach based on an extension of Theorem 4.1 of [13] to $\varepsilon_nY$-periodic but non-symmetric conductivities (see Theorem 3.1). So, it turns out that the homogenized conductivity $\sigma_\ast(h)$ is the limit as $n \to \infty$ of the constant $H$-limit $(\sigma_n)_\ast$ associated with the periodic homogenization (see, e.g., [2]) of the oscillating sequence $\Sigma_n(\cdot/\varepsilon)$ as $\varepsilon \to 0$ and for a fixed $n$. Finally, the Dykhne transformation performed by Milton [34] (see also [35], Chapter 4) applied to the local periodic conductivity $\Sigma_n$ and its effective conductivity $\sigma_n$, allows us to recover the perturbed homogenized formula (1.6). An example of a periodic cross-like thin structure provides an explicit computation of $\sigma_n(h)$ (see Proposition 3.2).

To make a comparison with dimension three we restrict ourselves to the $\varepsilon_nY$-periodic fiber-reinforced structure introduced by Fenchelko, Khruslov [24] to derive a nonlocal effect in homogenization. However, in the present context the fiber radius $r_n$ is chosen to be super-critical, i.e. $r_n \to 0$ and $\varepsilon_n^2|\ln r_n| \to 0$, in order to avoid such an effect. Similarly to (1.5) and following the modelization (1.3), the perturbed conductivity is defined for $h \in \mathbb{R}^3$, by

$$
\sigma_n(h) := (1 - \chi_n)(\alpha_1 I_3 + \beta_1 \mathcal{E}(h)) + \chi_n (\alpha_2 n I_3 + \beta_2 n \mathcal{E}(h)),
$$

where $\chi_n$ is the characteristic function of the fibers which are parallel to the direction $e_3$. The form of (1.8) ensures the rotational invariance of $\sigma_n(h)$ for those orthogonal transformations which leave $h$ invariant. Under the same assumptions on the conductivity coefficients as in the two-dimensional case, with $\theta_n = \pi r_n^2$, but using a quite different approach, the homogenized conductivity is given by (see Theorem 4.1)

$$
\sigma_\ast(h) = \alpha_1 I_3 + \left( \frac{\alpha_2^3 + \alpha_2 \beta_1^2 |h|^2}{\alpha_2^2 + \beta_1^2 |h|^2} \right) e_3 \otimes e_3 + \beta_1 \mathcal{E}(h).
$$

The difference between formulas (1.6) and (1.9) provides a new example of gap between dimension two and dimension three in the high-contrast homogenization framework. As former examples of dimensional gap, we refer to the works [17, 20] about the 2d positivity property, versus the 3d non-positivity, of the effective Hall coefficient, and to the works [13, 24] concerning the 2d lack, versus the 3d appearance, of nonlocal effects in the homogenization process.

The paper is organized as follows. Section 2 and 3 deal with dimension two. In Section 2 we study the two-dimensional general (non-periodic) case thanks to an appropriate div-curl lemma. In Section 3 an alternative approach is performed in the periodic framework. Finally, Section 4 is devoted to the three-dimensional case with the fiber-reinforced structure.

**Notations**

- $\Omega$ denotes a bounded open subset of $\mathbb{R}^d$;
- $I_d$ denotes the unit matrix in $\mathbb{R}^{d \times d}$, and $J := \begin{pmatrix} 0 & -I \end{pmatrix}$;
- for any matrix $A$ in $\mathbb{R}^{d \times d}$, $A^T$ denotes the transposed of the matrix $A$, $A^s$ denotes its symmetric part;
- for $h \in \mathbb{R}^3$, $\mathcal{E}(h)$ denotes the antisymmetric matrix in $\mathbb{R}^{3 \times 3}$ defined by $\mathcal{E}(h) x := h \times x$, for $x \in \mathbb{R}^3$;
- for any $A, B \in \mathbb{R}^{d \times d}$, $A \leq B$ means that for any $\xi \in \mathbb{R}^d$, $A\xi \cdot \xi \leq B\xi \cdot \xi$; we will use the fact that for any invertible matrix $A \in \mathbb{R}^{d \times d}$, $A \geq \alpha I_d \Rightarrow A^{-1} \leq \alpha^{-1} I_d$;
- $| \cdot |$ denotes both the euclidean norm in $\mathbb{R}^d$ and the subordinate norm in $\mathbb{R}^{d \times d}$;
- for any locally compact subset $X$ of $\mathbb{R}^d$, $\mathcal{M}(X)$ denotes the space of the Radon measures defined on $X$;
• for any \( \alpha, \beta > 0 \), \( \mathcal{M}(\alpha, \beta; \Omega) \) is the set of the invertible matrix-valued functions \( A : \Omega \to \mathbb{R}^{d \times d} \) such that
\[
\forall \xi \in \mathbb{R}^d, \quad A(x)\xi \cdot \xi \geq \alpha|\xi|^2 \quad \text{and} \quad A^{-1}(x)\xi \cdot \xi \geq \beta^{-1}|\xi|^2 \quad \text{a.e. in } \Omega; \tag{1.10}
\]

• \( C \) denotes a constant which may vary from a line to another one.

In the sequel, we will use the following extension of \( H \)-convergence and introduced in [16]:

**Definition 1.1** Let \( \alpha_n \) and \( \beta_n \) be two sequences of positive numbers such that \( \alpha_n \leq \beta_n \), and let \( A_n \) be a sequence of matrix-valued functions in \( \mathcal{M}(\alpha_n, \beta_n; \Omega) \) (see (1.10)).

The sequence \( A_n \) is said to \( H(M(\Omega)^2) \)-converge to the matrix-valued function \( A_* \) if for any distribution \( f \) in \( H^{-1}(\Omega) \), the solution \( u_n \) of the problem
\[
\begin{cases}
\text{div}(A_n \nabla u_n) = f & \text{in } \Omega \\
u_n = 0 & \text{on } \partial \Omega,
\end{cases}
\]
satisfies the convergences
\[
\begin{cases}
u_n \rightharpoonup u & \text{in } H^{1}_0(\Omega) \\A_n \nabla u_n \rightharpoonup A_* \nabla u & \text{weakly-* in } M(\Omega)^2,
\end{cases}
\]
where \( u \) is the solution of the problem
\[
\begin{cases}
\text{div}(A_* \nabla u) = f & \text{in } \Omega \\
u = 0 & \text{on } \partial \Omega.
\end{cases}
\]

We now give a notation for \( H(M(\Omega)^2) \)-limits of high-contrast two-phase composites. We consider the characteristic function \( \chi_n \) of the highly conducting phase, and denote \( \omega_n := \{ \chi_n = 1 \} \).

**Notation 1.1** A sequence of isotropic two-phase conductivities in the absence of a magnetic field is denoted by
\[
\sigma^0_n(\alpha_{1,n}, \alpha_{2,n}) := (1 - \chi_n)\alpha_{1,n}I_2 + \chi_n\alpha_{2,n}I_2, \tag{1.11}
\]
with
\[
\lim_{n \to \infty} \alpha_{1,n} = \alpha_1 > 0 \quad \text{and} \quad \lim_{n \to \infty} |\omega_n| \alpha_{2,n} = \alpha_2 > 0, \tag{1.12}
\]
and its \( H(M(\Omega)^2) \)-limit is denoted by \( \sigma^0_*(\alpha_1, \alpha_2) \).

2 A two-dimensional non-periodic medium

2.1 A div-curl approach

We extend the classical div-curl lemma.

**Lemma 2.1** Let \( \Omega \) be a bounded open subset of \( \mathbb{R}^2 \). Let \( \alpha > 0 \), let \( \bar{a} \in L^{\infty}(\Omega) \) and let \( A_n \) be a sequence of matrix-valued functions in \( L^{\infty}(\Omega)^{2 \times 2} \) (not necessarily symmetric) satisfying
\[
A_n \geq \alpha I_2 \quad \text{a.e. in } \Omega \quad \text{and} \quad \frac{\det A_n}{|A_n^*|} \rightharpoonup \bar{a} \in L^{\infty}(\Omega) \quad \text{weakly-* in } M(\Omega). \tag{2.1}
\]

Let \( \xi_n \) be a sequence in \( L^2(\Omega)^2 \) and \( v_n \) a sequence in \( H^1(\Omega) \) satisfying the following assumptions:
(i) \( \xi_n \) and \( v_n \) satisfy the estimate
\[
\int_\Omega A_n^{-1}\xi_n : \xi_n \, dx + \|v_n\|_{H^1(\Omega)} \leq C; \tag{2.2}
\]
(ii) $\xi_n$ satisfies the classical condition

$$\text{div} \, \xi_n \text{ is compact in } H^{-1}(\Omega). \quad (2.3)$$

Then, there exist $\xi$ in $L^2(\Omega)^2$ and $v$ in $H^1(\Omega)$ such that the following convergences hold true up to a subsequence

$$\xi_n \rightharpoonup^{\ast} \xi \text{ weakly-}^* \text{ in } \mathcal{M}(\Omega)^2 \quad \text{and} \quad \nabla v_n \rightharpoonup \nabla v \text{ weakly in } L^2(\Omega)^2. \quad (2.4)$$

Moreover, we have the following convergence in the distribution sense

$$\xi_n \cdot \nabla v_n \rightarrow \xi \cdot \nabla v \text{ weakly in } \mathcal{D}'(\Omega).$$

**Proof of Lemma 2.1.** The proof consists in considering the "good-divergence" sequence $\xi_n$ as a sum of a compact sequence of gradients $\nabla u_n$ and a sequence of divergence-free functions $J\nabla z_n$. We then use Lemma 3.1 of [16] to obtain the strong convergence of $z_n$ in $L^2_{\text{loc}}(\Omega)$. Finally, replacing $\xi_n$ by $\nabla u_n + J\nabla z_n$, we conclude owing to integration by parts.

**First step:** Proof of convergences (2.4).

An easy computation gives

$$\left(\left(A_n^{-1}\right)^s\right)^{-1} = \frac{\det A_n}{\det A_n^s}A_n^s. \quad (2.5)$$

The sequence $\xi_n$ is bounded in $L^1(\Omega)^2$ since the Cauchy-Schwarz inequality combined with the weak-* convergence of (2.1), (2.2) and (2.5) yields

$$\left(\int_{\Omega} |\xi_n| \, dx\right)^2 \leq \int_{\Omega} \left(\left(A_n^{-1}\right)^s\right)^{-1} \, dx \int_{\Omega} \left(A_n^{-1}\right)^s \xi_n \cdot \xi_n \, dx = \int_{\Omega} \frac{\det A_n}{\det A_n^s} |A_n^s| \, dx \int_{\Omega} A_n^{-1} \xi_n \cdot \xi_n \, dx \leq C.$$

Therefore, $\xi_n$ converges up to a subsequence to some $\xi \in \mathcal{M}(\Omega)^2$ in the weak-* sense of the measures. Let us prove that the vector-valued measure $\xi$ is actually in $L^2(\Omega)^2$. Again by the Cauchy-Schwarz inequality combined with (2.1), (2.2) and (2.5) we have, for any $\Phi \in \mathcal{C}_0(\Omega)^2$,

$$\left|\int_{\Omega} \xi(dx) \cdot \Phi\right| = \lim_{n \to \infty} \left|\int_{\Omega} \xi_n \cdot \Phi \, dx\right| \leq \limsup_{n \to \infty} \left(\int_{\Omega} \frac{\det A_n}{\det A_n^s} |A_n^s| |\Phi|^2 \, dx\right)^{\frac{1}{2}} \left(\int_{\Omega} A_n^{-1} \xi_n \cdot \xi_n \, dx\right)^{\frac{1}{2}} \leq C \left(\int_{\Omega} \bar{a} |\Phi|^2 \, dx\right)^{\frac{1}{2}},$$

which implies that $\xi$ is absolutely continuous with respect to the Lebesgue measure. Since $\bar{a} \in L^\infty(\Omega)$, we also get that

$$\left|\int_{\Omega} \xi \cdot \Phi \, dx\right| \leq ||\Phi||_{L^2(\Omega)^2}$$

hence $\xi \in L^2(\Omega)^2$. Therefore, the first convergence of (2.4) holds true with its limit in $L^2(\Omega)^2$. The second one is immediate.

**Second step:** Introduction of a stream function.

By (2.3), the sequence $u_n$ in $H^1_0(\Omega)$ defined by $u_n := \Delta^{-1} (\text{div} \, \xi_n)$ strongly converges in $H^1_0(\Omega)$:

$$u_n \rightharpoonup u \quad \text{in } H^1_0(\Omega). \quad (2.6)$$

Let $\omega$ be a regular simply connected open set such that $\omega \subset \subset \Omega$. Since by definition $\xi_n - \nabla u_n$ is a divergence-free function in $L^2(\Omega)^2$, there exists (see, e.g., [25]) a unique stream function $z_n \in H^1(\omega)$ with zero $\omega$-average such that

$$\xi_n = \nabla u_n + J\nabla z_n \quad \text{a.e. in } \omega. \quad (2.7)$$
Third step: Convergence of the stream function $z_n$.

Since $\nabla u_n$ is bounded in $L^2(\Omega)^2$ by the second step, $\xi_n$ is bounded in $L^1(\Omega)^2$ by the first step and $z_n$ has a zero $\omega$-average, the Sobolev embedding of $W^{1,1}(\omega)$ into $L^2(\omega)$ combined with the Poincaré-Wirtinger inequality in $\omega$ implies that $z_n$ is bounded in $L^2(\omega)$ and thus converges, up to a subsequence still denoted by $n$, to a function $z$ in $L^2(\omega)$.

Moreover, let us define

$$S_n := (J^{-1}(A_n^{-1})^s J)^{-1}.$$ 

The Cauchy-Schwarz inequality gives

$$\int \omega S_n^{-1} \nabla z_n \cdot \nabla z_n \, dx = \int \omega J^{-1}(A_n^{-1})^s J \nabla z_n \cdot \nabla z_n \, dx$$

$$= \int \omega (A_n^{-1})^s J \nabla z_n \cdot J \nabla z_n \, dx$$

$$= \int \omega (A_n^{-1})^s [\xi_n - \nabla u_n] \cdot [\xi_n - \nabla u_n] \, dx$$

$$\leq 2 \int \omega (A_n^{-1})^s \xi_n \cdot \xi_n \, dx + 2 \int \omega (A_n^{-1})^s \nabla u_n \cdot \nabla u_n \, dx$$

$$= 2 \int \omega A_n^{-1} \xi_n \cdot \xi_n \, dx + 2 \int \omega A_n^{-1} \nabla u_n \cdot \nabla u_n \, dx.$$

The first term is bounded by (2.2) and the last term by the inequality $A_n^{-1} \leq \alpha^{-1} I_2$ and the convergence (2.6). Therefore, the sequences $v_n := z_n$ and, by (2.14), $S_n$ satisfy all the assumptions of Lemma 3.1 of [16] since, by (2.5),

$$S_n = \frac{\det A_n}{\det A_n^s} J^{-1} A_n^s J.$$

Then, we obtain the convergence

$$z_n \rightarrow z \quad \text{strongly in } L^2_{\text{loc}}(\omega). \quad (2.8)$$

Moreover, the convergence (2.6) gives

$$\xi = \nabla u + J \nabla z \quad \text{in } \mathcal{D}'(\omega). \quad (2.9)$$

Fourth step: Integration by parts and conclusion.

We have, as $J \nabla v_n$ is a divergence-free function,

$$\xi_n \cdot \nabla v_n = (\nabla u_n + J \nabla z_n) \cdot \nabla v_n = \nabla u_n \cdot \nabla v_n - \text{div} (z_n J \nabla v_n). \quad (2.10)$$

The strong convergence of $\nabla u_n$ in (2.6), the second weak convergence of (2.4) justified in the first step and (2.8) give

$$\nabla u_n \cdot \nabla v_n - \text{div} (z_n J \nabla v_n) \rightarrow \nabla u \cdot \nabla v - \text{div} (z J \nabla v) \quad \text{in } \mathcal{D}'(\omega). \quad (2.11)$$

We conclude, by combining this convergence with (2.10), (2.9) and integrating by parts, to the convergence

$$\xi_n \cdot \nabla v_n \rightarrow \nabla u \cdot \nabla v - \text{div} (z J \nabla v) = (\nabla u + J \nabla z) \cdot \nabla v = \xi \cdot \nabla v \quad \text{weakly in } \mathcal{D}'(\omega).$$

for an arbitrary open subset $\omega$ of $\Omega$. \qed

For the reader’s convenience, we first recall in Theorem 2.1 below the main result of [16] concerning the Keller duality for high contrast conductivities. Then, Proposition 2.1 is an extension of this result to a more general transformation.

6
**Theorem 2.1** ([16]) Let $\Omega$ be a bounded open subset of $\mathbb{R}^2$ such that $|\partial\Omega| = 0$. Let $\alpha > 0$, let $\beta_n$, $n \in \mathbb{N}$ be a sequence of real numbers such that $\beta_n \geq \alpha$, and let $A_n$ be a sequence of matrix-valued functions (not necessarily symmetric) in $\mathcal{M}(\alpha, \beta_n; \Omega)$. Assume that there exists a function $\bar{a} \in L^\infty(\Omega)$ such that
\[
\frac{\det A_n}{\det A_n^*}|A_n^*| \rightarrow \bar{a} \text{ weakly-* in } \mathcal{M}(\Omega).
\] (2.12)
Then, there exist a subsequence of $n$, still denoted by $n$, and a matrix-valued function $A_*$ in $\mathcal{M}(\alpha, \beta; \Omega)$, with $\beta = 2\|\bar{a}\|_{L^\infty(\Omega)}$, such that
\[
A_n \xrightarrow{H(\mathcal{M}(\Omega)^2)} A_* \quad \text{and} \quad \frac{A_n^T}{\det A_n} \xrightarrow{H(\mathcal{M}(\Omega)^2)} \frac{A_*^T}{\det A_*}.
\] (2.13)

**Proposition 2.1** Let $\Omega$ be a bounded open subset of $\mathbb{R}^2$ such that $|\partial\Omega| = 0$. Let $p_n$, $q_n$ and $r_n$, $n \in \mathbb{N}$ be sequences of real numbers converging respectively to $p > 0$, $q$ and $0$. Let $\alpha > 0$, let $\beta_n$, $n \in \mathbb{N}$ be a sequence of real numbers such that $\beta_n \geq \alpha$, and let $A_n$ be a sequence of matrix-valued functions in $\mathcal{M}(\alpha, \beta_n; \Omega)$ (not necessarily symmetric) satisfying
\[
r_nA_n \text{ is bounded in } L^\infty(\Omega)^{2\times2} \quad \text{and} \quad \frac{\det A_n}{\det A_n^*}|A_n^*| \rightarrow \bar{a} \in L^\infty(\Omega) \text{ weakly-* in } \mathcal{M}(\Omega),
\] (2.14)
and that
\[
B_n = ((p_nA_n + q_nJ)^{-1} + r_nJ)^{-1} \text{ is a sequence of symmetric matrices.}
\] (2.15)
Then, there exist a subsequence of $n$, still denoted by $n$, and a matrix-valued function $A_*$ in $\mathcal{M}(\alpha, \beta; \Omega)$, with $\beta = 2\|\bar{a}\|_{L^\infty(\Omega)}$, such that
\[
A_n \xrightarrow{H(\mathcal{M}(\Omega)^2)} A_* \quad \text{and} \quad ((p_nA_n + q_nJ)^{-1} + r_nJ)^{-1} \xrightarrow{H(\mathcal{M}(\Omega)^2)} pA_* + qJ.
\] (2.16)

**Remark 2.1** Proposition 2.1 completes Theorem 2.1 performed with the transformation
\[
A \mapsto A^T = J^{-1}A^{-1}J,
\] (2.17)
to other Dykhne transformations of type (see [35], Section 4.1):
\[
A \mapsto (pA + qJ)^{-1} + rJ = (pA + qJ)((1 - rq)I_2 + rpJA)^{-1}
\] (2.18)

**Remark 2.2** The convergence of $r_n$ to $r = 0$ is not necessary but sufficient for our purpose. If $r \neq 0$, the different convergences are conserved but lead us to the expression
\[
pA_* + qJ = B_*(1 - qr)I_2 + p rJ A_*.
\] (2.19)

**Proof of Proposition 2.1.** The proof is divided into two steps. In the first step, we use Lemma 2.1 to show the $H(\mathcal{M}(\Omega)^2)$-convergence of $\tilde{A}_n := p_nA_n + q_nJ$ to $pA_* + qJ$. In the second step, we build a matrix $Q_n$ which will be used as a corrector for $B_n$ and then use again Lemma 2.1.

**First step:** $\tilde{A}_* = pA_* + qJ$.

First of all, thanks to Theorem 2.2 [16], we already know that, up to a subsequence still denoted by $n$, $A_n$ $H(\mathcal{M}(\Omega)^2)$-converges to $A_*$. We consider a corrector $P_n$ associated with $A_n$ in the sense of Murat-Tartar (see, e.g., [38]), such that, for $\lambda \in \mathbb{R}^2$, $P_n\lambda = \nabla w_n^\lambda$ is defined by
\[
\begin{cases}
\text{div}(A_n\nabla w_n^\lambda) = \text{div}(A_*\nabla(\lambda \cdot x)) & \text{in } \Omega \\
w_n^\lambda = \lambda \cdot x & \text{on } \partial\Omega
\end{cases}
\] (2.20)
Again with Theorem 2.2 of [16] and Definition 1.1, we know that $P_n\lambda$ converges weakly in $L^2(\Omega)^2$ to $\lambda$ and $A_nP_n\lambda$ converges weakly-$*$ in $\mathcal{M}(\Omega)$ to $A_*\lambda$.

Since, for any $\lambda, \mu \in \mathbb{R}^2$,
\[
\alpha \| \nabla w_n^\mu \|^2_{L^2(\Omega)^2} \leq \int_\Omega A_n \nabla w_n^\mu \cdot \nabla w_n^\mu \, dx = \int_\Omega A_n \nabla w_n^\mu \cdot \nabla w_n^\mu \, dx \leq 2\|\bar{a}\|_{L^\infty(\Omega)} |\mu| |\Omega|^{1/2}\|\nabla w_n^\mu\|_{L^2(\Omega)^2}
\]
and
\[
\int_\Omega A_n^{-1} A_n \nabla w_n^\lambda \cdot A_n \nabla w_n^\lambda \, dx = \int_\Omega A_n \nabla w_n^\lambda \cdot \nabla w_n^\lambda \, dx,
\]
the sequences $\xi_n := A_n \nabla w_n^\lambda$ and $v_n := w_n^\mu$ satisfy (2.2) and (2.3). This combined with (2.14) implies that we can apply Lemma 2.1 to obtain
\[
\forall \lambda, \mu \in \mathbb{R}, \quad A_nP_n\lambda \cdot P_n\mu \longrightarrow A_*\lambda \cdot \mu \text{ in } \mathcal{D}'(\Omega).
\] (2.21)

We denote $\tilde{A}_n := P_n^0 A_n + q_n J$ and consider $\delta_n$ such that $\delta_n J = A_n - A_n^s$. Then, the matrix $\tilde{A}_n$ satisfies
\[
\tilde{A}_n \xi \cdot \xi = p_n A_n \xi \cdot \xi \geq p_n \alpha |\xi|^2.
\] (2.22)

Moreover,
\[
\det \tilde{A}_n = p_n^2 \det A_n^s + (p_n \delta_n + q_n)^2 \leq p_n^2 (\det A_n^s + 2\delta_n^2) + 2q_n^2 \leq 2p_n^2 \det A_n + 2q_n^2 \leq C \det A_n,
\]
the last inequality being a consequence of $A_n \geq \alpha I_2$. This inequality gives, by (2.14),
\[
\frac{\det \tilde{A}_n}{\det A_n^s} |\tilde{A}_n^s| = \frac{\det \tilde{A}_n}{p_n^2 \det A_n^s p_n|A_n^s|} \leq C \frac{\det A_n}{\det A_n^s |A_n^s|} \leq C.
\] (2.23)

Then by (2.22), (2.23) and [16] again, up to a subsequence still denoted by $n$, $\tilde{A}_n H(\mathcal{M}(\Omega)^2)$-converges to $A_*$ and we have, by the classical div-curl lemma of [38] for $JP_n\lambda \cdot P_n\mu$ and (2.21),
\[
\forall \lambda, \mu \in \mathbb{R}, \quad (p_n A_n + q_n J) P_n\lambda \cdot P_n\mu = p_n A_nP_n\lambda \cdot P_n\mu + q_n J P_n\lambda \cdot P_n\mu \overset{\mathcal{D}'(\Omega)}{\longrightarrow} pA^s\lambda \cdot \mu + qJ\lambda \cdot \mu,
\]
that can be rewritten
\[\tilde{A}_* = pA_* + qJ.\]

**Second step:** $B_* = \tilde{A}_*$.

Let $\theta \in C_c^1(\Omega)$ and $\tilde{P}_n$ a corrector associated with $\tilde{A}_n$, such that, for $\lambda \in \mathbb{R}^2$, $\tilde{P}_n \lambda = \nabla \tilde{w}_n^\lambda$ is defined by
\[
\begin{cases}
\text{div}(\tilde{A}_n \nabla \tilde{w}_n^\lambda) = \text{div}(\tilde{A}_n \nabla (\theta \lambda \cdot x)) & \text{in } \Omega \\
\tilde{w}_n^\lambda = 0 & \text{on } \partial \Omega.
\end{cases}
\] (2.24)

By Definition 1.1, we have
\[
\begin{cases}
\tilde{w}_n^\lambda \rightharpoonup \theta \lambda \cdot x & \text{weakly in } H^1_0(\Omega), \\
\tilde{A}_n \nabla \tilde{w}_n^\lambda \rightharpoonup \tilde{A}_n \nabla (\theta \lambda \cdot x) & \text{weakly-$*$ in } \mathcal{M}(\Omega)^2.
\end{cases}
\] (2.25)

Let us now consider $B_n = (\tilde{A}_n^{-1} + r_n J)^{-1}$. $B_n$ is symmetric and so is its inverse :
\[
B_n^{-1} = \tilde{A}_n^{-1} + r_n J = (\tilde{A}_n^{-1} + r_n J)^s = (\tilde{A}_n^{-1})^s.
\]

We then have, by a little computation (like in (2.5)) and (2.23),
\[
\frac{\det B_n}{\det B_n^s} |B_n| = |B_n| = \left| \left( (\tilde{A}_n^{-1})^s \right)^{-1} \right| = \frac{\det \tilde{A}_n}{\det A_n^s} |A_n^s| \leq C.
\] (2.26)
For any $\xi \in \mathbb{R}^2$, the sequence $\nu_n := (I + r_n J \tilde{A}_n)^{-1} \xi$ satisfies, by (2.14),
\[
|\xi| \leq \left(1 + \|r_n \tilde{A}_n\|_{L^\infty(\Omega)^{2 \times 2}}\right) |\nu_n| \leq \left(1 + p_n \|r_n A_n\|_{L^\infty(\Omega)^{2 \times 2}} + q_n r_n \right) |\nu_n| \leq (1 + C) |\nu_n|,
\]
hence
\[
B_n \xi \cdot \xi = \tilde{A}_n \nu_n \cdot (I + r_n J \tilde{A}_n) \nu_n = \tilde{A}_n \nu_n \cdot \nu_n = p_n A_n \nu_n \cdot \nu_n \geq p_n \alpha |\nu_n|^2 \geq \frac{p_n}{(1 + C)^2} |\xi|^2 \geq C |\xi|^2 \tag{2.27}
\]
with $C > 0$. Therefore, with (2.27) and (2.26), again by Theorem 2.2 of [16], up to a subsequence still denoted by $n$, $B_n \ H(M(\Omega)^2)$-converges to $B_\ast$.

Let $\psi \in \mathcal{C}^1_c(\Omega)$ and $R_n$ be a corrector associated to $B_n$, such that, for $\mu \in \mathbb{R}^2$, $R_n \mu = \nabla v_n^\mu$ is defined by
\[
\begin{align*}
\div (B_n \nabla v_n^\mu) &= \div (B_\ast \nabla (\psi \mu \cdot x)) \quad \text{in } \Omega \\
v_n^\mu &= 0 \quad \text{on } \partial \Omega.
\end{align*}
\tag{2.28}
\]

By Definition 1.1, we have the convergences
\[
\begin{align*}
v_n^\mu &\rightharpoonup \psi \mu \cdot x \quad \text{weakly in } H^1_0(\Omega), \\
B_n \nabla v_n^\mu &\rightharpoonup B_\ast \nabla (\psi \mu \cdot x) \quad \text{weakly-* in } M(\Omega)^2. \tag{2.29}
\end{align*}
\]

Let us define the matrix $Q_n := (I + r_n J \tilde{A}_n) \tilde{P}_n$. We have
\[
B_n Q_n = (\tilde{A}^{-1}_n + r_n J)^{-1} (I + r_n J \tilde{A}_n) \tilde{P}_n = (\tilde{A}^{-1}_n + r_n J)^{-1} (\tilde{A}^{-1}_n + r_n J) \tilde{A}_n \tilde{P}_n = \tilde{A}_n \tilde{P}_n. \tag{2.30}
\]

We are going to pass to the limit in $\mathcal{D}'(\Omega)$ the equality given by (2.30) and the symmetry of $B_n$:
\[
\tilde{A}_n \tilde{P}_n \lambda \cdot R_n \mu = B_n Q_n \lambda \cdot R_n \mu = Q_n \lambda \cdot B_n R_n \mu. \tag{2.31}
\]

On the one hand, $\tilde{A}_n$ satisfies (2.1) by (2.22) and (2.23). The sequences $\xi_n := \tilde{A}_n \tilde{P}_n \lambda$ and $v_n := v_n^\mu$ satisfy the hypothesis (2.3) by (2.24) and (2.2) because
\[
\int_{\Omega} (\tilde{A}_n)^{-1} \xi_n \cdot \xi_n \ dx + \|v_n\|_{H^1_0(\Omega)} = \int_{\Omega} \tilde{A}_n \tilde{P}_n \lambda \cdot \tilde{P}_n \lambda \ dx + \|v_n^\mu\|_{H^1_0(\Omega)} \ dx \leq C
\]
by (2.24) and the convergences (2.29) and (2.25). The application of Lemma 2.1, (2.25) and (2.29) give the convergence
\[
\tilde{A}_n \tilde{P}_n \lambda \cdot R_n \mu \rightharpoonup A^* \nabla (\theta \lambda \cdot x) \cdot \nabla (\psi \mu \cdot x) \quad \text{in } \mathcal{D}'(\Omega). \tag{2.32}
\]

On the other hand, we have the equality
\[
Q_n \lambda \cdot B_n R_n \mu = B_n R_n \mu \cdot \tilde{P}_n \lambda + B_n R_n \mu \cdot r_n J \tilde{A}_n \tilde{P}_n. \tag{2.33}
\]

The matrix $B_n$ satisfies (2.1) by (2.27) and (2.26). The sequences $\xi_n := B_n R_n \mu$ and $v_n := \tilde{w}_n^\lambda$ satisfy the hypothesis (2.3) by (2.28) and (2.2) of Lemma 2.1 because
\[
\int_{\Omega} (B_n)^{-1} \xi_n \cdot \xi_n \ dx + \|v_n\|_{H^1_0(\Omega)} = \int_{\Omega} B_n R_n \mu \cdot R_n \mu \ dx + \|\tilde{w}_n^\lambda\|_{H^1_0(\Omega)} \ dx \leq C
\]
by (2.28) and the convergences (2.25) and (2.29). The application of Lemma 2.1, (2.25) and (2.29) give the convergence
\[
B_n R_n \mu \cdot \tilde{P}_n \lambda \rightharpoonup B_\ast \nabla (\psi \mu \cdot x) \cdot \nabla (\theta \lambda \cdot x) \quad \text{in } \mathcal{D}'(\Omega). \tag{2.34}
\]

9
The convergence of the right part of (2.33) is more delicate. The demonstration is the same as for Lemma 2.1. Let \( \omega \) be a simply connected open subset of \( \Omega \) such as \( \omega \subset \subset \Omega \). The function 
\[
\tilde{A}_n \tilde{P}_n \lambda - \tilde{A}_n \nabla (\theta \lambda \cdot x)
\]
is divergence-free and we can introduce a function \( z_n^{\lambda} \) such as
\[
\begin{align*}
\tilde{A}_n \tilde{P}_n \lambda &= \tilde{A}_x \nabla (\theta \lambda \cdot x) + J \nabla z_n^{\lambda}, \\
z_n^{\lambda} &\to 0 \quad \text{strongly in } L^2_{\text{loc}}(\omega).
\end{align*}
\]
(2.35)
\( (2.36) \)

The equality
\[
B_n R_n \mu \cdot r_n J \tilde{A}_n \tilde{P}_n \lambda = r_n B_n R_n \mu \cdot \tilde{A}_n \nabla (\theta \lambda \cdot x) - r_n B_n R_n \mu \cdot \nabla z_n^{\lambda}
\]
leads us, by (2.29), (2.36) and the convergence to 0 of \( r_n \), like in the demonstration of Lemma 2.1, to
\[
B_n R_n \mu \cdot r_n J \tilde{A}_n \tilde{P}_n \to 0 \quad \text{in } \mathcal{D}'(\omega).
\]
(2.37)

Finally, by combining (2.31), (2.32), (2.34) and (2.37), we obtain, for any simply connected open subset \( \omega \) of \( \Omega \) such as \( \omega \subset \subset \Omega \),
\[
\tilde{A}_x \nabla (\theta \lambda \cdot x) \cdot \nabla (\psi \mu \cdot x) = B_\ast \nabla (\psi \mu \cdot x) \cdot \nabla (\theta \lambda \cdot x) \quad \text{in } \mathcal{D}'(\omega).
\]
We conclude, by taking \( \theta = 1 \) and \( \psi = 1 \) on \( \omega \) and taking into account that \( B_\ast \) is symmetric and \( \omega, \lambda, \mu \) are arbitrary, that:
\[
B_\ast = \tilde{A}_x = pA_\ast + qJ.
\]
\( \Box \)

2.2 An application to isotropic two-phase media

In this section, we study the homogenization of a two-phase isotropic medium with high contrast and non-necessarily symmetric conductivities. The study of the symmetric case in Proposition 2.2 permits to obtain Theorem 2.2 by applying the transformation of Proposition 2.1. We use Notation 1.1.

Proposition 2.2 Let \( \Omega \) be a bounded open subset of \( \mathbb{R}^2 \) such that \( |\partial \Omega| = 0 \). Let \( \omega_n, n \in \mathbb{N} \), be a sequence of open subsets of \( \Omega \) with characteristic function \( \chi_n \), satisfying \( \theta_n := |\omega_n| < 1 \), \( \theta_n \) converges to 0, and
\[
\frac{\chi_n}{\theta_n} \to a \in L^\infty(\Omega) \quad \text{weakly-* in } \mathcal{M}(\Omega).
\]
(2.38)

We assume that there exists \( \alpha_1, \alpha_2 > 0 \) and two positive sequences \( \alpha_{1,n}, \alpha_{2,n} \geq a_0 > 0 \) verifying
\[
\lim_{n \to \infty} \alpha_{1,n} = \alpha_1 \quad \text{and} \quad \lim_{n \to \infty} \theta_n \alpha_{2,n} = \alpha_2,
\]
(2.39)

and that the conductivity takes the form
\[
\sigma_n^{0}(\alpha_{1,n}, \alpha_{2,n}) = (1 - \chi_n)\alpha_{1,n}I_2 + \chi_n\alpha_{2,n}I_2.
\]
Then, there exists a subsequence of \( n \), still denoted by \( n \), and a locally Lipschitz function
\[
\sigma_\ast : (0, \infty)^2 \to \mathcal{M}(a_0, 2||a||_{\infty}; \Omega)
\]
such that
\[
\forall (\alpha_1, \alpha_2) \in (0, \infty)^2, \quad \sigma_n^{0}(\alpha_{1,n}, \alpha_{2,n}) \xrightarrow{H(\mathcal{M}(\Omega)^2)} \sigma_\ast(\alpha_1, \alpha_2).
\]
(2.40)
Proof of Proposition 2.2. The proof is divided into two parts. We first prove the theorem for \( \alpha_{1,n} = \alpha_1, \alpha_{2,n} = \theta_n^{-1}\alpha_2 \), and then treat the general case.

**First step:** The case \( \alpha_{1,n} = \alpha_1, \alpha_{2,n} = \theta_n^{-1}\alpha_2 \).

In this step we denote \( \sigma_n^0(\alpha) := \sigma_n^{0,1}(\alpha_1, \theta_n^{-1}\alpha_2) \), for \( \alpha = (\alpha_1, \alpha_2) \in (0, \infty)^2 \). Theorem 2.2 of [16] implies that for any \( \alpha \in (0, \infty)^2 \), there exists a subsequence of \( n \) such that \( \sigma_n^0(\alpha) H(M(\Omega)^2) \)-converges in the sense of Definition 1.1 to some matrix-valued function in \( M(a_0, 2\|a\|_{\infty}, \Omega) \).

By a diagonal extraction, there exists a subsequence of \( n \), still denoted by \( n \), such that

\[
\forall \alpha \in \mathbb{Q}^2 \cap (0, \infty)^2, \quad \lim_{n \to \infty} \sigma_n^0(\alpha) = \sigma^0(\alpha).
\]

We are going to show that this convergence is true any pair \( \alpha \in (0, \infty)^2 \).

We have, by (2.38), for any \( \alpha \in \mathbb{Q}^2 \cap (0, \infty)^2 \),

\[
|\sigma_n^0(\alpha)| = (1 - \chi_\alpha)\alpha_1 + \chi_\alpha \frac{\alpha_2}{\theta_n} \to \alpha_1 + \alpha_2 \quad \text{a.e. in } \Omega.
\]

By applying Theorem 2.2 of [16] with (2.42), we have the inequality

\[
|\sigma_n^0(\alpha)\lambda| \leq 2|\lambda| (\alpha_1 + \alpha_2|a|_{\infty}).
\]

For any \( \alpha \in \mathbb{Q}^2 \cap (0, \infty)^2 \) and \( \lambda \in \mathbb{R}^2 \), consider the corrector \( \omega_{\alpha,\lambda}^n \) associated with \( \sigma_n^0(\alpha) \) defined by

\[
\left\{ \begin{array}{ll}
\text{div} \left( \sigma_n^0(\alpha) \nabla \omega_{\alpha,\lambda}^n \right) &= \text{div} \left( \sigma_\alpha^0(\alpha) \lambda \right) & \text{in } \Omega, \\
\omega_{\alpha,\lambda}^n &= \lambda \cdot x & \text{on } \partial \Omega,
\end{array} \right.
\]

which depends linearly on \( \lambda \).

Let \( \alpha \in \mathbb{Q}^2 \cap (0, \infty)^2 \). Let us show that the energies

\[
\int_{\Omega} \sigma_n^0(\alpha) \nabla \omega_{\alpha,\lambda}^n \cdot \nabla \omega_{\alpha,\lambda}^n \, dx
\]

are bounded. We have, by (2.45), (2.44) and the Cauchy-Schwarz inequality

\[
\begin{align*}
\int_{\Omega} \sigma_n^0(\alpha) & \nabla \omega_{\alpha,\lambda}^n \cdot \nabla \omega_{\alpha,\lambda}^n \\
&= \int_{\Omega} \sigma_n^0(\alpha) \lambda \cdot (\nabla \omega_{\alpha,\lambda}^n - \lambda) \, dx + \int_{\Omega} \sigma_n^0(\alpha) \nabla \omega_{\alpha,\lambda}^n \cdot \lambda \, dx \\
&= \int_{\Omega} \sigma_n^0(\alpha) \lambda \cdot \nabla \omega_{\alpha,\lambda}^n \, dx - \int_{\Omega} \sigma_n^0(\alpha) \nabla \omega_{\alpha,\lambda}^n \cdot \lambda \, dx + \int_{\Omega} \sigma_n^0(\alpha) \nabla \omega_{\alpha,\lambda}^n \cdot \lambda \, dx
\end{align*}
\]

which leads us to

\[
\int_{\Omega} \sigma_n^0(\alpha) \nabla \omega_{\alpha,\lambda}^n \cdot \nabla \omega_{\alpha,\lambda}^n \, dx \leq \int_{\Omega} |\sigma_n^0(\alpha) \lambda \cdot \nabla \omega_{\alpha,\lambda}^n| \, dx + \int_{\Omega} |\sigma_n^0(\alpha) \nabla \omega_{\alpha,\lambda}^n \cdot \lambda| \, dx.
\]

On the one hand, the Cauchy-Schwarz inequality gives

\[
\left( \int_{\Omega} |\sigma_n^0(\alpha) \nabla \omega_{\alpha,\lambda}^n \cdot \lambda| \, dx \right)^2 \leq |\lambda|^2 \int_{\Omega} |\sigma_n^0(\alpha)| \, dx \int_{\Omega} \sigma_n^0(\alpha) \nabla \omega_{\alpha,\lambda}^n \cdot \nabla \omega_{\alpha,\lambda}^n \, dx
\]
that is

$$\left( \int_{\Omega} |\sigma_n^0(\alpha) \nabla w_{n,\alpha}^{\alpha,\lambda} \cdot \lambda | \, dx \right)^2 \leq |\lambda|^2 |\alpha| \int_{\Omega} \sigma_n^0(\alpha) \nabla w_{n,\alpha}^{\alpha,\lambda} \cdot \nabla w_{n,\alpha}^{\alpha,\lambda} \, dx. \quad (2.48)$$

On the other hand, by (2.43) and the Cauchy-Schwarz inequality, we have

$$\int_{\Omega} |\sigma^0(\alpha) \lambda \cdot \nabla w_{n,\alpha}^{\alpha,\lambda} | \, dx \leq 2|\lambda|(\alpha_1 + \alpha_2||\alpha||_\infty) \sqrt{\int_{\Omega} |\nabla w_{n,\alpha}^{\alpha,\lambda}|^2 \, dx}$$

$$\leq 2|\lambda|(\alpha_1 + \alpha_2||\alpha||_\infty) \sqrt{\frac{1}{\alpha_1} + \frac{1}{\alpha_2} \sqrt{\int_{\Omega} \sigma_n^0(\alpha) \nabla w_{n,\alpha}^{\alpha,\lambda} \cdot \nabla w_{n,\alpha}^{\alpha,\lambda} \, dx}}$$

that is

$$\int_{\Omega} |\sigma^0(\alpha) \lambda \cdot \nabla w_{n,\alpha}^{\alpha,\lambda} | \, dx \leq C \, |\lambda| |\alpha| \sqrt{\frac{1}{\alpha_1} + \frac{1}{\alpha_2} \sqrt{\int_{\Omega} \sigma_n^0(\alpha) \nabla w_{n,\alpha}^{\alpha,\lambda} \cdot \nabla w_{n,\alpha}^{\alpha,\lambda} \, dx}} \quad (2.49)$$

where $C$ does not depend on $n$ nor $\alpha$.

By combining (2.47) and (2.49), we have

$$\int_{\Omega} \sigma_n^0(\alpha) \nabla w_{n,\alpha}^{\alpha,\lambda} \cdot \nabla w_{n,\alpha}^{\alpha,\lambda} \, dx \leq C \, |\lambda|^2 (|\alpha| + |\alpha|^2(\alpha_1^{-1} + \alpha_2^{-1})) \quad (2.50)$$

where $C$ does not depend on $n$ nor $\alpha$.

Let $\alpha' \in \mathbb{Q}^2 \cap (0, \infty)^2$. The sequences $\xi_n := \sigma_n^0(\alpha) \nabla w_{n,\alpha}^{\alpha,\lambda}$ and $v_n := w_{n,\alpha'}^{\alpha,\lambda}$ satisfy the assumptions (2.2) and (2.3) of Lemma 2.1. By symmetry, we have the convergences

$$\left\{ \begin{array}{ll}
\sigma_n^0(\alpha) \nabla w_{n,\alpha}^{\alpha,\lambda} \cdot \nabla w_{n,\alpha'}^{\alpha',\lambda} \rightharpoonup \sigma_n^0(\alpha) \lambda \cdot \lambda \\
\sigma_n^0(\alpha') \nabla w_{n,\alpha'}^{\alpha',\lambda} \cdot \nabla w_{n,\alpha}^{\alpha,\lambda} \rightharpoonup \sigma_n^0(\alpha') \lambda \cdot \lambda 
\end{array} \right. \quad \text{weakly in } \mathcal{D}'(\Omega). \quad (2.51)$$

As the matrices are symmetric, we have

$$(\sigma_n^0(\alpha) - \sigma_n^0(\alpha')) \nabla w_{n,\alpha}^{\alpha,\lambda} \cdot \nabla w_{n,\alpha'}^{\alpha',\lambda} = \sigma_n^0(\alpha) \nabla w_{n,\alpha}^{\alpha,\lambda} \cdot \nabla w_{n,\alpha'}^{\alpha',\lambda} - \sigma_n^0(\alpha') \nabla w_{n,\alpha'}^{\alpha',\lambda} \cdot \nabla w_{n,\alpha}^{\alpha,\lambda},$$

hence

$$(\sigma_n^0(\alpha) - \sigma_n^0(\alpha')) \nabla w_{n,\alpha}^{\alpha,\lambda} \cdot \nabla w_{n,\alpha'}^{\alpha',\lambda} \rightharpoonup (\sigma_n^0(\alpha) - \sigma_n^0(\alpha')) \lambda \cdot \lambda \quad \text{weakly in } \mathcal{D}'(\Omega). \quad (2.52)$$

Let $\lambda \in \mathbb{R}^2$. We have, by the Cauchy-Schwarz inequality, with the Einstein convention

$$\int_{\Omega} |(\sigma_n^0(\alpha) - \sigma_n^0(\alpha')) \nabla w_{n,\alpha}^{\alpha,\lambda} \cdot \nabla w_{n,\alpha'}^{\alpha',\lambda} | \, dx$$

$$= \int_{\Omega \setminus \Omega_{\omega_n}} |\alpha_1 - \alpha'_1| \left| \nabla w_{n,\alpha}^{\alpha,\lambda} \cdot \nabla w_{n,\alpha'}^{\alpha',\lambda} \right| \, dx + \int_{\omega_n} |\alpha_2 - \alpha'_2| \left| \nabla w_{n,\alpha}^{\alpha,\lambda} \cdot \nabla w_{n,\alpha'}^{\alpha',\lambda} \right| \, dx$$

$$\leq |\alpha_1 - \alpha'_1| \int_{\Omega \setminus \Omega_{\omega_n}} |\nabla w_{n,\alpha}^{\alpha,\lambda}|^2 \, dx + \int_{\omega_n} |\nabla w_{n,\alpha'}^{\alpha',\lambda}|^2 \, dx$$

$$+ |\alpha_2 - \alpha'_2| \int_{\omega_n} |\nabla w_{n,\alpha}^{\alpha,\lambda}|^2 \, dx + \int_{\omega_n} |\nabla w_{n,\alpha'}^{\alpha',\lambda}|^2 \, dx$$

$$\leq |\alpha_1 - \alpha'_1| \int_{\alpha_1} \int_{\Omega \setminus \Omega_{\omega_n}} \sigma_n^0(\alpha) \nabla w_{n,\alpha}^{\alpha,\lambda} \cdot \nabla w_{n,\alpha'}^{\alpha',\lambda} \, dx + \int_{\omega_n} \sigma_n^0(\alpha) \nabla w_{n,\alpha}^{\alpha,\lambda} \cdot \nabla w_{n,\alpha'}^{\alpha',\lambda} \, dx.$$

This combined with (2.50) yields

$$\int_{\Omega} |(\sigma_n^0(\alpha) - \sigma_n^0(\alpha')) \nabla w_{n,\alpha}^{\alpha,\lambda} \cdot \nabla w_{n,\alpha'}^{\alpha',\lambda} | \leq C |\lambda|^2 \frac{|\alpha_1 - \alpha'_1|}{\sqrt{|\alpha_1||\alpha'_1|}} M(\alpha) \, M(\alpha').$$

12
The sequence of (2.52) is thus bounded in $L^1(\Omega)^2$ which implies that (2.52) holds weakly-*$\ast$ in $M(\Omega)$. Hence, we get, for any $\varphi \in \mathcal{C}_c(\Omega)$, that

$$
\int_{\Omega} |(\sigma_{\ast}^0(\alpha) - \sigma_{\ast}^0(\alpha')) \lambda \cdot \lambda| \, \varphi \, dx \leq C |\lambda|^2 \frac{|\alpha_i - \alpha_i'|}{\sqrt{\alpha_i^2}} M(\alpha) \, M(\alpha') \, \|\varphi\|_{\infty}.
$$

(2.53)

Then, the Riesz representation theorem implies that

$$
\left\|\sigma_{\ast}^0(\alpha) - \sigma_{\ast}^0(\alpha')\right\|_{L^1(\Omega)^2} \leq C \frac{|\alpha_i - \alpha_i'|}{\sqrt{\alpha_i^2}} M(\alpha) \, M(\alpha').
$$

Therefore, by the definition of $M$ in (2.50), for any compact subset $K \subset (0, \infty)^2$,

$$
\exists C > 0, \quad \forall \alpha, \alpha' \in Q^2 \cap K, \quad \left\|\sigma_{\ast}^0(\alpha) - \sigma_{\ast}^0(\alpha')\right\|_{L^1(\Omega)^2} \leq C |\alpha - \alpha'|. \tag{2.54}
$$

This estimate permits to extend the definition (2.41) of $\sigma_{\ast}^0$ on $(0, \infty)^2$ by

$$
\forall \alpha \in (0, \infty)^2, \quad \sigma_{\ast}^0(\alpha) = \lim_{\alpha' \in Q^2 \cap (0, \infty)^2} \sigma_{\ast}^0(\alpha') \quad \text{strongly in } L^1(\Omega)^2\ast. \tag{2.55}
$$

Let $\alpha \in (0, \infty)^2$. Theorem 2.2 of [16] implies that there exists a subsequence of $n$, denoted by $n'$, and a matrix-valued function $\tilde{\sigma}_{\ast} \in M(a_0,2|a|\infty;\Omega)$ such that

$$
\sigma_{n'}(\alpha) \xrightarrow{H(M(\Omega)^2)} \tilde{\sigma}_{\ast}. \tag{2.56}
$$

Repeating the arguments leading to (2.54), for any positive sequence of rational pair $(\alpha^n)_{n \in \mathbb{N}}$ converging to $\alpha$, we have

$$
\exists C > 0, \quad \left\|\tilde{\sigma}_{\ast} - \sigma_{\ast}^0(\alpha')\right\|_{L^1(\Omega)^2} \leq C |\alpha - \alpha'|, \tag{2.57}
$$

hence, by (2.55), $\tilde{\sigma}_{\ast} = \sigma_{\ast}^0(\alpha)$. Therefore by the uniqueness of the limit in (2.56), we obtain for the whole sequence satisfying (2.41)

$$
\forall \alpha \in (0, \infty)^2, \quad \sigma_n(\alpha) \xrightarrow{H(M(\Omega)^2)} \sigma_{\ast}^0(\alpha). \tag{2.58}
$$

In particular, the function $\sigma_{\ast}^0$ satisfies (2.54) and (2.55), i.e. $\sigma_{\ast}^0$ is a locally Lipschitz function on $(0, \infty)^2$.

**Second step:** The general case.

We denote $\alpha^n = (\alpha_{1,n}, \alpha_{2,n})$ and $\sigma_{n}^0(\alpha^n) = \sigma_{n}^0(\alpha_{1,n}, \alpha_{2,n})$. Theorem 2.2 of [16] implies that there exists a subsequence of $n$, denoted by $n'$, such that $\sigma_{n'}^0(\alpha^{n'}) \xrightarrow{H(M(\Omega)^2)}$ converges to some $\tilde{\sigma}_{\ast} \in M(a_0,2|a|\infty;\Omega)$ in the sense of Definition 1.1.

As in the first step, for any $\alpha^{n'} \in (0, \infty)^2$ and $\lambda \in \mathbb{R}^2$, we can consider the corrector $w_{n'}^{\alpha^{n'},\lambda}$ associated with $\sigma_{n'}^0(\alpha^{n'})$ defined by

$$
\begin{align*}
\text{div} \left(w_{n'}^{\alpha^{n'},\lambda}\right) = \text{div} \left(\tilde{\sigma}_{\ast}\lambda\right) & \quad \text{in } \Omega, \\
\frac{\partial w_{n'}^{\alpha^{n'},\lambda}}{\partial \nu} = \lambda & \quad \text{on } \partial \Omega,
\end{align*}
$$

(2.59)

which depends linearly on $\lambda$. Proceeding as in the first step, we obtain like in (2.52), with $\alpha = (\alpha_1, \alpha_2)$ the limit of $\alpha^n$ according to (2.39),

$$
\left(\sigma_{n'}^0(\alpha) - \sigma_{n'}^0(\alpha^{n'})\right) \nabla w_{n'}^{\alpha^{n'},\lambda} \cdot \nabla w_{n'}^{\alpha^{n'},\lambda} \xrightarrow{\text{weakly}} \left(\sigma_{\ast}^0(\alpha) - \tilde{\sigma}_{\ast}\right) \lambda \cdot \lambda \text{ weakly in } \mathcal{D}'(\Omega). \tag{2.60}
$$
Moreover, by the energy bound (2.50), which also holds for $\alpha^\prime$, we have, for any $\varphi \in \mathcal{D}(\Omega)$,
\[
\int_{\Omega} \left( \sigma^0_{n^\prime}(\alpha) - \sigma^0_{n^\prime}(\alpha^\prime) \right) \nabla w^{\alpha,\lambda}_{n^\prime} \cdot \nabla w^{\alpha,\lambda}_{n^\prime} \varphi \, dx \underset{n^\prime \to \infty}{\to} 0.
\]

This combined with (2.60), yields
\[
\int_{\Omega} \left( \sigma^0_{\ast}(\alpha) - \tilde{\sigma}_{\ast} \right) \lambda \cdot \lambda \varphi \, dx = 0,
\]
which implies that $\sigma^0(\alpha) = \tilde{\sigma}_{\ast}$. We conclude by a uniqueness argument. \hfill \Box

We can now obtain a result for (perturbed) non-symmetric conductivities. Then, we will use a Dykhne transformation to recover the symmetric case following the Milton approach [35] (pp. 61–65). This will allow us to apply Proposition 2.2.

**Theorem 2.2** Let $\Omega$ be a bounded open subset of $\mathbb{R}^2$ such that $|\partial \Omega| = 0$. Let $\omega_n$, $n \in \mathbb{N}$, be a sequence of open subsets of $\Omega$ and denote by $\chi_n$ their characteristic function. We assume that $\theta_n = |\omega_n| < 1$ converges to 0 and
\[
\frac{\chi_n}{\theta_n} \to a \in L^\infty(\Omega) \quad \text{weakly-}^* \text{ in } \mathcal{M}(\Omega).
\]

Consider the conductivity defined by
\[
\sigma_n(h) = (1 - \chi_n)\sigma_1(h) + \frac{\chi_n}{\theta_n}\sigma_2(h)
\]
where for $j = 1, 2$, $\sigma_j(h) = \alpha_j + h\beta_jJ \in \mathbb{R}^{2 \times 2}$ with $\alpha_1, \alpha_2 > 0$ and $(\beta_1, \beta_2) \neq (0, 0)$. Then, there exists a subsequence of $n$, still denoted by $n$, and a locally Lipschitz function
\[
\sigma^0_{\ast} : (0, \infty)^2 \to \mathcal{M} \left( \min(\alpha_1, \alpha_2), 2(\|\sigma_1\| + \|\sigma_2\| \|a\|_\infty) ; \Omega \right)
\]
such that
\[
\sigma_n(h) \underset{H(\mathcal{M}(\Omega))^2}{\to} \sigma^0_{\ast}(\alpha_1, \alpha_2 + \alpha_2^{-1}\beta_2 h^2) + h\beta_1 J.
\]

**Proof of Theorem 2.2.** We have
\[
\forall \xi \in \mathbb{R}^2, \quad \sigma_n(h)\xi \cdot \xi = (1 - \chi_n)\alpha_1|\xi|^2 + \frac{\chi_n}{\theta_n}\alpha_2|\xi|^2 \geq \min(\alpha_1, \alpha_2)|\xi|^2 \quad \text{a.e. in } \Omega
\]
and, by (2.61),
\[
|\sigma_n(h)| = (1 - \chi_n)|\sigma_1(h)| + \frac{\chi_n}{\theta_n}|\sigma_2(h)| \to |\sigma_1(h)| + a|\sigma_2(h)| \in L^\infty(\Omega) \quad \text{weakly-}^* \text{ in } \mathcal{M}(\Omega).
\]

In order to make a Dykhne transformation like in p.62 of [35], we consider two real coefficients $a_n$ and $b_n$ in such a way that
\[
B_n := (a_n\sigma_n(h) + b_n J)(a_n I_2 + J \sigma_n(h))^{-1} = \left( (p_n\sigma_n(h) + q_n J)^{-1} + r_n J \right)^{-1}
\]
is symmetric. An easy computation shows that the previous equality holds when
\[
p_n := \frac{a_n^2}{a_n^2 + b_n}, \quad q_n := \frac{a_n b_n}{a_n^2 + b_n} \quad \text{and} \quad r_n := \frac{1}{a_n}.
\]
On the one hand, the estimates (3.39) and (3.40) with $\alpha_{2,n} = \theta_n^{-1}\alpha_2$, $\beta_{2,n} = \theta_n^{-1}\beta_2$, yield (note that they are independent of $\chi_n$)
\[
p_n \sim 1, \quad q_n \to h\beta_1, \quad r_n \to 0 \quad \text{and} \quad ||r_n\sigma_n(h)||_\infty \leq C(|\sigma_1(h)| + |\sigma_2(h)|).
\]
On the other hand, as in Section 3.2, with Notation 1.1 and (3.34), we have

\[ B_n = \sigma_n^0(\alpha_{1,n}'(h), \alpha_{2,n}'(h)), \]  

(2.64)

where

\[ \alpha_{1,n}'(h) = \frac{a_n(\alpha_1 + ih\beta_1) + ib_n}{a_n + i(\alpha_1 + ih\beta_1)} \quad \text{and} \quad \alpha_{2,n}'(h) = \frac{a_n(\alpha_2/\theta_n + ih\beta_2/\theta_n) + ib_n}{a_n + i(\alpha_2/\theta_n + ih\beta_2/\theta_n)}. \]  

(2.65)

Hence, like in (3.41), we have

\[ \lim_{n \to \infty} \alpha_{1,n}'(h) = \alpha_1 \quad \text{and} \quad \lim_{n \to \infty} \theta_n \alpha_{2,n}'(h) = \alpha_2 + \alpha_2^{-1}\beta_2^2 h^2. \]  

(2.66)

We can first apply Proposition 2.2 with the conditions (2.64) and (2.66) to have the \(H(\mathcal{M}(\Omega)^2)\)-convergence of \(B_n\). Then, by virtue of Proposition 2.1, with (2.63) we get that

\[ \sigma_n(h) \xrightarrow{H(\mathcal{M}(\Omega)^2)} \sigma_n^0(\alpha_1, \alpha_2 + \alpha_2^{-1}\beta_2^2 h^2) + h\beta_1 J. \]

\[ \square \]

3 A two-dimensional periodic medium

In this section we consider a sequence \(\Sigma_n\) of matrix valued functions (not necessarily symmetric) in \(L^\infty(\mathbb{R}^2)^{2 \times 2}\), which satisfies the following assumptions:

1. \(\Sigma_n\) is \(Y\)-periodic, where \(Y := (0,1)^2\), i.e.,

\[ \forall n \in \mathbb{N}, \forall \kappa \in \mathbb{Z}^2, \quad \Sigma_n(\cdot + \kappa) = \Sigma_n(\cdot) \; \text{a.e. in } \mathbb{R}^2, \]  

(3.1)

2. \(\Sigma_n\) is equi-coercive in \(\mathbb{R}^2\), i.e.,

\[ \exists \alpha > 0 \; \text{such that} \; \forall n \in \mathbb{N}, \forall \xi \in \mathbb{R}^2, \quad \Sigma_n \xi \cdot \xi \geq \alpha |\xi|^2 \quad \text{a.e. in } \mathbb{R}^2. \]  

(3.2)

Let \(\varepsilon_n\) be a sequence of positive numbers which tends to 0. From the sequences \(\Sigma_n\) and \(\varepsilon_n\) we define the highly oscillating sequence of matrix-valued functions \(\sigma_n\) by

\[ \sigma_n(x) = \Sigma_n \left( \frac{x}{\varepsilon_n} \right), \quad \text{a.e. } x \in \mathbb{R}^2. \]  

(3.3)

By virtue of (3.1) and (3.2), \(\sigma_n\) is an equi-coercive sequence of \(\varepsilon_n\)-periodic matrix-valued functions in \(L^\infty(\mathbb{R}^2)^{2 \times 2}\). For a fixed \(n \in \mathbb{N}\), let \((\sigma_n)_\lambda\) be the constant matrix defined by

\[ \forall \lambda, \mu \in \mathbb{R}^2, \quad (\sigma_n)_\lambda \cdot \mu = \int_Y \Sigma_n \nabla W^\lambda_n \cdot \nabla W^\mu_n \, dy, \]  

(3.4)

where, for any \(\lambda \in \mathbb{R}^2\), \(W^\lambda_n \in H_2^1(Y)\), the set of \(Y\)-periodic functions belonging to \(H_{loc}^1(\mathbb{R}^2)\), is the solution of the auxiliary problem

\[ \int_Y (W^\lambda_n - \lambda \cdot y) \, dy = 0 \quad \text{and} \quad \text{div}(\Sigma_n \nabla W^\lambda_n) = 0 \quad \text{in } \mathcal{D}'(\mathbb{R}^2) \]  

(3.5)

or equivalently

\[ \begin{cases} \int_Y \Sigma_n \nabla W^\lambda_n \cdot \nabla \varphi \, dy = 0, & \forall \varphi \in H_2^1(Y) \\ \int_Y (W^\lambda_n(y) - \lambda \cdot y) \, dy = 0. \end{cases} \]  

(3.6)

Set

\[ w^\lambda_n(x) := \varepsilon_n W^\lambda_n \left( \frac{x}{\varepsilon_n} \right), \quad \text{for } x \in \Omega, \]  

(3.7)

and

\[ w_n := (w_n^{e1}, w_n^{e2}) = (w_n^1, w_n^2). \]  

(3.8)
3.1 A uniform convergence result

**Theorem 3.1** Let \( \Omega \) be a bounded open subset of \( \mathbb{R}^2 \) with a Lipschitz boundary. Consider a highly oscillating sequence of matrix-valued functions \( \sigma_n \) satisfying (3.1), (3.2), (3.3) and the constant matrix \( (\sigma_n)_* \) defined by (3.4). We assume that

\[
(\sigma_n)_* \rightarrow \sigma_* \quad \text{in } \mathbb{R}^{2\times 2}.
\]  

Consider, for \( f \in H^{-1}(\Omega) \cap W^{-1,q}(\Omega) \) with \( q > 2 \), the solution \( u_n \) of the problem

\[
P_n \quad \begin{cases}
-\text{div}(\sigma_n \nabla u_n) = f & \text{in } \Omega \\
u_n = 0 & \text{on } \partial \Omega.
\end{cases}
\]  

Then, \( u_n \) converges uniformly to the solution \( u \in H^1_0(\Omega) \) of

\[
P \quad \begin{cases}
-\text{div}(\sigma_* \nabla u) = f & \text{in } \Omega \\
u = 0 & \text{on } \partial \Omega.
\end{cases}
\]  

Moreover we have the corrector result, with the \( \varepsilon_n \)-periodic sequence \( w_n \) defined in (3.8):

\[
\nabla u_n - \sum_{i=1}^{2} \partial_i u_n \nabla w_n^i \longrightarrow 0 \quad \text{in } L^1(\Omega)^2.
\]  

**Remark 3.1** The first point of Theorem 3.1 is an extension to the non-symmetric case of the results of [13] and [15]. The uniform convergence of \( u_n \) is a straightforward consequence of Theorem 2.7 of [15] taking into account that in the present case \( \sigma_n \in L^\infty(\Omega)^{2\times 2} \) for a fixed \( n \). The fact that \( f \in W^{-1,q}(\Omega) \) with \( q > 2 \) ensures the uniform convergence.

**Proof of Theorem 3.1.**

Derivation of the limit problem \( P \).

We only have to show that \( u \) is the solution of \( P \) in (3.11). We consider a corrector \( D\tilde{w}_n : \mathbb{R}^2 \rightarrow \mathbb{R}^{2\times 2} \) associated with \( \sigma^T_n \) defined by

\[
\tilde{w}_n(x) := \varepsilon_n \mathcal{W}_n \left( \frac{x}{\varepsilon_n} \right) = \left( \varepsilon_n \mathcal{W}^1_n \left( \frac{x}{\varepsilon_n} \right), \varepsilon_n \mathcal{W}^2_n \left( \frac{x}{\varepsilon_n} \right) \right)
\]

where for \( i = 1, 2, \mathcal{W}^i_n \in H^1_\varepsilon(Y) \) is the solution of the auxiliary problem

\[
\int_Y (\mathcal{W}^i_n - e_i \cdot x) \, dx = 0 \quad \text{and} \quad \text{div} \left( \Sigma_n \nabla \mathcal{W}^i_n \right) = 0 \quad \text{in } \mathcal{D}'(\mathbb{R}^2).
\]

Again, thanks to Theorem 2.7 of [15], \( \tilde{w}_n \) converges uniformly to the identity in \( \Omega \) by the integral condition (3.13). Let \( \varphi \in \mathcal{D}(\Omega) \). We have, using the Einstein convention, by integrating by parts.
and by the Schwarz theorem \((\partial_{i,j}^2 \varphi = \partial_{j,i}^2 \varphi)\)

\[
\int_{\Omega} \sigma_n \nabla u_n \cdot \nabla (\varphi(\tilde{\omega}_n)) \, dx = \int_{\Omega} \nabla u_n \cdot \sigma_n^T \nabla \tilde{\omega}_n (\partial_i \varphi) (\tilde{\omega}_n) \, dx = \int_{\Omega} \sigma_n^T \nabla \tilde{\omega}_n \cdot \nabla (u_n \partial_i \varphi (\tilde{\omega}_n)) \, dx - \int_{\Omega} \sigma_n^T \nabla \tilde{\omega}_n \cdot \nabla \tilde{\omega}_n \, \partial_{i,j}^2 \varphi (\tilde{\omega}_n) \, u_n \, dx = - \int_{\Omega} \sigma_n^T \nabla \tilde{\omega}_n \cdot \nabla \tilde{\omega}_n \, \partial_{i,j}^2 \varphi (\tilde{\omega}_n) \, u_n \, dx
\]

This leads us to the equality

\[
\langle f, \varphi(\tilde{\omega}_n) \rangle_{H^{-1}(\Omega), H^1_0(\Omega)} = \int_{\Omega} \sigma_n \nabla u_n \cdot \nabla (\varphi(\tilde{\omega}_n)) \, dx = - \int_{\Omega} \sigma_n^s \nabla \tilde{\omega}_n \cdot \nabla \tilde{\omega}_n \, \partial_{i,j}^2 \varphi (\tilde{\omega}_n) \, u_n \, dx. \tag{3.14}
\]

To study the convergence of the last term of (3.14), we first show that \(\sigma_n^s \nabla \tilde{\omega}_n \cdot \nabla \tilde{\omega}_n \) is bounded in \(L^1(\Omega)\). We have, by periodicity and the Cauchy-Schwarz inequality

\[
\int_{\Omega} |\sigma_n^s \nabla \tilde{\omega}_n \cdot \nabla \tilde{\omega}_n| \, dx = \int_{\Omega} |\Sigma_n^s \nabla \tilde{W}_n \cdot \nabla \tilde{W}_n| \left(\frac{x}{\varepsilon_n}\right) \, dx \
\leq C \int_Y |\Sigma_n^s \nabla \tilde{W}_n \cdot \nabla \tilde{W}_n| \, dx \
\leq C \sqrt{\int_Y \Sigma_n^s \nabla \tilde{W}_n \cdot \nabla \tilde{W}_n \, dx} \sqrt{\int_Y |\Sigma_n^s \nabla \tilde{W}_n \cdot \nabla \tilde{W}_n| \, dx} \
\leq C \sqrt{(\sigma_n)_s e_i \cdot e_i \sqrt{(\sigma_n)_s e_j \cdot e_j}}
\]

which is bounded by the hypothesis (3.9). Therefore,

\[
\sigma_n^s \nabla \tilde{\omega}_n \cdot \nabla \tilde{\omega}_n \text{ is bounded in } L^1(\Omega). \tag{3.15}
\]

Due to the periodicity, we know that for \(i, j = 1, 2,\)

\[
2\sigma_n^s \nabla \tilde{\omega}_n \cdot \nabla \tilde{\omega}_n = \sigma_n^T \nabla \tilde{\omega}_n \cdot \nabla \tilde{\omega}_n + \sigma_n^T \nabla \tilde{\omega}_n \cdot \nabla \tilde{\omega}_n \to (\sigma_s)^T e_i \cdot e_j + (\sigma_s)^T e_j \cdot e_i = 2 (\sigma_s)^s e_i \cdot e_j
\]

weakly-* in \(M(\Omega)\). Hence, we get that

\[
\sigma_n^s \nabla \tilde{\omega}_n \cdot \nabla \tilde{\omega}_n \to (\sigma_s)^s e_i \cdot e_j \quad \text{weakly-* in } M(\Omega). \tag{3.16}
\]

Moreover, \(\partial_{i,j}^2 \varphi (\tilde{\omega}_n) \) converges uniformly to \(\partial_{i,j}^2 \varphi \) \(u\). Thus, by passing to the limit in (3.14), we have, again with the Einstein convention

\[
\langle f, \varphi \rangle_{H^{-1}(\Omega), H^1_0(\Omega)} = - \int_{\Omega} (\sigma_s)^s e_i \cdot e_j \, \partial_{i,j}^2 \varphi \, u \, dx = - \int_{\Omega} \sigma_s : \nabla^2 \varphi \, u \, dx.
\]
Therefore, by integrating by parts and using \( \varphi = 0 \) on \( \partial \Omega \),
\[
\int_{\Omega} \sigma s \nabla u \cdot \nabla \varphi \, dx = (f, \varphi)_{H^{-1}(\Omega), H^1_0(\Omega)}.
\] (3.17)

**Proof of the corrector result**

First of all, we show that the corrector function \( w_n \) is bounded in \( H^1(\Omega)^2 \). By the definition (3.8) of \( w_n \), the \( Y \)-periodicity of \( W^\varepsilon_n \) and the equi-coercivity of \( \Sigma_n \), we have, for \( i = 1, 2 \),
\[
\alpha \| \nabla w^\varepsilon_n \|_{L^2(\Omega)^2}^2 \leq C \| \nabla W^\varepsilon_n \|_{L^2(Y)^2}^2 \leq C \int_Y \nabla w^\varepsilon_n \cdot \nabla w^\varepsilon_n \, dx = C (\sigma_n)_{j} e_i \cdot e_i
\] (3.18)
which is bounded. This inequality combined with the uniform convergence of \( w_n \) yields to the boundedness of \( w_n \) in \( H^1(\Omega)^2 \).

Let us consider an approximation \( u^\delta \in \mathcal{D}(\Omega) \) of \( u \) such that
\[
|| u - u^\delta ||_{H^1_0(\Omega)} \leq \delta.
\] (3.19)

On the one hand, we have
\[
\int_{\Omega} \sigma_n \nabla u_n \cdot \nabla (u_n - u^\delta(w_n)) \, dx = (f, (u_n - u^\delta(w_n)))_{H^{-1}(\Omega), H^1_0(\Omega)}.
\]
Since \( w_n \) converges uniformly to identity on \( \Omega \) and is bounded in \( H^1(\Omega) \) (see (3.18)), with \( u^\delta \in \mathcal{D}(\Omega) \), \( u^\delta(w_n) \) converges weakly to \( u^\delta \) in \( H^1_0(\Omega) \). Hence, by the weak convergence of \( u_n \) to \( u \) in \( H^1_0(\Omega) \) and (3.19), we can pass to the limit the previous inequality and obtain, for any \( \delta > 0 \),
\[
\limsup_{n \to \infty} \left| \int_{\Omega} \sigma_n \nabla u_n \cdot \nabla (u_n - u^\delta(w_n)) \, dx \right| = \left| (f, u - u^\delta)_{H^{-1}(\Omega), H^1_0(\Omega)} \right| \leq C \delta.
\] (3.20)

On the other hand, similarly to the proof of the first point (3.14), we are led to the equality
\[
\int_{\Omega} \sigma_n \nabla (u^\delta(w_n)) \cdot \nabla (u_n - u^\delta(w_n)) \, dx = - \int_{\Omega} \sigma_n \nabla w^\varepsilon_n \cdot \nabla w^\varepsilon_n \cdot \partial_{ij}^2 u^\delta(w_n) \left( u_n - u^\delta(w_n) \right) \, dx.
\] (3.21)

As in the first point, \( \sigma_n \nabla w^\varepsilon_n \cdot \nabla w^\varepsilon_n \) is bounded in \( L^1(\Omega) \) (see (3.15)), \( u_n \) converges uniformly to \( u \) and \( \partial_{ij} u^\delta(w_n) \) converges uniformly to \( \partial_{ij} u^\delta \) because \( u^\delta \) is a \( \mathcal{D}(\Omega) \) function. By passing to the limit in (3.21)
\[
\int_{\Omega} \sigma_n \nabla (u^\delta(w_n)) \cdot \nabla (u_n - u^\delta(w_n)) \, dx \xrightarrow{n \to \infty} - \int_{\Omega} (\sigma_s)^{j} e_i \cdot e_j \partial_{ij}^2 u^\delta \left( u - u^\delta \right) \, dx.
\] (3.22)

Moreover, like in (3.17) we have
\[
\int_{\Omega} (\sigma_s)^{j} e_i \cdot e_j \partial_{ij}^2 u^\delta \left( u - u^\delta \right) \, dx = \int_{\Omega} \sigma_s \nabla u^\delta \cdot \nabla (u - u^\delta) \, dx.
\] (3.23)

By combining this equality with the convergence (3.22), we obtain the inequality
\[
\lim_{n \to \infty} \left| \int_{\Omega} \sigma_n \nabla (u^\delta(w_n)) \cdot \nabla (u_n - u^\delta(w_n)) \, dx \right| \leq \int_{\Omega} \sigma_n \nabla u^\delta \cdot \nabla (u - u^\delta) \, dx
\] (3.24)
\[
\leq C |\sigma_s| \| u^\delta \|_{L^2(\Omega)^2} \| u - u^\delta \|_{L^2(\Omega)^2} \leq C \delta.
\] (3.25)

Thus, by adding (3.20) and (3.25), we have
\[
\limsup_{n \to \infty} \int_{\Omega} \sigma_n \nabla (u_n - u^\delta(w_n)) \cdot \nabla (u_n - u^\delta(w_n)) \, dx \leq C \delta.
\]
which leads us, by equi-coercivity, to

\[
\limsup_{n \to \infty} \alpha \| \nabla (u_n - u^\delta(w_n)) \|_{L^2(\Omega)}^2 \\
\leq \limsup_{n \to \infty} \left| \int_{\Omega} \sigma_n \nabla (u_n - u^\delta(w_n)) \cdot \nabla (u_n - u^\delta(w_n)) \, dx \right| \leq C\delta. 
\]  

(3.26)

Thus, the Cauchy-Schwarz inequality, the boundedness of \( \nabla w_i^\delta \) in \( L^2(\Omega)^2 \) (3.18) and the Einstein convention give, for any \( \delta > 0 \),

\[
\| \nabla u_n - \nabla w_i^\delta \|_{L^1(\Omega)^2} \\
\leq \| \nabla u_n - \nabla w_i^\delta \|_{L^1(\Omega)^2} + \| \nabla w_i^\delta \|_{L^1(\Omega)^2} + \| \nabla w_i^\delta \|_{L^2(\Omega)^2} \| \partial_i (u^\delta - u) \|_{L^2(\Omega)} \\
\leq \| \nabla u_n - \nabla w_i^\delta \|_{L^1(\Omega)^2} + C\delta \\
\leq \| \nabla u_n - \nabla w_i^\delta \|_{L^1(\Omega)^2} + \| \nabla w_i^\delta \|_{L^2(\Omega)^2} \| \partial_i (u^\delta - u) \|_{L^2(\Omega)} + C\delta \\
\leq \| \nabla u_n - \nabla w_i^\delta \|_{L^1(\Omega)^2} + C(\| \partial_i u^\delta - \partial_i u \|_{L^2(\Omega)^2} + C\delta). 
\]

Since \( u^\delta \in D(\Omega) \) and \( w_n \) converges uniformly to the identity on \( \Omega \), the second term of the last inequality converges to 0. Hence, we get that

\[
\limsup_{n \to \infty} \| \nabla u_n - \nabla w_i^\delta \|_{L^1(\Omega)^2} \leq \limsup_{n \to \infty} \| \nabla u_n - \nabla w_i^\delta \|_{L^1(\Omega)^2} + C\delta. 
\]  

(3.27)

Finally, this inequality combined with (3.26) gives, for any \( \delta > 0 \),

\[
0 \leq \limsup_{n \to \infty} \| \nabla u_n - \nabla w_i^\delta \|_{L^1(\Omega)^2} \leq C\sqrt{\delta} + C\delta, 
\]

which implies the corrector result (3.12). \qed

Remark 3.2 If the solution \( u \) is a \( C^2 \) function, then the convergence (3.12) holds true in \( L^2_{loc}(\Omega) \) since we may take \( u = u^\delta \).

3.2 A two-phase result

Here, we recall a two-phase result due to G.W. Milton (see [35] pp. 61–65) using the Dykhne transformation.

In order to apply the previous theorem, we reformulate Milton’s calculus in such a way that every coefficient depends on \( n \). We then consider, for a fixed \( n \), the periodic homogenization of a conductivity \( \sigma_n(h) \) to obtain \( (\sigma_n)_n(h) \) through the link between the homogenization of the transformed conductivity and \( (\sigma_n)_n(h) \) given by formula (4.16) in [35]. Finally, we study the limit of \( (\sigma_n)_n(h) \) through the asymptotic behavior of the coefficients of the transformation, and apply Theorem 3.1 in the example Section 3.3.

In this section we consider a two-phase periodic isotropic medium. Let \( \chi_n \) be a sequence of characteristic functions of subsets of \( Y \). We define for any \( \alpha_1 > 0, \beta_1 \in \mathbb{R} \), any sequences \( \alpha_{2,n} > 0, \beta_{2,n} \in \mathbb{R} \) and any \( h \in \mathbb{R} \), a parametrized conductivity \( \Sigma_n(h) \):

\[
\Sigma_n(h) = (1 - \chi_n)(\alpha_1 I_2 + h\beta_1 J) + \chi_n(\alpha_{2,n} I_2 + h\beta_{2,n} J) \quad \text{in } Y. 
\]  

(3.28)

We still denote by \( \Sigma_n(h) \) the periodic extension to \( \mathbb{R}^2 \) of \( \Sigma_n(h) \) (which satisfies (3.1)). We assume that \( \Sigma_n(h) \) satisfies (3.2), and define \( \sigma_n(h) \) by (3.3) and \( (\sigma_n)_n(h) \) by (3.4).

We have the following result based on an analysis of [35] (pp. 61–65).

19
Proposition 3.1 Let \(\chi_n\) be a sequence of characteristic functions of subsets of \(Y\), \(\alpha_1, \alpha_2 > 0\), a positive sequence \(\alpha_{2,n}, \beta_1, \beta_2 \in \mathbb{R}\), and a sequence \(\beta_{2,n}\) such that

\[
\lim_{n \to \infty} \alpha_{2,n} = \infty, \quad \liminf_{n \to \infty} |\beta_{2,n} - \beta_1| > 0, \quad \text{and} \quad \lim_{n \to \infty} \frac{\beta_{2,n}}{\alpha_{2,n}} = \frac{\beta_2}{\alpha_2}.
\] (3.29)

Assume that the effective conductivity in the absence of a magnetic field

\[
(\sigma_n^0)_s (\gamma_{1,n}, \gamma_{2,n}) \quad \text{is bounded when} \quad \lim_{n \to \infty} \gamma_{1,n} = \alpha_1 \quad \text{and} \quad \lim_{n \to \infty} \frac{\gamma_{2,n}}{\alpha_{2,n}} = \gamma_2 > 0.
\] (3.30)

Then, there exist two parametrized positive sequences \(\alpha'_{1,n}(h), \alpha'_{2,n}(h)\) such that

\[
\lim_{n \to \infty} \alpha'_{1,n}(h) = \alpha_1 \quad \text{and} \quad \alpha'_{2,n}(h) \sim \frac{\alpha_1^2 + h^2 \beta_2^2}{\alpha_2^2} \alpha_{2,n},
\] (3.31)

and

\[
(\sigma_n)_s (h) = (\sigma_n^0)_s (\alpha'_{1,n}(h), \alpha'_{2,n}(h)) + h \beta_1 + b_n \quad \text{as} \quad n \to \infty (1)
\] (3.32)

where \((\sigma_n^0)_s (\alpha'_{1,n}(h), \alpha'_{2,n}(h))\) is bounded.

Remark 3.3 In view of condition (3.29), the case where \(\beta_{2,n}\) tends to \(\beta_1\) corresponds to perturb the symmetric conductivity

\[
\sigma^s_n = (1 - \chi_n)\alpha_1 I_2 + \chi_n \alpha_{2,n} I_2
\]

by

\[
\sigma^s_n + \beta_1 J + o(n \to \infty) (1).
\]

Then it is clear that

\[
(\sigma_n)_s (h) = (\sigma^s_n)_s + \beta_1 J + o(n \to \infty) (1).
\]

Proof of Proposition 3.1. The proof is divided into two parts. After applying Milton’s computation (pp. 61–64 of [35]), we study the asymptotic behavior of the different coefficients.

First step: Applying Dykhne’s transformation through Milton’s computations.

In order to make the Dykhne’s transformation following Milton [35] (pp. 62–64), we consider two real coefficients \(a_n, b_n\) such that

\[
\sigma'_n := (a_n \sigma_n(h) + b_n J) (a_n I_2 + J \sigma_n(h))^{-1} = a_n (\sigma_n(h) + (a_n)^{-1} b_n J) (a_n I_2 + J \sigma_n(h))^{-1}
\] (3.33)

is symmetric and, more precisely, according to Notation 1.1, reads as

\[
\sigma'_n = (1 - \chi_n) \alpha'_{1,n}(h) I_2 + \chi_n \alpha'_2, n(h) I_2 = \sigma^0_n (\alpha'_{1,n}(h), \alpha'_2, n(h)).
\] (3.34)

Then, using the complex representation

\[
\alpha I_2 + \beta J \longleftrightarrow \alpha + \beta i
\] (3.35)

suggested by Tartar [41], the constants \(a_n, b_n\) must satisfy

\[
\alpha'_{1,n}(h) = \frac{a_n (\alpha_1 + i \beta_1) + i b_n}{a_n + i (\alpha_1 + i \beta_1)} \in \mathbb{R} \quad \text{and} \quad \alpha'_2, n(h) = \frac{a_n (\alpha_{2,n} + i \beta_{2,n}) + i b_n}{a_n + i (\alpha_{2,n} + i \beta_{2,n})} \in \mathbb{R},
\] (3.36)

which implies that

\[
b_n = \frac{-a_n^2 \beta_1 + a_n \Delta_1}{a_n - \beta_1} = \frac{-a_n^2 \beta_{2,n} + a_n \Delta_{2,n}}{a_n - \beta_{2,n}}.
\] (3.37)
Denoting $\Delta_1 := \alpha_2^2 + h^2 \beta_1^2$ and $\Delta_2, n := \alpha_2^2 + h^2 \beta_2^2$, (thanks to (3.29)), $n$ is considered to be larger enough such that $\beta_2, n - \beta_1 \neq 0$ and $a_n$ is real, the equality (3.37) provides two non-zero solutions for $a_n$:

$$a_n = \frac{\Delta_2, n - \Delta_1 + \sqrt{(\Delta_2, n - \Delta_1)^2 + 4h^2(\beta_2, n - \beta_1)(\beta_2, n \Delta_1 - \beta_1 \Delta_2, n)}}{2h(\beta_2, n - \beta_1)},$$  \hspace{1cm} (3.38)

and

$$a_n = \frac{\Delta_2, n - \Delta_1 - \sqrt{(\Delta_2, n - \Delta_1)^2 + 4h^2(\beta_2, n - \beta_1)(\beta_2, n \Delta_1 - \beta_1 \Delta_2, n)}}{2h(\beta_2, n - \beta_1)}.$$  \hspace{1cm} (3.39)

The value (3.38) is associated with a positive matrix $\sigma'_n$, while $a_n^{-}$ leads us to the negative matrix $\sigma_n^{-} = -J(\sigma'_n)^{-1}J^{-1}$ to exclude (see [34] for more details).

**Second step**: asymptotic behavior of the coefficients and the homogenized matrix.

One the one hand, by the equality (3.38) combined with (3.29), we have

$$\lim_{n \to \infty} a_n \frac{h(\beta_2, n - \beta_1)}{a_2^2, n} = \frac{\alpha_2^2 + h^2 \beta_2^2}{\alpha_2^2}$$

which clearly implies that

$$a_n \sim \frac{\alpha_2^2 + h^2 \beta_2^2}{\alpha_2^2, n} \frac{a_2^2, n}{h(\beta_2, n - \beta_1)} \quad \text{and} \quad a_n - h \beta_2, n \sim \frac{\alpha_2^2, n}{h(\beta_2, n - \beta_1)}.$$ \hspace{1cm} (3.39)

On the other hand, (3.29), (3.39) and the first equality of (3.37) give

$$b_n = -a_n h \beta_1 + 1 + a_n \to \infty \quad (1).$$ \hspace{1cm} (3.40)

From (3.29), (3.38), (3.39) and (3.40) we deduce the following asymptotic behavior for the modified phases:

$$\lim_{n \to \infty} \alpha'_1, n(h) = \alpha_1 \quad \text{and} \quad \lim_{n \to \infty} \frac{\alpha'_2, n(h)}{\alpha_2, n} = \frac{\alpha_2^2 + h^2 \beta_2^2}{\alpha_2^2}.$$ \hspace{1cm} (3.41)

To consider $(\sigma'_n)_\ast$, we need to verify that $\sigma'_n$ is equi-coercive. We have, by denoting for any $\xi \in \mathbb{R}^2$, $\nu_n = (a_n I_2 + J\sigma_n(h))^{-1} \xi$,

$$\forall \xi \in \mathbb{R}^2, \quad (\sigma'_n)_\ast \cdot \xi = (a_n \sigma_n(h) + b_n J) \nu_n \cdot (a_n I_2 + J \sigma_n(h)) \nu_n = (a_n^2 + b_n) \sigma_n(h) \nu_n \cdot \nu_n$$

and, because $a_n^{-1} \sigma_n(h)$ is bounded in $L^\infty(\Omega)^{2 \times 2}$ by (3.39),

$$\forall \xi \in \mathbb{R}^2, \quad |\xi| = |a_n \nu_n + J \sigma_n(h) \nu_n| \leq a_n(1 + C)|\nu_n|.$$  \hspace{1cm} (3.42)

The equi-coercivity of $\sigma_n(h)$ gives

$$\exists C > 0, \quad \forall \xi \in \mathbb{R}^2, \quad (\sigma'_n)_\ast \cdot \xi \geq \frac{C}{(1 + C)^2} \frac{a_n^2 + b_n}{a_n^2} |\xi|^2$$

that is, for $n$ larger enough, by (3.39) and (3.40), $\sigma'_n$ is equi-coercive.

We can now apply the Keller-Dykhne duality theorem (see, e.g., [30, 23]) to equality (3.33) to obtain

$$(\sigma'_n)_\ast = (a_n (\sigma_n)_\ast + b_n J)(a_n I_2 + J (\sigma_n)_\ast)^{-1}.$$ \hspace{1cm} (3.43)

Moreover, by inverting this transformation, we have

$$(\sigma_n)_\ast(h) = (a_n I_2 - (\sigma'_n)_\ast J)^{-1}(a_n (\sigma'_n)_\ast - b_n J).$$
Figure 3.1: The period of the cross-like thin structure

Considering (3.29), (3.39), (3.40), and the boundedness of \((\sigma'_n)_*\) (as a consequence of the bound (3.30)) we get that

\[
(\sigma)_*(h) = (\sigma'_n)_* - \frac{b_n}{o_n} J + o \xrightarrow{n \to \infty} (1) = (\sigma'_n)_* + h\beta_1 J + o \xrightarrow{n \to \infty} (1),
\]

which concludes the proof taking into account (3.34).

To derive the limit of \((\sigma^0_n)_* (\alpha'_{1,n}(h), \alpha'_{2,n}(h))\), we need more information on the geometry of the high conductive phase. To this end, we study the following example.

### 3.3 A cross-like thin structure

We consider a bounded open subset \(\Omega\) of \(\mathbb{R}^2\) with a Lipschitz boundary, a real sequence \(\varepsilon_n\) converging to 0, and \(f \in H^{-1}(\Omega) \cap W^{-1,q}(\Omega)\) with \(q > 2\). We define, for any \(h \in \mathbb{R}\), \(\alpha_1, \beta_1 > 0\) and positive sequences \(t_n \in (0, 1/2), \alpha_2, n, \beta_2, n\), a parametrized matrix-valued function \(\Sigma_n(h)\) from the unit rectangular cell period \(Y := (-\frac{\ell}{2}, \frac{\ell}{2}) \times (-\frac{1}{2}, \frac{1}{2})\), with \(\ell \geq 1\), to \(\mathbb{R}^2 \times 2\), by (cf. figure 3.1)

\[
\Sigma_n(h) := \begin{cases} 
\alpha_2, n, \alpha_1 I_2 + \beta_2, n, \beta_1 h J & \text{in } \omega_n := \{(x_1, x_2) \in Y \mid |x_1|, |x_2| \leq t_n\} \\
\alpha_1 I_2 + \beta_1 h J & \text{in } Y \setminus \omega_n
\end{cases}
\]

(3.45)

Denoting again by \(\Sigma_n(h)\) its periodic extension to \(\mathbb{R}^2\), we finally consider the conductivity

\[
\sigma_n(h)(x) = \Sigma_n(h) \left( \frac{x}{\varepsilon_n} \right), \quad x \in \Omega,
\]

(3.46)

and the associated homogenization problem:

\[
\mathcal{P}_n \begin{cases} 
-\text{div}(\sigma_n(h)\nabla u_n) = f & \text{in } \Omega \\
u_n = 0 & \text{on } \partial \Omega.
\end{cases}
\]

(3.47)

By virtue of Theorem 3.1 and Proposition 3.1, we focus on the study of the limit of \((\sigma_n^0)_* (\alpha'_{1,n}(h), \alpha'_{2,n}(h))\).

**Proposition 3.2** Let \(\sigma_n(h)\) be the conductivity defined by (3.45) and (3.46) and its homogenization problem (3.47). We assume that:

\[
2t_n(\ell + 1)\alpha_2, n \xrightarrow{n \to \infty} \alpha_2 > 0 \quad \text{and} \quad 2t_n(\ell + 1)\beta_2, n \xrightarrow{n \to \infty} \beta_2 > 0.
\]

(3.48)
Then, the homogenized conductivity is given by
\[ \sigma^*(h) = \begin{pmatrix}
\alpha_1 + \frac{\alpha_2^2 + \beta_2^2 h^2}{(\ell + 1)\alpha_2} & -h\beta_1 \\
h\beta_1 & \alpha_1 + \frac{\alpha_2^2 + \beta_2^2 h^2}{\ell(\ell + 1)\alpha_2}
\end{pmatrix}. \]

**Remark 3.4** The previous proposition does not respect exactly the framework defined at the beginning of this section because the period cell is not the unit square \( Y = (0, 1)^2 \): we can nevertheless extend all this section to any type of period cells.

**Remark 3.5** The condition \( (3.48) \) is a condition of boundedness in \( L^1(\Omega) \) of \( \sigma_n \) because
\[ |\omega_n| = 2t_n(\ell + 1) - 4t^2_n \sim 2t_n(\ell + 1), \]
which will ensure the convergence of \( (\sigma^0_n)^* \).

**Proof of Proposition 3.2.** In order to apply Proposition 3.1, we consider two positive sequences \( \alpha'_{1,n}(h), \alpha'_{2,n}(h) \) satisfying
\[ \lim_{n \to \infty} \alpha'_{1,n}(h) = \alpha_1 \quad \text{and} \quad \alpha'_{2,n}(h) \sim \frac{\alpha_2^2 + h^2\beta_2^2}{\alpha_2} \alpha_{2,n}. \tag{3.49} \]
We will study the homogenization of \( \sigma'_n := \sigma^0_n(\alpha'_{1,n}(h), \alpha'_{2,n}(h)) \).

To this end, consider a corrector \( W^\lambda_n = \lambda \cdot x - X^\lambda_n \) in the Murat-Tartar sense (see, e.g., [38]) associated with
\[ \Sigma'_n := \begin{cases} \alpha'_{2,n}(h) I_2 & \text{in } \omega_n = \{(x_1, x_2) \in Y \mid |x_1|, |x_2| \leq t_n\} \\ \alpha'_{1,n}(h) I_2 & \text{in } Y \setminus \omega_n \end{cases} \tag{3.50} \]
and defined by
\[ \begin{cases} \text{div}(\Sigma'_n \nabla X^\lambda_n) = \text{div}(\Sigma'_n \lambda) & \text{in } \mathcal{D}'(\mathbb{R}^2) \\ X^\lambda_n \text{ is } Y \text{ - periodic} \\ \int_Y X^\lambda_n \, dy = 0. \end{cases} \tag{3.51} \]

On one hand, the extra diagonal coefficients of \( (\sigma'_n)^* \) are equal to 0 because, as \( \Sigma'_n \) is an even function on \( Y \), we have, for \( i = 1, 2 \),
\[ \begin{cases} y_i \mapsto W^\varepsilon_i(n)(y) & \text{is an odd function}, \\ y_i \mapsto W^\varepsilon_i(n)(y) & \text{is an even function for } i \neq j, \end{cases} \]
which implies that \( y_1 \mapsto \Sigma'_n \nabla W^\varepsilon_1 \cdot \nabla W^\varepsilon_2(n) \) is an odd function. Then, by symmetry of \( Y \) with respect to 0,
\[ \langle (\Sigma'_n \varepsilon_i \varepsilon_i)^{-1}\rangle^{-1}_{\ast} \leq (\sigma'_n)_{\ast} \varepsilon_i \varepsilon_i \leq \langle (\Sigma'_n \varepsilon_i \varepsilon_i)\rangle^{-1}_{\ast} \tag{3.52} \]
where \( \langle \cdot \rangle_i \) denotes the average with respect to \( y_i \) at a fixed \( y_j \) for \( j \neq i \).
An easy computation gives, for the direction $e_1$,
\[
(1 - 2t_n) \left( \frac{\ell - 2t_n}{\ell \alpha_{1,n}(h)} + \frac{2t_n}{\ell \alpha_{2,n}(h)} \right)^{-1} + 2t_n \left( \frac{\ell}{\ell \alpha_{2,n}(h)} \right)^{-1} \leq (\sigma'_n)_* e_1 \cdot e_1
\]
and
\[
(\sigma'_n)_* e_1 \cdot e_1 \leq \ell \left( \frac{\ell - 2t_n}{(1 - 2t_n)\alpha_{1,n}(h) + 2t_n \alpha_{2,n}(h)} + \frac{2t_n}{\alpha_{2,n}(h)} \right)^{-1}.
\]
By (3.48) and (3.49), we have the convergence
\[
\lim_{n \to \infty} (\sigma'_n)_* e_1 = \alpha_1 + \frac{\sigma^2 + \beta^2 h^2}{(\ell + 1)\alpha_2}.
\]
A similar computation on the direction $e_2$ gives the asymptotic behavior:
\[
\lim_{n \to \infty} (\sigma'_n)_* = \lim_{n \to \infty} (\sigma^0_n)_* (\alpha'_n(h), \alpha'_n(h)) = \begin{pmatrix}
\alpha_1 + \frac{\sigma^2 + \beta^2 h^2}{(\ell + 1)\alpha_2} & 0 \\
0 & \alpha_1 + \frac{\sigma^2 + \beta^2 h^2}{\ell(\ell + 1)\alpha_2}
\end{pmatrix}.
\]
Moreover, the matrix $\sigma_n(h)$ clearly satisfies all the hypothesis of Theorem 3.1. By Theorem 3.1 and (3.53), we have
\[
\lim_{n \to \infty} (\sigma_n)_* (h) = \lim_{n \to \infty} (\sigma^0_n)_* (\alpha'_n(h), \alpha'_n(h)) + \beta_1 hJ = \begin{pmatrix}
\alpha_1 + \frac{\sigma^2 + \beta^2 h^2}{(\ell + 1)\alpha_2} & -h \beta_1 \\
h \beta_1 & \alpha_1 + \frac{\sigma^2 + \beta^2 h^2}{\ell(\ell + 1)\alpha_2}
\end{pmatrix}.
\]
We finally apply Theorem 3.1 to get that $\sigma_*(h) = \lim_{n \to \infty} (\sigma_n)_*(h)$. \hfill \Box

4 A three-dimensional fibered microstructure

In this section we study a particular two-phase composite in dimension three. One of the phases is composed by a periodic set of high conductivity fibers embedded in an isotropic medium (figure 4.1a). The conductivity $\sigma_n(h)$ is not symmetric due to the perturbation of a magnetic field.

First, describe the geometry of the microstructure. Let $Y := (-\frac{1}{2}, \frac{1}{2})^3$ be the unit cube centered at the origin of $\mathbb{R}^3$. For $r_n \in (0, \frac{1}{2})$, consider the closed cylinder $\omega_n$ parallel to the $x_3$-axis, of radius $r_n$ and centered in $Y$:
\[
\omega_n := \{ y \in Y \mid y_1^2 + y_2^2 \leq r_n^2 \}. \tag{4.1}
\]
Let $\Omega = \tilde{\Omega} \times (0, 1)$ be an open cylinder of $\mathbb{R}^3$, where $\tilde{\Omega}$ is a bounded domain of $\mathbb{R}^2$ with a Lipschitz boundary. For $\varepsilon_n \in (0, 1)$, consider the closed subset $\Omega_n$ of $\Omega$ defined by the intersection of $\Omega$ with $\bar{\Omega}$ of the $\varepsilon_n Y$-periodic network in $\mathbb{R}^3$ composed by the closed cylinders parallel to the $x_3$-axis, centered on the points $\varepsilon_n k$, $k \in \mathbb{Z}^3$, in the $x_1$-$x_2$ plane, and of radius $\varepsilon_n r_n$, namely:
\[
\Omega_n := \Omega \cap \bigcup_{\nu \in \mathbb{Z}^3} \varepsilon_n (\omega_n + \nu). \tag{4.2}
\]
The period cell of the microstructure is represented in figure 4.1b.
We then define the two-phase conductivity by

$$
\sigma_n(h) = \begin{cases} 
\alpha_1 I_3 + \beta_1 \mathcal{E}(h) & \text{in } \Omega \setminus \Omega_n \\
\alpha_{2,n} I_3 + \beta_{2,n} \mathcal{E}(h) & \text{in } \Omega_n,
\end{cases}
$$

where $\alpha_1 > 0$, $\beta_1 \in \mathbb{R}$, $\alpha_{2,n} > 0$ and $\beta_{2,n}$ are real sequences, and

$$
\mathcal{E}(h) := \begin{pmatrix} 0 & -h_3 & h_2 \\
h_3 & 0 & -h_1 \\
-h_2 & h_1 & 0 \end{pmatrix}, \quad \text{for } h = \begin{pmatrix} h_1 \\
h_2 \\
h_3 \end{pmatrix} \in \mathbb{R}^3.
$$

Our aim is to study the homogenization problem

$$
P_{\Omega,n} \begin{cases} 
-\text{div}(\sigma_n(h) \nabla u_n) = f & \text{in } \Omega \\
u_n = 0 & \text{on } \partial \Omega.
\end{cases}
$$

**Theorem 4.1** Let $\alpha_1 > 0$, $\beta_1 \in \mathbb{R}$, and let $\varepsilon_n, r_n, \alpha_{2,n}, \beta_{2,n}, n \in \mathbb{N}$, be real sequences such that $\varepsilon_n, r_n > 0$ converge to 0, $\alpha_{2,n} > 0$, and

$$
\lim_{n \to \infty} \varepsilon_n^2 |\ln r_n| = 0, \quad \lim_{n \to \infty} |\omega_n| \alpha_{2,n} = \alpha_2 > 0, \quad \lim_{n \to \infty} |\omega_n| \beta_{2,n} = \beta_2 \in \mathbb{R}.
$$

Consider, for $h \in \mathbb{R}^3$, the conductivity $\sigma_n(h)$ defined by (4.3). Then, there exists a subsequence of $n$, still denoted by $n$, such that, for any $f \in H^{-1}(\Omega)$ and any $h \in \mathbb{R}^3$, the solution $u_n$ of $P_{\Omega,n}$ converges weakly in $H^1_0(\Omega)$ to the solution $u$ of

$$
P_{\Omega,*} \begin{cases} 
-\text{div}(\sigma_*(h) \nabla u) = f & \text{in } \Omega \\
u = 0 & \text{on } \partial \Omega,
\end{cases}
$$
where \( \sigma_*(h) \) is given by

\[
\sigma_*(h) = \alpha_1 I_3 + \left( \frac{\alpha_2^2 + \alpha_2 \beta_2 |h|^2}{\alpha_2^2 + \beta_2^2 h_3^2} \right) e_3 \otimes e_3 + \beta_1 \mathcal{E}(h).
\] (4.7)

**Remark 4.1** Theorem 4.1 can be actually extended to fibers with a more general cross-section. More precisely, we can replace the disk \( r_n D \) of radius \( r_n \) by the homothetic \( r_n Q \) of any connected open set \( Q \) included in the unit disk \( D \), such that the present fiber \( \omega_n \) is replaced by the new fiber \( r_n Q \times (-\frac{1}{2}, \frac{1}{2}) \) in the period cell of the microstructure.

On the one hand, this change allows us to use the same test function \( v_n \) (4.8) defined in the proof of Theorem 4.1, since \( v_n \) remains equal to 1 in the new fibers due to the inclusion \( Q \subset D \). On the other hand, Lemma 4.1 allows us to replace the disk \( D \) by the open set \( Q \subset D \).

**Remark 4.2** We can also extend the result of Theorem 4.1 to an isotropic fibered microstructure composed by three similar periodic fibers lattices arranged in the three orthogonal directions \( e_1, e_2, e_3 \), namely

\[
\omega_n := \bigcup_{j=1}^3 \left\{ y \in Y \mid \sum_{i \neq j} y_i^2 \leq r_n^2 \right\} \quad \text{and} \quad \Omega_n := \Omega \cap \bigcup_{\nu \in \mathbb{Z}^3} \varepsilon_n(\omega_n + \nu),
\]

as represented in figure 4.2. Then, we derive the following homogenization conductivity:

\[
\sigma_*(h) = \alpha_1 I_3 + \sum_{i=1}^3 \left( \frac{\alpha_2^2 + \alpha_2 \beta_2 |h|^2}{\alpha_2^2 + \beta_2^2 h_i^2} \right) e_i \otimes e_i + \beta_1 \mathcal{E}(h).
\]

**Remark 4.3** We can check that when the volume fraction \( \theta_n = \theta \) and the highly conducting phase of the conductivity \( \alpha_{2,n} = \alpha_0 \) and \( \beta_{2,n} = \beta_0 \) are independent of \( n \), the explicit formula of [27] denoted by \( \sigma_*(\theta, h) \), for the classical (since the period cell is now independent of \( n \)) periodically homogenized conductivity (see (3.4)) has a limit as \( \theta \to 0 \) when \( \theta \alpha_0 \) and \( \theta \beta_0 \) converge. Indeed, we may replace in the computations of [27] the optimal Vigdergauz shape by the circular cross-section in the previous asymptotic regime. Therefore, Theorem 4.1 validates the double process characterized by the homogenization at a fixed volume fraction \( \theta \) combined with the limit as \( \theta \to 0 \), by one homogenization process in which both the period and the volume fraction \( \theta_n = \pi r_n^2 \) of the high conductivity phase tend to 0 as \( n \to \infty \).

**Remark 4.4** The hypothesis on the convergence of \( \varepsilon_n^2 |\ln r_n| \) (4.5) allows us to avoid nonlocal effects in dimension three (see [24, 1]). These effects do not appear in dimension two as shown in [12]. Therefore, we can make a comparison between dimension two and dimension three based on the strong field perturbation in the absence of nonlocal effects.
Remark 4.5 If \( h = h_3 e_3 \), the homogenized conductivity becomes
\[
\sigma_*(h) = \alpha_1 I_3 + \alpha_2 e_3 \otimes e_3 + \beta_1 h_3 \begin{pmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}
\]
which reduces to the simplified two-dimensional case when the symmetric part of the conductivity is independent of \( h_3 \) (i.e. \( \sigma_{11}^\beta \) in (2.40) does not depend on its second argument).

Proof of Theorem 4.1 The proof will be divided into four parts. We first prove the weak-* convergence in \( \mathcal{M}(\Omega) \) of \( \sigma_n(h) \nabla u_n \) in \( \Omega_n \). Then we establish a linear system satisfied by the limits defined by
\[
\frac{1}{|\omega_n|} \frac{\partial u_n}{\partial x_i} \rightarrow \xi_i \quad \text{weakly-* in } \mathcal{M}(\Omega).
\]
Moreover, we deduce from Lemma 4.1 that
\[
\frac{1}{|\omega_n|} \frac{\partial u_n}{\partial x_3} \rightarrow \frac{\partial u}{\partial x_3} \quad \text{weakly-* in } \mathcal{M}(\Omega).
\]
We finally calculate the homogenized matrix.

We first remark that, classically, the sequence of solutions \( u_n \) of \( \mathcal{P}_{\Omega,n} \) (see (4.4)) is bounded in \( H_0^1(\Omega) \) because, since \( \alpha_{2,n} \) diverges to \( \infty \):
\[
||\nabla u_n||_{L^2(\Omega)}^2 \leq C \int_\Omega (\alpha_1 \mathbf{1}_{\Omega,n} I_3 + \alpha_{2,n} \mathbf{1}_{\Omega,n} I_3) \nabla u_n \cdot \nabla u_n \, dx = \int_\Omega \sigma_n(h) \nabla u_n \cdot \nabla u_n \, dx.
\]
By the Poincaré inequality, the previous inequality and (4.4) lead us to
\[
||u_n||_{H_0^1(\Omega)}^2 \leq C||\nabla u_n||_{L^2(\Omega)}^2 \leq C ||f, u_n||_{H^{-1}(\Omega), H_0^1(\Omega)} \leq C ||f||_{H^{-1}(\Omega)} ||u_n||_{H_0^1(\Omega)}
\]
and then to
\[
||u_n||_{H_0^1(\Omega)} \leq C ||f||_{H^{-1}(\Omega)}.
\]
Thus, up to a subsequence still denoted by \( n, u_n \) converges weakly to some function \( u \) in \( H_0^1(\Omega) \).

First step: Weak-* convergence in \( \mathcal{M}(\Omega) \) of the conductivity in the fibers \( \mathbf{1}_{\Omega,n}(\alpha_{2,n} I_3 + \beta_{2,n} \sigma(h)) \nabla u_n \). We proceed as in [22] with a suitable oscillating test function. For \( R \in (0, 1/2) \), define the \( Y \)-periodic (independent of \( y_3 \)) function \( V_n \) by
\[
V_n(y_1, y_2, y_3) = \begin{cases} 
\frac{1}{\ln R - \ln \sqrt{y_1^2 + y_2^2}} & \text{if } \sqrt{y_1^2 + y_2^2} \leq r_n \\
\frac{1}{\ln R - \ln r_n} & \text{if } r_n \leq \sqrt{y_1^2 + y_2^2} \leq R \\
0 & \text{if } \sqrt{y_1^2 + y_2^2} \geq R,
\end{cases}
\]
and the rescaled function
\[
v_n(x) = V_n \left( \frac{x}{\varepsilon_n} \right), \quad x \in \mathbb{R}^3.
\]
In particular, by using the cylindrical coordinates and the fact that \( r_n \) converges to 0, this function satisfies the inequalities
\[
||v_n||_{L^2(\Omega)}^2 \leq C ||V_n||_{L^2(Y)}^2 = C \left| \ln \frac{R}{r_n} \right|^{-2} \left( \pi r_n^2 + \int_0^{2\pi} \int_{r_n}^R \frac{R}{r} \ln \frac{R}{r} \, dr \, d\theta \right)
\]
\[
\leq C \left| \ln \frac{R}{r_n} \right|^{-2} \left( \pi R^2 - r_n^2 - \pi \ln \frac{R}{r_n} \right) \leq C \left| \ln \frac{R}{r_n} \right|^{-2},
\]
\[
||\nabla v_n||_{L^2(\Omega)}^2 \leq C \varepsilon_n ||\nabla V_n||_{L^2(Y)}^2 = C \varepsilon_n \left| \ln \frac{R}{r_n} \right|^{-2} \int_0^{2\pi} \int_{r_n}^R \frac{1}{r} \, dr \, d\theta \leq C \varepsilon_n \left| \ln \frac{R}{r_n} \right|^{-1}
\]
and, consequently
\[
\|v_n\|_{L^2(\Omega)} + \varepsilon_n \|\nabla v_n\|_{L^2(\Omega)^3} \leq C \sqrt{\frac{\ln R}{r_n}} \xrightarrow{n \to \infty} 0. \tag{4.9}
\]

Let $\lambda$ be a vector in $\mathbb{R}^3$ perpendicular to the $x_3$-axis. Define the $Y$-periodic function $\tilde{X}_n$ by $\nabla \tilde{X}_n = \lambda$ in $\omega_n$, such that $X_n \in \mathcal{D}(Y)$ and is $Y$-periodic, and the rescaled function $\hat{X}_n$ by
\[
X_n(x) = \varepsilon_n \tilde{X}_n \left( \frac{x}{\varepsilon_n} \right). \tag{4.10}
\]
In particular, $X_n$ satisfies
\[
\|X_n\|_{\infty} = \varepsilon_n \|\tilde{X}_n\|_{\infty} \leq C \varepsilon_n \quad \|\nabla X_n\|_{\infty} = \|\nabla \tilde{X}_n\|_{\infty} \leq C \quad \text{and} \quad \nabla X_n = \lambda \quad \text{in} \quad \Omega_n. \tag{4.11}
\]
We have, by (4.11) and (4.9),
\[
\|v_n X_n\|_{H^1(\Omega)} \leq \|X_n\|_{\infty} \|v_n\|_{L^2(\Omega)} + \|X_n\|_{\infty} \|\nabla v_n\|_{L^2(\Omega)^3} + \|\nabla X_n\|_{\infty} \|v_n\|_{L^2(\Omega)} \\
\leq C (\|v_n\|_{L^2(\Omega)} + \varepsilon_n \|\nabla v_n\|_{L^2(\Omega)^3}) \xrightarrow{n \to \infty} 0,
\]
which gives
\[
\forall \varphi \in \mathcal{D}(\Omega), \quad \varphi \cdot v_n X_n \xrightarrow{n \to \infty} 0 \quad \text{strongly in} \quad H^1_0(\Omega). \tag{4.12}
\]
Let $\varphi \in \mathcal{D}(\Omega)$. By the strong convergence (4.12), we have
\[
\int_{\Omega} \sigma_n(h) \nabla u_n \cdot \nabla (\varphi \cdot v_n X_n) \, dx = \langle f, \varphi \cdot v_n X_n \rangle_{H^{-1}(\Omega), H^1_0(\Omega)} \xrightarrow{n \to \infty} 0. \tag{4.13}
\]
Let us decompose this integral which converges to 0, into the integral on the fibers set $\Omega_n$ and the integral on its complementary:
\[
\int_{\Omega} \sigma_n(h) \nabla u_n \cdot \nabla (\varphi \cdot v_n X_n) \, dx = \int_{\Omega \setminus \Omega_n} (\alpha_1 I_3 + \beta_1 \varepsilon(h)) \nabla u_n \cdot \nabla (\varphi \cdot v_n X_n) \, dx \tag{4.14a}
\]
\[
\quad + \int_{\Omega_n} (\alpha_2 I_3 + \beta_2 \varepsilon(h)) \nabla u_n \cdot \nabla (\varphi \cdot v_n X_n) \, dx. \tag{4.14b}
\]
The expression (4.14a) converges to 0 since, by the Cauchy-Schwarz inequality, the boundedness of $u_n$ in $H^1_0(\Omega)$ and (4.12), we have
\[
\left| \int_{\Omega \setminus \Omega_n} (\alpha_1 I_3 + \beta_1 \varepsilon(h)) \nabla u_n \cdot \nabla (\varphi \cdot v_n X_n) \, dx \right| \leq \|\alpha_1 I_3 + \beta_1 \varepsilon(h)\|_{L^2(\Omega)^3} \|\nabla u_n\|_{L^2(\Omega)^3} \|\varphi \cdot v_n X_n\|_{H^1_0(\Omega)} \xrightarrow{n \to \infty} 0. \tag{4.15}
\]
Consequently, as $v_n = 1$ and $\nabla X_n = \lambda$ on $\Omega_n$, by (4.13), (4.14a), (4.14b) and (4.15), we have
\[
\int_{\Omega_n} \sigma_n(h) \nabla u_n \cdot \lambda \, dx + \int_{\Omega_n} \sigma_n(h) \nabla u_n \cdot \nabla \varphi \cdot X_n \, dx \xrightarrow{n \to \infty} 0. \tag{4.16}
\]
To prove the convergence to 0 of the right term, we now show that $\mathbf{1}_{\Omega_n} (\alpha_2 I_3 + \beta_2 \varepsilon(h)) \nabla u_n$ is bounded in $L^1(\Omega)^3$. We have, by the Cauchy-Schwarz inequality, (4.5) and the classical equivalent $|\Omega_n| \xrightarrow{n \to \infty} |\Omega|$, $|\omega_n|$,}
\[
\left( \int_{\Omega_n} \left| (\alpha_2 I_3 + \beta_2 \varepsilon(h)) \nabla u_n \right|^2 \, dx \right)^{\frac{1}{2}} \leq \|I_3 + \alpha_2 I_3 \beta_2 \varepsilon(h)\|_{L^2(\Omega)^3} |\Omega_n| \alpha_2 I_3 \int_{\Omega_n} \alpha_2 \varepsilon |\nabla u_n|^2 \, dx \\
\leq C \int_{\Omega} \sigma_n(h) \nabla u_n \cdot \nabla u_n \, dx \\
\leq C \|f\|_{H^{-1}(\Omega)} \|u_n\|_{H^1_0(\Omega)}.
\]
This combined with the boundedness of $u_n$ in $H^1_0(\Omega)$ implies that $\nabla u_n$ is bounded in $L^1(\Omega)^3$. This bound and the uniform convergence to 0 of $X_n$ (see (4.11)) imply the convergence to 0 of the right term of (4.16), hence

$$\int_{\Omega_n} (\alpha_2 n I_3 + \beta_2 n \epsilon(h)) \nabla u_n \cdot \lambda \varphi \, dx \underset{n \to \infty}{\longrightarrow} 0.$$ 

We rewrite this condition as

$$\forall \lambda \perp e_3, \quad \int_{\Omega_n} (\alpha_2 n I_3 + \beta_2 n \epsilon(h)) \nabla u_n \cdot \lambda \rightarrow 0 \quad \text{weakly-}^* \text{ in } \mathcal{M}(\Omega). \quad (4.17)$$

**Second step:** Linear relations between weak-* limits of $\frac{\int_{\Omega_n} \partial u_n}{|\omega_n|} \frac{\partial}{\partial x_i}.$

Thanks to the Cauchy-Schwarz inequality, we have

$$\left\| \frac{\int_{\Omega_n} \partial u_n}{|\omega_n|} \frac{\partial}{\partial x_i} \right\|_{L^1(\Omega)} \leq \frac{1}{|\omega_n|} \int_{\Omega_n} |\nabla u_n| \, dx \leq \frac{1}{\sqrt{\alpha_2 n} |\omega_n|} \sqrt{\int_{\Omega_n} \alpha_2 n |\nabla u_n|^2 \, dx}$$

which leads us, by (4.5) and the asymptotic behavior $|\Omega_n| \sim |\Omega| |\omega_n|$, to

$$\left\| \frac{\int_{\Omega_n} \partial u_n}{|\omega_n|} \frac{\partial}{\partial x_i} \right\|_{L^1(\Omega)} \leq \frac{C}{\sqrt{\alpha_2 n} |\omega_n|} \int_{\Omega} \sigma_n(h) \nabla u_n \cdot \nabla u_n \, dx \leq C \langle f, u_n \rangle_{H^{-1}(\Omega), H^1(\Omega)}$$

which is bounded by the boundedness of $u_n$ in $H^1_0(\Omega)$. This allows us to define, up to a subsequence, the following limits

$$\frac{\int_{\Omega_n} \partial u_n}{|\omega_n|} \frac{\partial}{\partial x_i} \rightarrow \xi_i \quad \text{weakly-}^* \text{ in } \mathcal{M}(\Omega), \quad \text{for } i = 1, 2, 3. \quad (4.18)$$

Then, by (4.17) we have

$$(\alpha_2 n I_3 + \beta_2 n \epsilon(h)) \int_{\Omega_n} \nabla u_n \cdot \lambda = (\alpha_2 n |\omega_n| I_3 + \beta_2 n |\omega_n| \epsilon(h)) \frac{\int_{\Omega_n} \partial u_n}{|\omega_n|} \frac{\partial}{\partial x_i} \nabla u_n \cdot \lambda \rightarrow 0 \quad \text{weakly-}^* \text{ in } \mathcal{M}(\Omega).$$

Therefore, putting $\lambda = e_1, e_2$ in this inequality and using condition (4.5), we obtain the linear system

$$\begin{cases}
\alpha_2 \xi_1 + \beta_2 h_2 \xi_3 - \beta_2 h_3 \xi_2 = 0 \\
\alpha_2 \xi_2 + \beta_2 h_3 \xi_1 - \beta_2 h_1 \xi_3 = 0
\end{cases} \quad \text{in } \mathcal{M}(\Omega),$$

which is equivalent to

$$\begin{cases}
\xi_1 = \frac{\beta_2^2 h_1 h_3 - \alpha_2 \beta_2 h_2}{\alpha_2^2 + \beta_2^2 h_3^2} \xi_3 \\
\xi_2 = \frac{\beta_2^2 h_2 h_3 + \alpha_2 \beta_2 h_1}{\alpha_2^2 + \beta_2^2 h_3^2} \xi_3
\end{cases} \quad \text{in } \mathcal{M}(\Omega). \quad (4.19)$$

**Third step:** Proof of $\xi_3 = \frac{\partial u}{\partial x_3}$.

We need the following result which is an extension of the estimate (3.13) of [21]. The statement of this lemma is more general than necessary for our purpose but is linked to Remark 4.1.

**Lemma 4.1** Let $Q$ be a non-empty connected open subset of the unit disk $D$. Then, there exists a constant $C > 0$ such that any function $U \in H^1(Y)$ satisfies the estimate

$$\left| \frac{1}{|r_n Q|} \int_{r_n Q \times (-\frac{1}{2}, \frac{1}{2})} U \, dy - \int_Y U \, dy \right| \leq C \sqrt{\ln r_n} \|\nabla U\|_{L^2(Y)^3}. \quad (4.20)$$
Proof of Lemma 4.1. Let $U \in H^1(\Omega)$. To prove Lemma 4.1, we compare the average value of $U$ on $r_n Q$ and $r_n D$. Denoting $\tilde{y} = (y_1, y_2)$, we have, for any $y_3 \in (-\frac{1}{2}, \frac{1}{2})$,

$$\left| \int_{r_n Q} U(\tilde{y}, y_3) \, d\tilde{y} - \int_{r_n D} U(\tilde{y}, y_3) \, d\tilde{y} \right| = \left| \int_Q U(r_n \tilde{y}, y_3) \, d\tilde{y} - \int_D U(r_n \tilde{y}, y_3) \, d\tilde{y} \right| \leq \int_Q U(r_n \tilde{y}, y_3) - \int_D U(r_n \tilde{y}, y_3) \, d\tilde{y},$$

and, since $Q \subset D$,

$$\left| \int_{r_n Q} U(\tilde{y}, y_3) \, d\tilde{y} - \int_{r_n D} U(\tilde{y}, y_3) \, d\tilde{y} \right| \leq \frac{|D|}{|Q|} \int_D U(r_n \tilde{y}, y_3) - \int_D U(r_n \tilde{y}, y_3) \, d\tilde{y}$$

$$\leq C \int_{r_n} \left( \frac{\partial U}{\partial x_1} + \frac{\partial U}{\partial x_2} \right) (r_n \tilde{y}, y_3) \, d\tilde{y}$$

$$= \frac{C}{r_n} \int_{r_n} \left( \frac{\partial U}{\partial x_1} + \frac{\partial U}{\partial x_2} \right) (\tilde{y}, y_3) \, d\tilde{y},$$

the last inequality being a consequence of the Poincaré-Wirtinger inequality. Hence, integrating the previous inequality with respect to $y_3 \in (-\frac{1}{2}, \frac{1}{2})$ and applying the Cauchy-Schwarz inequality, we obtain that

$$\left| \int_{r_n Q \times (-\frac{1}{2}, \frac{1}{2})} U(y) \, dy - \int_{r_n D \times (-\frac{1}{2}, \frac{1}{2})} U(y) \, dy \right| \leq \frac{C}{\pi r_n} \int_{r_n D \times (-\frac{1}{2}, \frac{1}{2})} |\nabla U| (y) \, dy$$

$$\leq C \sqrt{\int_{r_n D \times (-\frac{1}{2}, \frac{1}{2})} |\nabla U|^2 (y) \, dy}$$

$$\leq C ||\nabla U||_{L^2(\Omega)^3},$$

This combined with the estimate (3.13) of [21], i.e. (4.20) for $Q = D$, and the fact that $\sqrt{\ln r_n}$ diverges to $\infty$ give the thesis. \hfill \Box

Let $\varphi \in \mathcal{D}(\Omega)$. A rescaling of (4.20) with $Q = D$ implies the inequality

$$\left| \frac{1}{|\omega_n|} \int_{\Omega_n} u_n \varphi \, dx - \int_{\Omega} u_n \varphi \, dx \right| \leq C \varepsilon_n \sqrt{\ln r_n} ||\nabla (u_n \varphi)||_{L^2(\Omega)^3}.$$

Combining this estimate and the first condition of (4.5) with

$$||\nabla (u_n \varphi)||_{L^2(\Omega)^3} \leq ||\nabla u_n||_{L^2(\Omega)^3} ||\varphi||_\infty + ||u_n||_{L^2(\Omega)} ||\nabla \varphi||_\infty \leq C,$$

it follows that

$$\frac{1}{|\omega_n|} u_n - u_n \rightarrow 0 \text{ in } \mathcal{D}'(\Omega).$$

This convergence does not hold true when $\varepsilon_n^2 |\ln r_n|$ converges to some positive constant. Under this critical regime, non-local effects appear (see Remark 4.4).

Finally, as $I_{\Omega_n}$ does not depend on the $x_3$ variable, we have

$$\frac{I_{\Omega_n}}{|\omega_n|} \frac{\partial u_n}{\partial x_3} = \frac{\partial}{\partial x_3} \left( \frac{I_{\Omega_n}}{|\omega_n|} u_n \right) + \frac{\partial}{\partial x_3} \left( \frac{I_{\Omega_n}}{|\omega_n|} (u_n - u_n) \right) = \frac{\partial}{\partial x_3} \left( \frac{I_{\Omega_n}}{|\omega_n|} u_n \right) + \frac{\partial}{\partial x_3} = \xi_3 \text{ in } \mathcal{D}'(\Omega).$$

Fourth step: Derivation of the homogenized matrix.
We now study the limit of $\sigma_n(h) \nabla u_n$ in order to obtain $\sigma_*(h)$. We have
\[
\sigma_n(h) \nabla u_n \cdot e_1 = \mathbb{I}_{\Omega \setminus \Omega_n} \left( \alpha_1 \frac{\partial u_n}{\partial x_1} - \beta_1 h_3 \frac{\partial u_n}{\partial x_2} + \beta_1 h_1 \frac{\partial u_n}{\partial x_3} \right) \\
+ \alpha_{2,n} \frac{\partial u_n}{\omega_n} \frac{\partial u_n}{\partial x_1} - \beta_{2,n} h_3 \frac{\partial u_n}{\partial x_2} + \beta_{2,n} h_2 \frac{\partial u_n}{\partial x_3} \right)
\]
(4.21)

Hence, passing to the weak-* limit in $\mathcal{M}(\Omega)$ this equality and using the linear system (4.19), $\sigma_n(h) \nabla u_n \cdot e_1$ weakly-* converges in $\mathcal{M}(\Omega)$ to
\[
\left( \alpha_1 \frac{\partial u}{\partial x_1} - \beta_1 h_3 \frac{\partial u}{\partial x_2} + \beta_1 h_1 \frac{\partial u}{\partial x_3} \right) + \alpha_2 \xi_1 - \beta_2 h_3 \xi_2 + \beta_2 h_2 \xi_3 \\
= (\alpha_1 I_3 + \beta_1 \mathcal{E}(h)) \nabla u \cdot e_1 + \alpha_2 \frac{\beta_2^2 h_1 h_3 - \alpha_2 \beta_2 h_2}{\alpha_2^2 + \beta_2^2 h_3^2} \xi_3 - \beta_2 h_3 \frac{\beta_2^2 h_2 h_3 + \alpha_2 \beta_2 h_1}{\alpha_2^2 + \beta_2^2 h_3^2} \xi_3 + \beta_2 h_2 \xi_3 \\
= (\alpha_1 I_3 + \beta_1 \mathcal{E}(h)) \nabla u \cdot e_1 + \frac{\alpha_2 (\beta_2^2 h_1 h_3 - \alpha_2 \beta_2 h_2) - \beta_2 h_3 (\beta_2^2 h_2 h_3 + \alpha_2 \beta_2 h_1) + \beta_2 h_2 (\alpha_2^2 \beta_2 h_2^2 h_3)}{\alpha_2^2 + \beta_2^2 h_3^2} \xi_3,
\]
that is
\[
\sigma_n(h) \nabla u_n \cdot e_1 \rightarrow (\alpha_1 I_3 + \beta_1 \mathcal{E}(h)) \nabla u \cdot e_1 \quad \text{weakly-* in } \mathcal{M}(\Omega).
\]
(4.22)

The same calculus leads us to
\[
\sigma_n(h) \nabla u_n \cdot e_2 \rightarrow (\alpha_1 I_3 + \beta_1 \mathcal{E}(h)) \nabla u \cdot e_2 \quad \text{weakly-* in } \mathcal{M}(\Omega).
\]
(4.23)

We have, for the last direction $e_3$,
\[
\sigma_n(h) \nabla u_n \cdot e_3 \rightarrow \left( \alpha_1 \frac{\partial u}{\partial x_3} - \beta_1 h_2 \frac{\partial u}{\partial x_1} + \beta_1 h_1 \frac{\partial u}{\partial x_2} \right) + \alpha_2 \xi_3 + \beta_2 h_2 \xi_1 - \beta_2 h_1 \xi_2 \quad \text{weakly-* in } \mathcal{M}(\Omega).
\]

Hence, again with the linear system (4.19),
\[
\left( \alpha_1 \frac{\partial u}{\partial x_3} - \beta_1 h_2 \frac{\partial u}{\partial x_1} + \beta_1 h_1 \frac{\partial u}{\partial x_2} \right) + \alpha_2 \xi_3 - \beta_2 h_2 \xi_1 + \beta_2 h_1 \xi_2 \\
= (\alpha_1 I_3 + \beta_1 \mathcal{E}(h)) \nabla u \cdot e_3 + \alpha_2 \xi_3 - \beta_2 h_2 \frac{\beta_2^2 h_1 h_3 - \alpha_2 \beta_2 h_2}{\alpha_2^2 + \beta_2^2 h_3^2} \xi_3 + \beta_2 h_1 \frac{\beta_2^2 h_2 h_3 + \alpha_2 \beta_2 h_1}{\alpha_2^2 + \beta_2^2 h_3^2} \xi_3.
\]

Finally, by the previous equality, (4.22) and (4.23), we get that
\[
\sigma_*(h) = \alpha_1 I_3 + \left( \frac{\alpha_2^2 + \beta_2^2 h_3^2}{\alpha_2^2 + \beta_2^2 h_3^2} \right) e_3 \otimes e_3 + \beta_1 \mathcal{E}(h).
\]
□

Acknowledgments: The authors wish to thank the referees for suggestions which led to improvement.
