Abstract: Molecular sieves have been found to promote a new fast, environmentally friendly and experimentally simple multicomponent domino reaction from 1,3-dicarbonyls for the synthesis of pyrrolopiperazine and azasteroid-like scaffolds, of potential synthetic and biological interests.

Key words: multicomponent reaction, atom economy, pyrrolopiperazine, 1,3-dicarbonyls, molecular sieves, heterogeneous catalysis.

In modern organic chemistry, the development of new, rapid, selective, environmentally friendly, step- and atom-economical synthetic routes toward focused libraries of functionalized heterocyclic building blocks is of great importance to both medicinal and synthetic chemists, and still constitutes a challenge from academic and industrial points of view. Although the “ideal synthesis” is unlikely to be achieved routinely, multicomponent reactions (MCRs) involving domino processes, with at least three different simple substrates reacting in a well-defined manner to form a single compound, emerged as a powerful tool in target-oriented synthesis.

In addition, these transformations can be efficiently mediated by heterogeneous catalysts, making this process nearly ideal in terms of both greenness and simplicity. Herein we present the direct, high-yielding one-pot conversion of simple 1,3-dicarbonyl compounds 1 into pyrrolopiperazine scaffolds 4 promoted by 4Å molecular sieves (MS). The presence of the 1,2,3,4-tetrahydropyrrolo[1,2-a]pyrazine core is of interest for both biological and synthetic purposes. Compounds with a related structure are found in some families of naturally occurring marine alkaloids which have been the centre of much recent attention. Alternatively, related synthetic pyrazine nuclei are known to present a large spectrum of biological activities.

The success of our approach is based on the production, under heterogeneous catalysis by MS, of functionalised iminium ions and their selective in situ trapping. Following this concept, we have now designed a new domino reaction forming two C-C bonds from 1,3-dicarbonyl 1, a Michael acceptor 2 and a functionalized pyrrole 3. As outlined in scheme 1, the sequence involves four different reactions in an ordered manner i.e. Michael addition, aldime formation, nucleophilic addition leading to an ene-iminium intermediate, and a Pictet-Spengler-type cyclisation. This new operationally simple strategy is amenable to the highly efficient one-pot construction of pyrrolopiperazine scaffolds of type 4.

The scope of this novel MCR was examined using various acyclic and cyclic 1,3-dicarbonyls (1a-i, Scheme 2). According to our designed strategy, a range of polyheterocyclic compounds were synthesized in good to excellent yields (4a-i, Scheme 3) by simply heating a toluene solution of 1,3-dicarbonyl compound 1, acrolein 2 and 1-(2-aminoethyl)-pyrrole 3, in the presence of 4Å MS.

Scheme 1

Scheme 2

Under these neutral heterogeneous conditions, the overall sequence proved to be of general applicability.
and products 4 were obtained, by a simple filtration through a short pad of Celite, with generally very high chemical purity.16

\[
R^1 \quad R^2 \\
4a: R^1 = Me, R^2 = OEt, 80\% \\
4b: R^1 = Et, R^2 = OMe, 92\% \\
4c: R^1 = Ph, R^2 = OEt, 82\% \\
4d: R^1 = R^2 = Me, 94\%
\]

**Scheme 3**

All the products are highly functionalized scaffolds which present many synthetic opportunities. Acyclic \(\beta\)-ketoesters 1a-c or \(\beta\)-diketone 1d led to the formation of tricyclic derivatives 4a-d in very good yields (Scheme 3), and cyclic \(\beta\)-ketoesters 1e-g gave the expected tetracyclic analogues obtained as a mixture of two diastereomers, in which prevails a 1,4-\(trans\) relationship between the ester function and the proton of the piperazine ring junction.17 In this latter case, the sequence afforded products with a steroid-like skeleton, bearing two (4f) or three (4h) nitrogen atoms starting from six-membered ring \(\beta\)-ketoesters 1f or 1h. Introduction of other heteroatom such as sulfur was also possible. Indeed, \(\beta\)-ketoester 1g gave tetracyclic compound 4g in 77\% yield as a mixture of two diastereomers in a 2:1 \(trans/cis\) ratio. Interestingly enough, piperidone 1h, gave the expected product 4h as a single 1,4-\(trans\) diastereomer in 98\% yield.18 Although NMR analysis17 was in agreement with the proposed structure, we were able to obtain single crystals by slow evaporation of the solvent, which allowed its study by X-ray diffraction (Figure 1)19 and unequivocally established the structural elucidation and the relative 1,4-\(trans\) stereochemistry. Finally, cyclic 1,3-diketone 1i led also to the expected tetracyclic azasteroid-like product 4i in good yield.

**Figure 1**

From a mechanistic point of view, various reaction pathways are possible by mixing the three starting materials. However, based on the successful reactivity of independently prepared Michael adduct 5h towards 1-(2-aminoethyl)-pyrrole15 3 under the standard reaction conditions, we may consider that the first step of the sequence is a MS promoted Michael addition of the 1,3-dicarbonyl compounds with acrolein to give adducts 5 (Scheme 1).20 Then, the formation of the ene-iminium intermediate 7 may occur via nucleophilic addition of the corresponding aldimine 6, followed by the terminal Pictet-Spengler-type cyclisation to provide, after rearomatization, the final product 4. Thus, the formation of one single compound is observed during this new multicomponent domino reaction which constitutes the first highly efficient one-pot route to piperazine scaffolds having an azasteroid-type21 core. The sequence involves formation of two new cycles, five novel bonds including two C-C bonds, and up to four stereogenic centers from simple achiral substrates. Moreover, water is the only byproduct and is easily trapped in situ by MS, which not only act as dehydrating agent, but also as heterogeneous catalyst for the Michael addition.22

In conclusion, we present a novel fast, environmentally friendly and experimentally simple multicomponent domino reaction for the synthesis of polyheterocyclic structures of potential synthetic and biological interests. To our knowledge, this strategy constitutes the first direct one-pot access to pyrrolopiperazine and azasteroid-like scaffolds, from simple and readily accessible substrates. The sequence does not require any harmful reagents, and liberates water as the only by-product. This novel methodology involving heterogeneous catalysis by 4Å MS should be a good complement in the field of heterocyclic chemistry.
Acknowledgment. We would like to thank the CNRS and the Conseil Régional PACA for providing a doctoral fellowship to F. L-M. We are also particularly grateful to Dr. Hugues Bienaymé (Pierre Fabre Urologie) for his support and fruitful discussions, to Dr. M. Giorgi for X-rays analysis and Dr. R. Faure for NMR analysis and interpretations.

(16) Typical Procedure for the synthesis of compounds 4: To a 50 mL two-necked round bottom flask flushed with Ar, equipped with a magnetic stirring bar and a reflux condenser, were added toluene freshly distilled over CaH2 (25 mL), commercially available inactivated 4Å MS (6 g), diketoester 1 (200 mg, 1.0 equiv.), freshly distilled acrolein 2 (1.2 equiv.), and amine 3 (1.0 equiv.). The heterogeneous mixture was stirred at reflux under Ar for 24h. The solution was filtered through a short pad of Celite, which was thoroughly washed with toluene. The solvent was evaporated under reduced pressure to afford crude compound 4 with good chemical purity. An analytical sample was isolated by flash chromatography over silica gel. Selected physical data for compounds 4h: yellow oil; RF = 0.57 (Petroleum ethers/AcOEt 3:1); 1H NMR (CDCl3, 300.13 MHz) δ 7.23 (5H, m), 6.50 (1H, m), 6.16 (1H, dd, J = 3.6 Hz, J = 2.7 Hz), 5.85 (1H, t, J = 1.5 Hz), 4.90 (1H, dd, J = 4.7 Hz, J = 2.1 Hz), 4.10 (2H, m), 4.03 (1H, m), 3.94 (1H, broad dd, J = 11.6 Hz, J = 3.0 Hz), 3.68 (1H, d, J = 13.3 Hz), 3.58 (1H, dd, J = 11.6 Hz, J = 2.8 Hz), 3.54 (1H, broad dd, J = 12.0 Hz, J = 3.5 Hz), 3.47 (1H, broad dd, J = 15.3 Hz, J = 4.7 Hz), 3.42 (1H, d, J = 13.3 Hz), 3.10 (1H, dd, J = 11.2 Hz, J = 1.2 Hz), 2.92 (1H, td, J = 11.9 Hz, J = 4.1 Hz), 2.91 (1H, dd, J = 15.3 Hz, J = 2.0 Hz), 2.30 (1H, dt, J = 13.0 Hz, J = 3.1 Hz), 2.19 (1H, d, J = 11.2 Hz), 2.12 (1H, dq, J = 13.5 Hz, J = 3.1 Hz), 1.70 (1H, tdd, J = 13.9 Hz, J = 11.3 Hz, J = 3.3 Hz), 1.48 (1H, td, J = 13.5 Hz, J = 3.6 Hz), 1.13 (3H, t, J = 7.2 Hz); 13C NMR (CDCl3, 75.47 MHz) δ 173.9; 144.2; 138.5; 130.7; 128.5 (2C); 128.0 (2C); 126.8; 118.0; 108.1; 101.7; 101.4; 61.5; 60.6; 60.5; 5.3; 48.8; 45.1; 44.4; 31.2; 28.9; 14.0.

(17) Stereochemistry of the products has been fully studied by 2D NMR analysis which is part of F. Lieby-Muller’s PhD Thesis, and details will be published in due course. Although fully reproducible, the origin of the total diastereoselectivity observed in the case of 1h is not yet clear, and further experiments and calculations are in progress and will be reported in due course.

(19) Crystallographic data for the structure reported in this paper have been deposited with the Cambridge Crystallographic Data Centre as supplementary publication no. CCDC 264343. Copies of the data can be obtained free of charge on application to CCDC, 12 Union Road, Cambridge CB21EZ, UK (fax: (+44) 1223-336-033; e-mail: deposit@ccdc.cam.ac.uk).

(20) Michael adduct 5h has been prepared by reaction of 1h with acrolein 2, in the presence of Dowex resins. When this 1,5-dicarbonyl compound reacts with amine 3, same product 4h is obtained, as in the one-pot sequence.

(22) The presence of MS is crucial since no reaction takes place under simple azetotropic distillation or in the presence of TMOF as dehydrating agent. Moreover, some other heterogeneous catalysts such as basic or acidic alumina, montmorillonite K10 or Dowex ion-exchange resin have been tested in this sequence with very lower efficiency, leading sometimes to decomposition or to the desired product in yields not exceeding 20%.
