Abstract. In this paper, we investigate the following quasilinear elliptic and singular system \((P)\):

\[-\Delta_p u = f_1(x, u, v) \quad \text{in} \quad \Omega; \quad u|_{\partial \Omega} = 0, \quad u > 0 \quad \text{in} \quad \Omega,
-\Delta_q v = f_2(x, u, v) \quad \text{in} \quad \Omega; \quad v|_{\partial \Omega} = 0, \quad v > 0 \quad \text{in} \quad \Omega,\]

where \(\Omega\) is a bounded domain with smooth boundary in \(\mathbb{R}^N\), \(1 < p, q < \infty\) and \(f_1, f_2 \in C^1(\Omega \times \mathbb{R}_+^* \times \mathbb{R}_+^*)\) two positive functions. Under suitable conditions on \(f_1\) and \(f_2\), we first give a general result on the existence of positive weak solutions pairs \((u, v)\) \(\in W_{0}^{1,p}(\Omega) \times W_{0}^{1,q}(\Omega)\) to \((P)\). Next, we give some applications to Biology.

Keywords. Quasilinear singular elliptic systems, weak comparison principle, sub and super solutions, cone condition, Schauder fixed point Theorem.

2010 Mathematics Subject Classification. 35J35, 35J50, 35R05.

1 Introduction

In this paper we are interested in the following quasilinear elliptic and singular system,

\[(P) \begin{cases}
-\Delta_p u = f_1(x, u, v) & \text{in} \quad \Omega; \quad u|_{\partial \Omega} = 0, \quad u > 0 \quad \text{in} \quad \Omega, \\
-\Delta_q v = f_2(x, u, v) & \text{in} \quad \Omega; \quad v|_{\partial \Omega} = 0, \quad v > 0 \quad \text{in} \quad \Omega.
\end{cases}\]

Here, \(\Omega\) is a bounded domain of \(\mathbb{R}^N\), \(N \geq 2\) with \(C^2\) boundary \(\partial \Omega\), \(\Delta_r u \overset{\text{def}}{=} \text{div}(|\nabla u|^{r-2} \nabla u)\) denotes the \(r\)-Laplace operator and \(1 < p, q < \infty\). In the right-hand sides, \(f_1\) and \(f_2\) are two Carathéodory functions in \(\Omega \times (\mathbb{R}_+^* \times \mathbb{R}_+^*)\) possibly singular. More precisely, for every \((t_1, t_2) \in \mathbb{R}_+^* \times \mathbb{R}_+^*\) and for almost every \(x \in \Omega\), we assume that

\((H_1)\) \quad \(f_1(\cdot, t_1, t_2)\) and \(f_2(\cdot, t_1, t_2)\) are Lebesgue measurable in \(\Omega\),

\((H_2)\) \quad \(f_1(x, \cdot, \cdot)\) and \(f_2(x, \cdot, \cdot)\) are in \(C^1(\mathbb{R}_+^* \times \mathbb{R}_+^*)\).

We aim to establish the existence of a positive weak solutions pair to problem \((P)\) using the Schauder Fixed Point Theorem. Namely, if we can compose two
order-reversing mappings,

\[(u, v) \mapsto T_1(u, v) \overset{\text{def}}{=} \tilde{u} \quad \text{and} \quad (u, v) \mapsto T_2(u, v) \overset{\text{def}}{=} \tilde{v}, \tag{1.1}\]

where \(\tilde{u} \in W^{1,p}_0(\Omega)\) and \(\tilde{v} \in W^{1,q}_0(\Omega)\) are defined to be the (unique) positive weak solution to the Dirichlet problems

\[-\Delta_p \tilde{u} + h_1(x, \tilde{u}) = f_1(x, u, v) + h_1(x, u) \quad \text{in} \quad \Omega; \quad \tilde{u}|_{\partial \Omega} = 0, \quad \tilde{u} > 0 \quad \text{in} \quad \Omega, \tag{1.2}\]

\[-\Delta_q \tilde{v} + h_2(x, \tilde{v}) = f_2(x, u, v) + h_2(x, v) \quad \text{in} \quad \Omega; \quad \tilde{v}|_{\partial \Omega} = 0, \quad \tilde{v} > 0 \quad \text{in} \quad \Omega, \tag{1.3}\]

respectively, in suitable conical shells of positive cones in \(W^{1,p}_0(\Omega)\) and \(W^{1,q}_0(\Omega)\), with appropriate functions \(h_1\) and \(h_2\); then any fixed point of the mapping

\[(u, v) \mapsto T(u, v) \overset{\text{def}}{=} (T_1(u, v), T_2(u, v)) \tag{1.4}\]

is a positive weak solution pair to \((P)\) and conversely. To prove that \(T\) is well defined and invariant in some conical shell, we use monotonicity methods together with the existence of sub- and supersolutions which prescribe the behaviour of the right-hand side singular non-linearities, namely \(f_1\) and \(f_2\), near the boundary \(\partial \Omega\). The continuity and the compactness in \(C^0,\alpha(\Omega) \times C^0,\alpha(\Omega)\) for some suitable \(0 < \alpha < 1\) follow from the regularity result Theorem 1.1 in [11] we recall in the appendix (see Theorem A.1). We derive further uniqueness results in case where the system \((P)\) is competitive or cooperative (see Theorem 3.8). To establish the uniqueness of a positive pair of solutions to \((P)\), it is essential that the mapping \(T\) is subhomogeneous. In the cooperative and "strong" singular case, we also prove the existence of very weak solutions in \(W^{1,p}_{\text{loc}}(\Omega) \times W^{1,q}_{\text{loc}}(\Omega)\) (see Theorem 2.3).

Quasilinear elliptic systems have been quite intensely investigated in the literature with various methods. In [23], the authors take advantage of the variational structure of the problem to apply variational methods. In [3], a blow up argument combined with a Liouville theorem yields universal a priori bounds. Then, the existence of solutions is obtained by a topological degree argument (see also the review article [5]). In [4], the key ingredients to prove existence of solutions are the Strong Comparison Principle and Kreĭn-Rutman theorem for homogeneous non-linear mapping. While dealing with subhomogeneous systems, one usually appeals the method of sub and supersolutions.

Related problems for singular quasilinear systems have been also studied in [16] and [12]. Accordingly, we study in our paper a more general situation that handle more singular cases. We point out additionally that in the present work non-linearities \(f_1\) and \(f_2\) are not necessary non-negative.
The case of singular semi-linear systems \((p = q = 2)\) has been studied even more frequently in [1], [2], [21], [14], [15] and [8]. We refer to [14] for additional references on the subject.

Throughout this paper, we will use the following notations and definitions:

(i) To \(r \in (1, +\infty)\) we associate \(r' \overset{\text{def}}{=} \frac{r}{r-1} > 1\) and we denote by \(W^{-1,r'}(\Omega)\) the dual space of \(W^{1,r}_0(\Omega)\) with respect to the standard inner product in \(L^2(\Omega)\).

(ii) We denote by \(d(x) \overset{\text{def}}{=} \inf_{y \in \partial \Omega} d(x, y)\), the distance from \(x \in \Omega\) to \(\partial \Omega\).

(iii) We denote by \(D \overset{\text{def}}{=} \sup_{x,y \in \Omega} d(x, y)\), the diameter of the domain \(\Omega\).

(iv) Let \(f, g : \Omega \rightarrow [0, +\infty]\) be two functions of \(L^1_{\text{loc}}(\Omega)\). Then, we write
\[
  f(x) \sim g(x) \quad \text{in } \Omega
\]
if there exist two positive constants \(C_1\) and \(C_2\) such that for almost every \(x \in \Omega\),
\[
  C_1 g(x) \leq f(x) \leq C_2 g(x).
\]

(v) The function \(\varphi_{1,r} \in W^{1,r}_0(\Omega)\) denotes the positive and \(L^r\)-renormalized eigenfunction corresponding to the first eigenvalue of \(-\Delta_r\),

\[
  \lambda_{1,r} \overset{\text{def}}{=} \inf \left\{ \int_{\Omega} |\nabla v|^r \, dx \in \mathbb{R}, \quad v \in W^{1,r}_0(\Omega) \quad \text{and} \quad \int_{\Omega} |v|^r \, dx = 1 \right\}.
\]

It is a weak solution of the following eigenvalue problem:

\[
  -\Delta_r w = \lambda_{1,r} w^{r-1} \quad \text{in } \Omega; \quad w|_{\partial \Omega} = 0, \quad w > 0 \quad \text{in } \Omega.
\]

Using Moser iterations, \(\varphi_{1,r} \in L^\infty(\Omega)\) and using the Hölder regularity result in LIEBERMAN [19], \(\varphi_{1,r} \in C^{1,\alpha}(\Omega)\) for some \(0 < \alpha < 1\). Moreover the strong maximum and boundary principles from VÁSQUEZ [24], guarantee that \(\varphi_{1,r}\) satisfies

\[
  \varphi_{1,r}(x) \sim d(x) \quad \text{in } \Omega.
\]

(vi) We say that a Lebesgue measurable function \(f : \Omega \rightarrow \mathbb{R}\) is locally uniformly positive if \(\text{essinf}_K f > 0\) holds over every compact set \(K \subset \Omega\).

(vii) In this paper, we primarily look for positive weak solution pairs (positive solutions, for short) of problem (P), that is, pairs of functions \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) with both \(u\) and \(v\) locally uniformly positive and each satisfying the respective equation in problem (P) in the weak sense. More
precisely, given $1 < r < \infty$ and $f \in W^{-1,r'}(\Omega)$, we say that a function $u \in W^{1,r}(\Omega)$ satisfies the equation

$$-\Delta_r u = f \quad \text{in } \Omega$$

(1.6)

in the weak sense if $u$ is locally uniformly positive and satisfies

$$\forall w \in W_0^{1,r}(\Omega), \quad \int_{\Omega} |\nabla u|^{r-2} \nabla u \cdot \nabla w \, dx = \langle f, w \rangle_{W^{-1,r'}(\Omega) \times W^{1,r}(\Omega)}.$$

In the case where the existence of positive solutions of \((P)\) cannot be established, we discuss the existence of weaker solutions. Then, we say that $(u, v) \in W_{loc}^{1,p}(\Omega) \times W_{loc}^{1,q}(\Omega)$ is a positive very weak solution pair of \((P)\) if both $u$ and $v$ are locally uniformly positive and satisfy the respective equation in problem \((P)\) in the sense of distributions.

In the three last points, for $1 < r < +\infty$, $A_r(\Omega)$ represents the space $W_0^{1,r}(\Omega)$ or the space $W^{1,r}_{loc}(\Omega)$.

(viii) Let $\underline{w}, \overline{w} \in A_r(\Omega)$, two locally uniformly positive functions such that $\underline{w} \leq \overline{w}$ a.e. in $\Omega$. We define the convex set

$$\overline{[\underline{w}, \overline{w}]} \overset{\text{def}}{=} \{ w \in A_r(\Omega) \cap C(\overline{\Omega}), \quad \underline{w} \leq w \leq \overline{w} \quad \text{a.e. in } \Omega \}.$$

(ix) Let $\underline{u}, \overline{u} \in A_p(\Omega)$ and $\underline{v}, \overline{v} \in A_q(\Omega)$ four locally uniformly positive functions such that $\underline{u} \leq \overline{u}$ a.e. in $\Omega$ and $\underline{v} \leq \overline{v}$ a.e. in $\Omega$. The couples $(\underline{u}, \underline{v})$ and $(\overline{u}, \overline{v})$ are said to be sub and supersolutions pairs to \((P)\) if the following inequalities are satisfied in the distribution sense

$$-\Delta_p \underline{u} \leq f_1(x, \underline{u}, \underline{v}) \quad \text{in } \Omega, \quad \text{for any } v \in [\underline{v}, \overline{v}],$$

(1.7)

$$-\Delta_q \underline{u} \leq f_2(x, \underline{u}, \underline{v}) \quad \text{in } \Omega, \quad \text{for any } u \in [\underline{u}, \overline{u}],$$

(1.8)

$$-\Delta_p \overline{u} \geq f_1(x, \overline{u}, \overline{v}) \quad \text{in } \Omega, \quad \text{for any } v \in [\underline{v}, \overline{v}],$$

(1.9)

$$-\Delta_q \overline{u} \geq f_2(x, \overline{u}, \overline{v}) \quad \text{in } \Omega, \quad \text{for any } u \in [\underline{u}, \overline{u}].$$

(1.10)

(x) Let $(\underline{u}, \underline{v}), (\overline{u}, \overline{v}) \in A_p(\Omega) \times A_q(\Omega)$ be respectively sub and supersolutions pairs to \((P)\). Then, the conical shell $[\underline{u}, \overline{u}] \times [\underline{v}, \overline{v}]$ is denoted by $\mathcal{C}$.

The paper is organised as follows. The next section (Section 2) contains the statements and the proofs of our main results (Theorems 2.1 and Theorems 2.3). Different applications of Theorems 2.1 and 2.3 arising in population dynamics models are given in Section 3. The appendix contains the regularity result (Theorem A.1) used to prove Hölder continuity of solutions. Theorem A.1 is proved in [11].
2 General results

Theorem 2.1. Let \((u, v), (\overline{u}, \overline{v}) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) be sub and supersolutions pairs to \((P)\) and assume in addition that the following conditions hold:

(i) there exist constants \(k_1, k_2 > 0\) and \(\delta_1, \delta_2 \in \mathbb{R}\) such that
\[
|f_1(x, u, v)| \leq k_1 d(x)^{\delta_1} \quad \text{and} \quad |f_2(x, u, v)| \leq k_2 d(x)^{\delta_2} \quad \text{in} \ \Omega \times \mathcal{C}, \tag{2.1}
\]

(ii) there exist constants \(C_1, C_2 > 0\) and \(b_1, b_2 > 0\) such that
\[
\overline{u} \leq C_1 d(x)^{b_1} \quad \text{and} \quad \overline{v} \leq C_2 d(x)^{b_2} \quad \text{in} \ \Omega, \tag{2.2}
\]

(iii) and there exist \(\kappa_1, \kappa_2 > 0\) and \(\alpha_1, \alpha_2 > 0\) such that
\[
\left| \frac{\partial f_1}{\partial u}(x, u, v) \right| \leq \kappa_1 d(x)^{\delta_1 - \alpha_1} \quad \text{in} \ \Omega \times \mathcal{C}, \tag{2.3}
\]
\[
\left| \frac{\partial f_2}{\partial v}(x, u, v) \right| \leq \kappa_2 d(x)^{\delta_2 - \alpha_2} \quad \text{in} \ \Omega \times \mathcal{C}, \tag{2.4}
\]

with the following conditions on the coefficients
\[
\delta_1 > -2 + \frac{1}{p} + (\alpha_1 - b_1)^+, \quad \delta_2 > -2 + \frac{1}{q} + (\alpha_2 - b_2)^+. \tag{2.5}
\]

Then, there exists a positive weak solutions pair \((u, v) \in \mathcal{C}\).

Remark 2.2. Instead of conditions (2.3) and (2.4), as in [12], we can rather suppose that there exist \(\kappa_1, \kappa_2 > 0\) and \(\alpha_1, \alpha_2 > 0\) such that for all \((u, v) \in \mathcal{C}\),
\[
w \mapsto f_1(x, w, v) + \kappa_1 d(x)^{\delta_1 - \alpha_1} w^{p-1} \text{ is non decreasing on } [u, \overline{u}],
\]
\[
w \mapsto f_2(x, u, w) + \kappa_2 d(x)^{\delta_2 - \alpha_2} w^{q-1} \text{ is non decreasing on } [v, \overline{v}].
\]

Replacing condition (2.5) by
\[
\delta_1 > -2 - \frac{1}{p} + (\alpha_1 - (p - 1)b_1)^+, \quad \delta_2 > -2 + \frac{1}{q} + (\alpha_2 - (q - 1)b_2)^+,
\]
we get the same result and the condition is sharper if \(p, q > 2\). For that, it suffices to replace the first equation of the problem \((Q)\), given below, by
\[
-\Delta_p w + \tilde{g}_1(x, w) = f_1(x, u, v) + \kappa_1 d(x)^{\delta_1 - \alpha_1} w^{p-1} \quad \text{in} \ \Omega,
\]
with \( g_1 : \Omega \times \mathbb{R} \to \mathbb{R}^*_+ \) the cut-off function defined as follows:

\[
g_1(x, z) \overset{\text{def}}{=} \begin{cases} \kappa_1 d(x)^{\delta_1-\alpha_1}\bar{u}^{p-1} & \text{if } z \geq \bar{u}(x), \\ \kappa_1 d(x)^{\delta_1-\alpha_1}z^{p-1} & \text{if } z \in [0, \bar{u}(x)], \\ 0 & \text{if } z \leq 0. \end{cases}
\]

(2.6)

and proceed similarly for the second equation of \( (P) \).

**Proof.** Let \((u, v) \in \mathcal{C}\). We first prove the existence of \( T_1(u, v) \in W_0^{1,p}(\Omega) \), where \( T_1(u, v) \) is defined in (1.2) with \( h_1(x, u) \overset{\text{def}}{=} \kappa_1 d(x)^{\delta_1-\alpha_1}u \) in \( \Omega \times [u, \pi] \). For that, let us introduce the following problem :

\[
(Q) \begin{cases} -\Delta_p w + g_1(x, w) = f_1(x, u, v) + \kappa_1 d(x)^{\delta_1-\alpha_1}u & \text{in } \Omega, \\ w|_{\partial\Omega} = 0, \hspace{0.5cm} w > 0 & \text{in } \Omega, \end{cases}
\]

with \( g_1 : \Omega \times \mathbb{R} \to \mathbb{R}^*_+ \) the cut-off function defined as follows:

\[
g_1(x, z) \overset{\text{def}}{=} \begin{cases} \kappa_1 d(x)^{\delta_1-\alpha_1}\bar{u} & \text{if } z \geq \bar{u}(x), \\ \kappa_1 d(x)^{\delta_1-\alpha_1}z & \text{if } z \in [0, \bar{u}(x)], \\ 0 & \text{if } z \leq 0. \end{cases}
\]

(2.7)

Then, \( g_1 \) is a Carathéodory function on \( \Omega \times \mathbb{R} \). Thus, for \((x, s) \in \Omega \times \mathbb{R}\), setting \( G_1(x, s) \overset{\text{def}}{=} \int_0^s g_1(x, z)dz \), we consider the following functional: \( \forall w \in W_0^{1,p}(\Omega) \),

\[
E(w) \overset{\text{def}}{=} \frac{1}{p} \int_\Omega |\nabla w|^p \, dx + \int_\Omega G_1(x, w) \, dx - \int_\Omega \left( f_1(x, u, v) + \kappa_1 d(x)^{\delta_1-\alpha_1}u \right) w \, dx.
\]

By assumption (2.5) and Hardy’s inequality, \( E \) is well defined in \( W_0^{1,p}(\Omega) \) and for all \( w \in W_0^{1,p}(\Omega) \),

\[
E(w) \geq \frac{1}{p} \|w\|_{W_0^{1,p}(\Omega)}^p - C \| (f_1(x, u, v) + \kappa_1 d(x)^{\delta_1-\alpha_1}u) \|_{L^{p'}(\Omega)} \|w\|_{W_0^{1,p}(\Omega)}.
\]

(2.8)

So, let us define

\[
I \overset{\text{def}}{=} \inf_{w \in W_0^{1,p}(\Omega)} E(w)
\]

(2.9)

and let \((w_n)_{n \in \mathbb{N}} \subset W_0^{1,p}(\Omega) \) be a minimizing sequence of \( E \), i.e. \( \lim_{n \to \infty} E(w_n) = I \). Using (2.8), \((w_n)_{n \in \mathbb{N}} \) is bounded in \( W_0^{1,p}(\Omega) \), therefore there exists a subsequence \((w_{n_k})_{k \in \mathbb{N}}\) and \( \bar{u} \in W_0^{1,p}(\Omega) \) such that \( w_{n_k} \rightharpoonup \bar{u} \), weakly in \( W_0^{1,p}(\Omega) \) and a.e. in \( \Omega \). Therefore,

\[
\liminf_{k \to \infty} \|w_{n_k}\|_{W_0^{1,p}(\Omega)} \geq \|\bar{u}\|_{W_0^{1,p}(\Omega)}
\]
and using Fatou’s lemma,

\[ \liminf_{k \to \infty} \int_{\Omega} G_1(x,w_{n_k}) dx \geq \int_{\Omega} \liminf_{k \to \infty} G_1(x,w_{n_k}) dx = \int_{\Omega} G_1(x,\tilde{u}) dx. \]

Hence, \( E(\tilde{u}) = I \) and \( \tilde{u} \) is a solution to the Euler-Lagrange equation associated to \( E_0 \), that is:

\[ \int_{\Omega} |\nabla \tilde{u}|^{p-2} \nabla \tilde{u} \cdot \nabla w dx + \int_{\Omega} g_1(x,\tilde{u}) w dx = \int_{\Omega} \left( f_1(x,u,v) + \kappa_1 d(x)^{\delta_1 - \alpha_1} u \right) w dx, \quad (2.10) \]

for any \( w \in W^{1,p}_0(\Omega) \). Now let us prove that \( \tilde{u} \in [u,\bar{u}] \). Combining (1.7) and (2.10), we get for all \( w \in W^{1,p}_0(\Omega) \),

\[ \int_{\Omega} \left[ |\nabla \tilde{u}|^{p-2} \nabla \tilde{u} - |\nabla u|^{p-2} \nabla u \right] \cdot \nabla w dx + \int_{\Omega} \left( g_1(x,\tilde{u}) - g_1(x,u) \right) w dx \geq \int_{\Omega} \left[ (f_1(x,u,v) + \kappa_1 d(x)^{\delta_1 - \alpha_1} u) - (f_1(x,u,v) + \kappa_1 d(x)^{\delta_1 - \alpha_1} u) \right] w dx. \quad (2.11) \]

By assumption (2.3), applying this inequality with \( w = (\tilde{u} - u)^- \in W^{1,p}_0(\Omega)^+ \), we get \( \tilde{u} \geq u \) a.e. in \( \Omega \). Similarly, combining (1.9) and (2.10) we also get \( \tilde{u} \leq \bar{u} \) a.e. in \( \Omega \). Then, \( \tilde{u} \) satisfies the equation

\[ -\Delta_p \tilde{u} + \kappa_1 d(x)^{\delta_1 - \alpha_1} \tilde{u} = f_1(x,u,v) + \kappa_1 d(x)^{\delta_1 - \alpha_1} u \quad \text{in } \Omega, \quad (2.12) \]

in the weak sense. Moreover, using a classical local regularity result in [22], \( \tilde{u} \in C^{1,\gamma}(K) \) for some \( \gamma > 0 \) in any compact subset \( K \) of \( \Omega \). So using inequality (2.2), \( \tilde{u} \in C(\overline{\Omega}) \), which gives us that \( \tilde{u} \in [u,\bar{u}] \). Finally, by the weak maximum principle, \( \tilde{u} \) is the unique function in the conical shell \( [u,\bar{u}] \) satisfying (2.12). Then, the mapping \( T_1 : (u,v) \mapsto \tilde{u} \) is well-defined from \( C \) to \( [u,\bar{u}] \). In the same spirit, we get the existence of the mapping \( T_2 : (u,v) \mapsto \bar{v} \) defined from \( C \) to \( [\underline{v},\bar{v}] \), where \( \bar{v} \) is the unique weak solution in \( [\underline{v},\bar{v}] \) of

\[ -\Delta_p \bar{v} + \kappa_2 d(x)^{\delta_2 - \alpha_2} \bar{v} = f_2(x,u,v) + \kappa_2 d(x)^{\delta_2 - \alpha_2} v \quad \text{in } \Omega. \quad (2.13) \]

This proves that the operator \( T \) defined in (1.4) is well-defined and makes invariant the conical shell \( C \).

Now, the continuity and the compactness of \( T \) follow from a regularity result in
[11] we recall in appendix A. Indeed, let \((u_n, v_n)_{n \in \mathbb{N}} \subset C\) and \((u, v) \in C\) such that \((u_n, v_n) \to (u, v)\) in \(C(\overline{\Omega}) \times C(\overline{\Omega})\) as \(n \to +\infty\). Then, from Theorem A.1 and assumptions (2.1), \((T_n(u_n, v_n) = \tilde{u}_n)_{n \in \mathbb{N}}\) is bounded in \(C^{0, \alpha}(\overline{\Omega})\), for some \(0 < \alpha < 1\). By Ascoli-Arzelà theorem, there exists a subsequence \((\tilde{u}_{n_k})_{k \in \mathbb{N}}\) and \(\tilde{u} \in [u, \overline{u}]\) such that \(\tilde{u}_{n_k} \to \tilde{u}\) uniformly in \(\overline{\Omega}\) as \(k \to +\infty\). Moreover, using the local regularity result in [22], \((\tilde{u}_{n_k})_{k \in \mathbb{N}}\) is bounded in \(C^{1, \gamma}(K)\) for some \(\gamma > 0\) and for any compact subset \(K\) of \(\overline{\Omega}\) which entails that up to a subsequence denoted again \((\tilde{u}_{n_k})_{k \in \mathbb{N}}\) such that \(\nabla \tilde{u}_{n_k} \to \nabla \tilde{u}\) uniformly in \(K\) as \(k \to +\infty\). Then, \(\tilde{u}\) satisfies

\[
-\Delta_p \tilde{u} + \kappa_1 d(x)^{\delta_1 - \alpha_1} \tilde{u} = f_1(x, u, v) + \kappa_1 d(x)^{\delta_1 - \alpha_1} u \quad \text{in } \Omega \tag{2.14}
\]

in the sense of distributions. Moreover, since \(\tilde{u} \leq \overline{u}\) a.e in \(\Omega\), \(f_1(x, u, v) + \kappa_1 d(x)^{\delta_1 - \alpha_1} (u - \tilde{u}) \in W^{-1, p'}(\Omega)\), which implies that \(\tilde{u} \in W^{1, p'}_0(\Omega)\). Hence \(\tilde{u} \in [u, \overline{u}]\) and is a weak solution of (2.14). By uniqueness of such a solution in \([u, \overline{u}]\), it follows that \(\tilde{u} = T_1(u, v)\) and all the sequence \((\tilde{u}_n)_{n \in \mathbb{N}}\) converges to \(\tilde{u}\) in \(C(\overline{\Omega})\). The same arguments hold to prove that \(T_2(u_n, v_n) \to T_2(u, v)\) uniformly in \(\overline{\Omega}\) as \(n \to +\infty\). Then, \(T : C \to C\) is continuous. Finally, it easy from the compact embedding of \(C^{0, \alpha}(\overline{\Omega})\) in \(C(\overline{\Omega})\) to get the compactness of \(T\). Applying the Schauder Fixed Point Theorem to \(T\) in \(C\), the proof of Theorem 2.1 is now complete.

We now give a more general result which guarantees the existence of a "very weak" positive solutions pair, in the cooperative case, when the inequalities (2.5) may not be satisfied.

**Theorem 2.3.** Assume that \((P)\) is a cooperative system, i.e.

\[
\frac{\partial f_1}{\partial u}(x, u, v) > 0 \quad \text{and} \quad \frac{\partial f_2}{\partial u}(x, u, v) > 0 \quad \text{in } \Omega \times \mathbb{R}^*_+ \times \mathbb{R}^*_+. \tag{2.15}
\]

Let \((u, v), (\overline{u}, \overline{v}) \in [C(\overline{\Omega}) \cap W^{1, p}_{\text{loc}}(\Omega)] \times [C(\overline{\Omega}) \cap W^{1, q}_{\text{loc}}(\Omega)]\) be sub and supersolutions pairs to \((P)\). Assume in addition that the following conditions hold:

(i) there exist constants \(C_1, C_2 > 0\) and \(b_1, b_2 > 0\) such that

\[
\overline{u} \leq C_1 d(x)^{b_1} \quad \text{and} \quad \overline{v} \leq C_2 d(x)^{b_2} \quad \text{in } \Omega, \tag{2.16}
\]

(ii) there exist \(\kappa_1, \kappa_2 > 0\) and \(\delta_1, \delta_2 \in \mathbb{R}\) such that

\[
\left| \frac{\partial f_1}{\partial u}(x, u, v) \right| \leq \kappa_1 d(x)^{\delta_1} \quad \text{and} \quad \left| \frac{\partial f_2}{\partial v}(x, u, v) \right| \leq \kappa_2 d(x)^{\delta_2} \quad \text{in } \Omega \times C. \tag{2.17}
\]
Then, there exists a positive very weak solution pair \((u,v)\) and sequence of smooth subdomains of \(\Omega\) such that \((u,v)\) is a minimum of the functional \(E_1\) defined for \(w \in W^{1,p}(\Omega_1)\) by

\[
E_1(w) \overset{\text{def}}{=} \frac{1}{p} \int_{\Omega_1} |\nabla (w + u)|^p \, dx + \frac{\kappa_1}{2} \int_{\Omega_1} d(x)^{\delta_1} (w + u)^2 \, dx - \int_{\Omega_1} (f_1(x,u,v) + \kappa_1 d(x)^{\delta_1} u) w \, dx.
\]
Since the operator \( u \mapsto -\Delta_p u + \kappa_1 d(x)\delta_1 u \) is monotone in \( W^{1,p}(\Omega_1) \), applying the weak comparison principle we get

\[
u \leq u \leq \overline{u} \quad \text{a.e. in } \Omega_1.
\]

Using the same arguments as above, we prove the existence of \( v_1 \in W^{1,q}(\Omega_1) \) satisfying \( \nu \leq v_1 \leq \overline{v} \) a.e. in \( \Omega_1 \). Now, let us fix \( n \in \mathbb{N}^* \) and suppose that for all \( k \leq n \), \((P_k)\) has a solution \((u_k, v_k) \in W^{1,p}(\Omega_k) \times W^{1,q}(\Omega_k)\) satisfying (2.19). The existence of positive solutions of \((P_{n+1})\), \((u_{n+1}, v_{n+1}) \in W^{1,p}(\Omega_{n+1}) \times W^{1,q}(\Omega_{n+1})\) satisfying

\[
u \leq u_{n+1} \leq \overline{u} \quad \text{and} \quad \nu \leq v_{n+1} \leq \overline{v} \quad \text{a.e. in } \Omega_{n+1},
\]

can be established using similar techniques as above. To prove the monotonicity of the sequences \((\check{u}_m)_{m \in \mathbb{N}^*}\) and \((\check{v}_m)_{m \in \mathbb{N}^*}\), we remark that \( \check{u}_n \in W^{1,p}(\Omega_{n+1}) \) and satisfies

\[-\Delta_p \check{u}_n + \kappa_1 d(x)\delta_1 \check{u}_n \leq f_1(x, \check{u}_{n-1}, \check{v}_{n-1}) + \kappa_1 d(x)\delta_1 \check{u}_{n-1} \quad \text{in } \Omega_{n+1}, \quad (2.21)
\]

in the weak sense. Then, using (2.21) together with (2.18), we deduce from the previous inequality that,

\[-\Delta_p \check{u}_n + \kappa_1 d(x)\delta_1 \check{u}_n \leq f_1(x, \check{u}_{n-1}, \check{v}_n) + \kappa_1 d(x)\delta_1 \check{u}_{n-1} \quad \text{in } \Omega_{n+1},
\]

in the weak sense. Hence, by estimate (2.17) and from the weak comparison principle applied in \( W^{1,p}(\Omega_{n+1}) \), we obtain

\[\check{u}_n \leq u_{n+1} \quad \text{a.e. in } \Omega_{n+1}.\]

Similarly, we get the existence and the behaviour of \( v_{n+1} \). Then, for almost every \( x \in \Omega \), we define

\[u(x) = \lim_{n \to \infty} \check{u}_n(x) \quad \text{and} \quad v(x) = \lim_{n \to \infty} \check{v}_n(x).
\]

Moreover, using a classical local regularity result of SERRIN[22], \( \check{u}_n, \check{v}_n \in C^{1,\gamma}_{\text{loc}}(\Omega_n) \) for some \( 0 < \gamma < 1 \) and \( \nabla \check{u}_n \to \nabla u \) and \( \nabla \check{v}_n \to \nabla v \), uniformly in any compact set \( K \) of \( \Omega \). Thus, \((u, v) \in [\nu, \overline{u}] \times [\nu, \overline{v}]\) and passing to the limit in \((P_n)\), \((u, v)\) is a solution of \((P)\) in the sense of distributions. \(\blacksquare\)
3 Applications

3.1 Example 1

In this section we focus on the following quasilinear elliptic and singular system,

\[
\begin{align*}
(P) \ \left\{ \begin{array}{ll}
-\Delta_p u &= K_1(x)u^{a_1}v^{b_1} \quad \text{in } \Omega; \quad u|_{\partial\Omega} = 0, \quad u > 0 \quad \text{in } \Omega, \\
-\Delta_q v &= K_2(x)v^{a_2}u^{b_2} \quad \text{in } \Omega; \quad v|_{\partial\Omega} = 0, \quad v > 0 \quad \text{in } \Omega.
\end{array} \right.
\]

In this problem,

(i) The exponents \(a_1 < p - 1, \quad a_2 < q - 1\) and \(b_1, b_2 \neq 0\) satisfy the subhomogeneous condition

\[
(p - 1 - a_1)(q - 1 - a_2) - |b_1b_2| > 0, \tag{3.1}
\]

which is equivalent to the existence of a positive constant \(\sigma > 0\) such that

\[
(p - 1 - a_1) - \sigma|b_1| > 0 \quad \text{and} \quad \sigma(q - 1 - a_2) - |b_2| > 0. \tag{3.2}
\]

(ii) \(K_1, K_2\) are two positive functions in \(\Omega\) satisfying

\[
K_1(x) = d(x)^{-k_1}L_1(d(x)) \quad \text{and} \quad K_2(x) = d(x)^{-k_2}L_2(d(x)) \quad \text{in } \Omega, \tag{3.3}
\]

with \(0 \leq k_1 < p, \quad 0 \leq k_2 < q\) and for \(i = 1, 2\), \(L_i\) a lower perturbation in \(C^2((0, D])\) (\(D\) the diameter of the domain \(\Omega\)), of the form:

\[
\forall t \in (0, D], \quad L_i(t) = \exp \left( \int_t^{2D} \frac{z_i(s)}{s} ds \right), \tag{3.4}
\]

with \(z_i \in C([0, D]) \cap C^1((0, D])\) and \(z_i(0) = 0\).

**Remark 3.1.**

a. Let us notice that (3.4) implies that

\[
\forall \varepsilon > 0, \quad \lim_{t \to 0^+} t^{-\varepsilon} L_i(t) = +\infty \quad \text{and} \quad \lim_{t \to 0^+} t^\varepsilon L_i(t) = 0. \tag{3.5}
\]

b. Definition (3.4) also implies that

\[
\lim_{t \to 0^+} \frac{tL_i'(t)}{L_i(t)} = 0 \quad \text{and} \quad \lim_{t \to 0^+} \frac{tL_i''(t)}{L_i(t)} = -1.
\]

c. If \(L_1, L_2\) are two functions satisfying (3.4), then for any \(\alpha, \beta \in \mathbb{R}\), the function \(L_1^\alpha \cdot L_2^\beta\) also satisfies (3.4).
d. Such functions $L_1$, $L_2$ defined as above belong to the Karamata Class [17].

**Example 3.2.** Let $m \in \mathbb{N}^*$ and $A >> D$ large enough. Let us define

$$
\forall t \in (0, D], \quad L_i(t) = \prod_{n=1}^{m} \left( \log \left( \frac{A}{t} \right) \right)^{\mu_n},
$$

where, $\log_n \overset{\text{def}}{=} \log \circ \cdots \circ \log (n \text{ times})$ and $\mu_n > 0$. Then $L_i$ satisfies (3.4).

In our study, $b_1 \neq 0$ and $b_2 \neq 0$. In the case where $b_1 > 0$ and $b_2 > 0$, the expression of the right-hand sides of the two coupled equations in system (P) define a **cooperative** interaction between the two components (species) $u$ and $v$:

$$
\frac{\partial}{\partial v} \left( K_1(x) u^{a_1} v^{b_1} \right) = b_1 K_1(x) u^{a_1} v^{b_1-1} > 0,
$$

(3.6)

$$
\frac{\partial}{\partial u} \left( K_2(x) v^{a_2} u^{b_2} \right) = b_2 K_2(x) v^{a_2} u^{b_2-1} > 0.
$$

(3.7)

In the case where $b_1 < 0$ and $b_2 < 0$, both partial derivative in (3.6) and (3.7) are negative and the expression of the right-hand sides of the two coupled equations of (P) defines a **competitive** interaction between $u$ and $v$.

First, we discuss the existence of positive weak solutions pairs to problem (P). For that, regarding Theorem 2.1, we take $f_1(x, u, v) = K_1(x) u^{a_1} v^{b_1}$, $f_2(x, u, v) = K_2(x) v^{a_2} u^{b_2}$ and construct suitable sub and supersolutions pairs of (P) in $W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)$.

Then, in the cases where (P) is either competitive or cooperative, we investigate the uniqueness of such positive weak solutions pairs. For that, it is essential that the mappings $T_1 \circ T_2$ and $T_2 \circ T_1$ (where $T_1$ and $T_2$ are defined in (1.1)) is **subhomogeneous**, which is equivalent to condition (3.1).

**Preliminary results**

Let $1 < r < \infty$, $\delta < r - 1$ and $K : x \mapsto d(x)^{-k} L(d(x))$, with $0 \leq k < r$ and $L$ a perturbation function satisfying (3.4). In view of constructing suitable pairs of sub and supersolutions to (P), we first introduce the following problem:

$$
-\Delta_r w = K(x) w^\delta \quad \text{in } \Omega; \quad w|_{\partial \Omega} = 0, \quad w > 0 \quad \text{in } \Omega.
$$

(3.8)
Theorem 3.3. Under the above hypothesis, we have:

(i) If $k - 1 < \delta < r - 1$, problem (3.8) has a unique positive weak solution $\psi \in W^{1,r}_0(\Omega)$ that satisfies the following estimate:

$$
\psi(x) \sim d(x) \quad \text{in } \Omega. \quad (3.9)
$$

In addition, we have $\psi \in C^{1,\alpha}(\overline{\Omega})$, for some $0 < \alpha < 1$.

(ii) If $\delta = k - 1$, problem (3.8) has a unique positive weak solution $\psi \in W^{1,r}_0(\Omega)$ that satisfies the following estimate:

$$
\psi(x) \sim d(x) \left( \int_{d(x)}^{2D} L(t)t^{-1} dt \right)^{\frac{1}{r-k}} \quad \text{in } \Omega. \quad (3.10)
$$

In addition, we have $\psi \in C^{0,\alpha}(\overline{\Omega})$, for some $0 < \alpha < 1$.

(iii) If $k - 2 + \frac{k-1}{r-1} < \delta < k - 1$, problem (3.8) has a unique positive weak solution $\psi \in W^{1,r}_0(\Omega)$ that satisfies the following estimate:

$$
\psi(x) \sim d(x) \left( \int_{d(x)}^{\frac{r-k}{r-1-\delta}} L(d(x)) \right)^{\frac{1}{r-1-\delta}} \quad \text{in } \Omega. \quad (3.11)
$$

In addition, we have $\psi \in C^{0,\alpha}(\overline{\Omega})$, for some $0 < \alpha < 1$.

(iv) If $\delta \leq k - 2 + \frac{k-1}{r-1}$, problem (3.8) has at least one positive weak solution $\psi \in W^{1,r}_{\text{loc}}(\Omega) \cap C_0(\overline{\Omega})$ that satisfies the following estimate:

$$
\psi(x) \sim d(x) \left( \int_{d(x)}^{\frac{r-k}{r-1-\delta}} L(d(x)) \right)^{\frac{1}{r-1-\delta}} \quad \text{in } \Omega. \quad (3.12)
$$

Proof. See Lemma 3.3 in GIACOMONI, MÀAGLI, SAUVY[9].

Remark 3.4. In (iv) above, it can be proved that $\forall \gamma > \frac{(r-1)(r-1-\delta)}{r(r-k)}, \psi^\gamma \in W^{1,r}_0(\Omega)$.

We give now a weak comparison principle used to establish the uniqueness of a positive weak solutions pair of (P).

Theorem 3.5. Let $K : \Omega \to \mathbb{R}^+\setminus \{0\}$ be a $L^1_{\text{loc}}(\Omega)$ function and $\delta < r - 1$. Assume $u, v \in W^{1,r}_0(\Omega) \cap L^\infty(\Omega)$ are two locally uniformly positive functions satisfying the sub and supersolution inequalities:

$$
-\Delta_r u \leq K(x)u^\delta \quad \text{and} \quad -\Delta_r v \geq K(x)v^\delta \quad \text{in } \Omega, \quad (3.13)
$$

in the sense of distributions (i.e. Radon measures) in $W^{-1,r'}(\Omega)$. Then
(i) If $\delta < 0$, inequality $u \leq v$ holds a.e. in $\Omega$.

(ii) If $\delta > 0$ and if we suppose in addition that there exist $C_1, C_2 > 0$ and a locally uniformly positive function $w_0 \in L^\infty(\Omega)$ such that $C_1w_0 \leq u, v \leq C_2w_0$ a.e. in $\Omega$ and

$$\int_{\Omega} K(x)w_0^{\delta+1} dx < +\infty, \quad (3.14)$$

inequality $u \leq v$ holds a.e. in $\Omega$.

To prove this theorem, we use the well-known inequality in Lemma 3.6 and the Díaz-Saa inequality (see DÍAZ-SAA[6]).

**Lemma 3.6.** There exists a constant $C_r > 0$ such that, for all $x, y \in \mathbb{R}^N$,

$$|x|^r - |y|^r - r|x|^{r-2}x(y-x) \geq \begin{cases} C_r|x-y|^r & \text{if } r \geq 2, \\ C_r\frac{|x-y|^2}{(|x|+|y|)^{2-r}} & \text{if } 1 < r < 2. \end{cases}$$

**Proof.** See Lemma 4.2 in LINDQVIST [20].

**Proof. (OF THEOREM 3.5)**

(i) If $\delta < 0$, we wish to prove that the function $w = (u - v)^+$ satisfies $w = 0$ a.e. in $\Omega$. First notice that $0 \leq w \in W^{1,r}_0(\Omega)$. Applying the duality between $W^{1,r}_0(\Omega)$ and $W^{-1,r'}(\Omega)$, respectively, to $w$ and the the difference

$$-\Delta_r u + \Delta_r v \leq K(x) \left(u^\delta - v^\delta\right)$$

which is $\leq 0$ on the set $\Omega_+ \overset{\text{def}}{=} \{x \in \Omega, \ w(x) > 0\}$, we obtain

$$\int_{\Omega_+} (|\nabla u|^{r-2}\nabla u - |\nabla v|^{r-2}\nabla v) \cdot (\nabla u - \nabla v) \, dx = \int_{\Omega} (|\nabla u|^{r-2}\nabla u - |\nabla v|^{r-2}\nabla v) \cdot \nabla w \, dx \leq 0.$$

This forces $\nabla w = 0$ a.e. in $\Omega_+$ and, consequently, also in $\Omega$. Since $w \in W^{1,r}_0(\Omega)$, we conclude that $w = 0$ a.e. in $\Omega$ as claimed, that is, $u \leq v$ a.e. in $\Omega$.

(ii) If $0 < \delta < r-1$, following some ideas in LINDQUIST[20] (see also DRÁBEK-HERNÁNDEZ[7]), we use the Díaz-Saa inequality.
More precisely, for $\varepsilon > 0$, we set $u_\varepsilon \overset{\text{def}}{=} u + \varepsilon$ and $v_\varepsilon \overset{\text{def}}{=} v + \varepsilon$ in $\Omega$ and we define

$$
\phi \overset{\text{def}}{=} \frac{u_\varepsilon^r - v_\varepsilon^r}{u_\varepsilon^{r-1}} \quad \text{and} \quad \psi \overset{\text{def}}{=} \frac{v_\varepsilon^r - u_\varepsilon^r}{v_\varepsilon^{r-1}} \quad \text{in} \ \Omega.
$$

Then, $\frac{u_\varepsilon}{v_\varepsilon}, \frac{v_\varepsilon}{u_\varepsilon} \in L^\infty(\Omega)$ and $\phi, \psi \in W_0^{1,r}(\Omega)$ with

$$
\nabla \phi = \left[ 1 + (r - 1) \left( \frac{v_\varepsilon}{u_\varepsilon} \right)^r \right] \nabla u - r \left( \frac{v_\varepsilon}{u_\varepsilon} \right)^{r-1} \nabla v \quad \text{in} \ \Omega, \quad (3.15)
$$

$$
\nabla \psi = \left[ 1 + (r - 1) \left( \frac{u_\varepsilon}{v_\varepsilon} \right)^r \right] \nabla v - r \left( \frac{u_\varepsilon}{v_\varepsilon} \right)^{r-1} \nabla u \quad \text{in} \ \Omega. \quad (3.16)
$$

Setting $\Omega_+ \overset{\text{def}}{=} \{ x \in \Omega, \ u(x) > v(x) \}$, we have that $\phi > 0$ and $\psi < 0$ in $\Omega_+$ and

$$
\int_{\Omega_+} |\nabla u|^{r-2} \nabla u \cdot \nabla \phi \, dx \leq \int_{\Omega_+} K(x) u^\delta \phi \, dx < +\infty,
$$

$$
\int_{\Omega_+} |\nabla v|^{r-2} \nabla v \cdot \nabla \psi \, dx \leq \int_{\Omega_+} K(x) v^\delta \psi \, dx < +\infty.
$$

Using equalities (3.15) and (3.16) and the fact that

$$
|\nabla \ln u_\varepsilon| = \frac{|\nabla u|}{u_\varepsilon} \quad \text{and} \quad |\nabla \ln v_\varepsilon| = \frac{|\nabla v|}{v_\varepsilon} \quad \text{in} \ \Omega, \quad (3.17)
$$

we get

$$
\int_{\Omega_+} |\nabla u|^{r-2} \nabla u \cdot \nabla \phi \, dx + \int_{\Omega_+} |\nabla v|^{r-2} \nabla v \cdot \nabla \psi \, dx
\quad = \int_{\Omega_+} (u_\varepsilon^r - v_\varepsilon^r) (|\nabla \ln u_\varepsilon|^{r} - |\nabla \ln v_\varepsilon|^{r}) \, dx
\quad - \int_{\Omega_+} r v_\varepsilon^r |\nabla \ln u_\varepsilon|^{r-2} (\nabla \ln u_\varepsilon) \cdot (\nabla \ln v_\varepsilon - \nabla \ln u_\varepsilon) \, dx
\quad - \int_{\Omega_+} r u_\varepsilon^r |\nabla \ln v_\varepsilon|^{r-2} (\nabla \ln v_\varepsilon) \cdot (\nabla \ln u_\varepsilon - \nabla \ln v_\varepsilon) \, dx.
$$
a. If $r \geq 2$, from Lemma 3.6, it follows that
\[
\int_{\Omega^+} |\nabla u|^{-2} \nabla u. \nabla \phi \, dx + \int_{\Omega^+} |\nabla v|^{-2} \nabla v. \nabla \psi \, dx \\
\geq \int_{\Omega^+} (u_{\varepsilon}^r - v_{\varepsilon}^r) (|\nabla \ln u_{\varepsilon}|^r - |\nabla \ln v_{\varepsilon}|^r) \, dx \\
+ \int_{\Omega^+} v_{\varepsilon}^r \left( |\nabla \ln u_{\varepsilon}|^r - |\nabla \ln v_{\varepsilon}|^r + C_r |\nabla \ln u_{\varepsilon} - \nabla \ln v_{\varepsilon}|^r \right) dx \\
+ \int_{\Omega^+} u_{\varepsilon}^r \left( |\nabla \ln v_{\varepsilon}|^r - |\nabla \ln u_{\varepsilon}|^r + C_r |\nabla \ln u_{\varepsilon} - \nabla \ln v_{\varepsilon}|^r \right) dx \\
= C_r \int_{\Omega^+} |u_{\varepsilon}^r \nabla v_{\varepsilon} - v_{\varepsilon}^r \nabla u_{\varepsilon}|^r \left( \frac{1}{u_{\varepsilon}^r} + \frac{1}{v_{\varepsilon}^r} \right) dx.
\]

b. If $1 < r < 2$, Lemma 3.6 entails
\[
\int_{\Omega^+} |\nabla u|^{-2} \nabla u. \nabla \phi \, dx + \int_{\Omega^+} |\nabla v|^{-2} \nabla v. \nabla \psi \, dx \\
\geq C_r \int_{\Omega^+} \frac{|u_{\varepsilon} \nabla v_{\varepsilon} - v_{\varepsilon} \nabla u_{\varepsilon}|^2}{(u_{\varepsilon} |\nabla v_{\varepsilon}| + v_{\varepsilon} |\nabla u_{\varepsilon}|)^{2-r}} \left( \frac{1}{u_{\varepsilon}^r} + \frac{1}{v_{\varepsilon}^r} \right) dx.
\]

In the right-hand side, we get
\[
\int_{\Omega^+} K(x) \left( u^\delta \phi + v^\delta \psi \right) \, dx = \\
\int_{\Omega^+} K(x) \left[ \frac{u^\delta}{u_{\varepsilon}^{r-1}} \left( \frac{u}{u_{\varepsilon}} \right)^{r-1} - \frac{v^\delta}{v_{\varepsilon}^{r-1}} \left( \frac{v}{v_{\varepsilon}} \right)^{r-1} \right] \left( u_{\varepsilon}^r - v_{\varepsilon}^r \right) \, dx.
\]

Then, since $\frac{u}{u_{\varepsilon}} \to 1$, $\frac{v}{v_{\varepsilon}} \to 1$ as $\varepsilon \to 0^+$ a.e. in $\Omega$, we get from (3.14) and Lebesgue’s Theorem that
\[
\lim_{\varepsilon \to 0^+} \int_{\Omega^+} K(x) \left( u^\delta \phi + v^\delta \psi \right) \, dx \leq 0.
\]

By Fatou’s Lemma and using the above estimates, we obtain in the both cases that $|u \nabla v - v \nabla u| = 0$ a.e. in $\Omega_+$, from which we get that on each connected component set $\omega$ of $\Omega_+$, there exists $k > 0$ such that $u = kv$ a.e. in $\omega$. From sub an supersolution inequalities (3.13) we have,
\[
k^r \int_{\omega} K(x) v^{\delta+1} \, dx \leq k^r \int_{\omega} |\nabla v|^r \, dx = \int_{\omega} |\nabla u|^r \, dx \\
\leq \int_{\omega} K(x) u^{\delta+1} \, dx = k^{\delta+1} \int_{\omega} K(x) v^{\delta+1} \, dx. \quad (3.18)
\]
Hence, \( k \leq 1 \) which implies that \( u \leq v \) a.e. in \( \Omega_+ \) and from the definition of \( \Omega_+ \), \( u \leq v \) a.e. in \( \Omega \).

**Main results**

**Theorem 3.7.** Assume that the exponents \( a_1 < p - 1 \), \( a_2 < q - 1 \) and \( b_1, b_2 \neq 0 \) in problem (P) satisfy the hypothesis (3.1).

(i) Set

\[
\begin{align*}
\alpha_1 &= \frac{q - 1 - a_2}{(p - 1 - a_1)(q - 1 - a_2) - b_1b_2}, & \alpha_2 &= \frac{p - 1 - a_1}{(p - 1 - a_1)(q - 1 - a_2) - b_1b_2}, \\
\beta_1 &= \frac{b_1}{(p - 1 - a_1)(q - 1 - a_2) - b_1b_2}, & \beta_2 &= \frac{b_2}{(p - 1 - a_1)(q - 1 - a_2) - b_1b_2}, \\
\gamma_1 &= \frac{(p - k_1)(q - 1 - a_2) + (q - k_2)b_1}{(p - 1 - a_1)(q - 1 - a_2) - b_1b_2}, & \gamma_2 &= \frac{(q - k_2)(p - 1 - a_1) + (p - k_1)b_2}{(p - 1 - a_1)(q - 1 - a_2) - b_1b_2}
\end{align*}
\]

and assume that

\[
1 - \frac{1}{p} < \gamma_1 < 1 \quad \text{and} \quad 1 - \frac{1}{q} < \gamma_2 < 1. \tag{3.19}
\]

Then, problem (P) possesses positive solutions \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) that satisfy the following estimates:

\[
\begin{align*}
u(x) &\sim d(x)^{\gamma_1} L_1(d(x))^{\alpha_1} L_2(d(x))^{\beta_1} \quad \text{in} \ \Omega, \tag{3.20} \\
v(x) &\sim d(x)^{\gamma_2} L_2(d(x))^{\alpha_2} L_1(d(x))^{\beta_2} \quad \text{in} \ \Omega. \tag{3.21}
\end{align*}
\]

In addition, we have \((u, v) \in C^{0,\alpha}(\overline{\Omega}) \times C^{0,\alpha}(\overline{\Omega}), \text{for some } 0 < \alpha < 1.\)

(ii) Now assume that

\[
k_1 - 1 < a_1 + b_1 < p - 1 \quad \text{and} \quad k_2 - 1 < a_2 + b_2 < q - 1. \tag{3.22}
\]

Then, problem (P) possesses positive solutions \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) that satisfy the following estimates:

\[
u(x) \sim d(x) \quad \text{and} \quad v(x) \sim d(x) \quad \text{in} \ \Omega. \tag{3.23}
\]

In addition, we have \((u, v) \in C^{1,\alpha}(\overline{\Omega}) \times C^{1,\alpha}(\overline{\Omega}), \text{for some } 0 < \alpha < 1.\)
(iii) Set
\[ \gamma = \frac{p - k_1 + b_1}{p - 1 - a_1} \]
and assume that
\[ 1 - \frac{1}{p} < \gamma < 1 \quad \text{and} \quad k_2 - 1 < a_2 + b_2 \gamma < q - 1. \] (3.24)

Then, problem \((P)\) possesses positive solutions \((u, v) \in W_0^{1,p}(\Omega) \times W_0^{1,q}(\Omega)\) that satisfy the following estimates:
\[ u(x) \sim d(x)^\gamma L_1(d(x))^\frac{1}{p-1-a_1} \quad \text{and} \quad v(x) \sim d(x) \quad \text{in } \Omega. \] (3.25)

In addition, we have \((u, v) \in \mathcal{C}^{0,\alpha}(\overline{\Omega}) \times \mathcal{C}^{1,\alpha}(\overline{\Omega}),\) for some \(0 < \alpha < 1.\)

(iv) Symmetrically to part (iii) above, set
\[ \gamma = \frac{q - k_2 + b_2}{q - 1 - a_2} \]
and assume that
\[ k_1 - 1 < a_1 + b_1 \gamma < p - 1 \quad \text{and} \quad 1 - \frac{1}{q} < \gamma < 1. \] (3.26)

Then, problem \((P)\) possesses positive solutions \((u, v) \in W_0^{1,p}(\Omega) \times W_0^{1,q}(\Omega)\) that satisfy the following estimates:
\[ u(x) \sim d(x) \quad \text{and} \quad v(x) \sim d(x)^\gamma L_2(d(x))^\frac{1}{q-1-a_2} \quad \text{in } \Omega. \] (3.27)

In addition, we have \((u, v) \in \mathcal{C}^{1,\alpha}(\overline{\Omega}) \times \mathcal{C}^{0,\alpha}(\overline{\Omega}),\) for some \(0 < \alpha < 1.\)

**Theorem 3.8.** Let \(a_1 < p - 1, \ a_2 < q - 1\) and \(b_1, b_2 \neq 0\) satisfying the subhomogeneity hypothesis (3.1). Assume that \((P)\) is either a competitive or a cooperative system, i.e. \(b_1b_2 > 0.\) Then, each solution provided by Theorem 3.7 is unique.

The cooperative case is further analysed in the following result:

**Theorem 3.9.** Let us suppose that the exponents \(a_1 < p - 1, \ a_2 < q - 1\) and \(b_1, b_2 \neq 0\) satisfy the subhomogeneity hypothesis (3.1). Moreover, assume that \((P)\) is a cooperative system, i.e., \(b_1 > 0\) and \(b_2 > 0.\)
Quasilinear and singular elliptic systems

(i) Set

\[
\gamma_1 = \frac{(p - k_1)(q - 1 - a_2) + (q - k_2)b_1}{(p - 1 - a_1)(q - 1 - a_2) - b_1b_2},
\]

\[
\gamma_2 = \frac{(q - k_2)(p - 1 - a_1) + (p - k_1)b_2}{(p - 1 - a_1)(q - 1 - a_2) - b_1b_2},
\]

and assume that one of the three following conditions are satisfied:

\[
0 < \gamma_1 \leq 1 - \frac{1}{p} \quad \text{and} \quad 0 < \gamma_2 \leq 1 - \frac{1}{q},
\]

\[
1 - \frac{1}{p} < \gamma_1 < 1 \quad \text{and} \quad 0 < \gamma_2 \leq 1 - \frac{1}{q},
\]

\[
0 < \gamma_1 \leq 1 - \frac{1}{p} \quad \text{and} \quad 1 - \frac{1}{q} < \gamma_2 < 1.
\]

Then, problem \((P)\) admits positive solutions \((u, v) \in W^{1,p}_{\text{loc}}(\Omega) \times W^{1,q}_{\text{loc}}(\Omega)\) in the sense of distributions satisfying the estimates (3.20) and (3.21).

(ii) Set

\[
\gamma = \frac{p - k_1 + b_1}{p - 1 - a_1}
\]

and assume that

\[
0 < \gamma \leq 1 - \frac{1}{p} \quad \text{and} \quad k_2 - 1 < a_2 + b_2\gamma < q - 1.
\]

Then, problem \((P)\) nevertheless admits positive solutions \((u, v) \in W^{1,p}_{\text{loc}}(\Omega) \times W^{1,q}_{0}(\Omega)\) in the sense of distributions satisfying the estimates (3.20) and (3.21).

(iii) Symmetrically to part (ii) above, set

\[
\gamma = \frac{q - k_2 + b_2}{q - 1 - a_2}
\]

and assume that

\[
k_1 - 1 < a_1 + b_1\gamma < p - 1 \quad \text{and} \quad 0 < \gamma \leq 1 - \frac{1}{q}.
\]

Then, problem \((P)\) possesses positive solutions \((u, v) \in W^{1,p}_{0}(\Omega) \times W^{1,q}_{\text{loc}}(\Omega)\) in the sense of distributions that satisfies the estimates given in (3.27).

The next result deals with some limiting cases:
Theorem 3.10. Assume that the exponents $a_1 < p - 1, a_2 < q - 1$ and $b_1, b_2 
eq 0$ satisfy the subhomogeneity hypothesis (3.1).

(i) Assume that

$$a_1 + b_1 = k_1 - 1 \quad \text{and} \quad k_2 - 1 \leq a_2 + b_2 < q - 1.$$  \hspace{1cm} (3.37)

Then, for all $\varepsilon > 0$ small enough, there exist $C_1, C_2 > 0$ and $C'_1, C'_2 > 0$ such that problem $(P)$ possesses positive solutions $(u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)$ that satisfy the following estimates:

$$C_1 d(x) \leq u \leq C_2 d(x)^{1-\varepsilon} \quad \text{and} \quad C'_1 d(x) \leq v \leq C'_2 d(x)^{1-\varepsilon\sigma} \quad \text{in} \quad \Omega,$$  \hspace{1cm} (3.38)

where $\sigma > 0$ is given in (3.2). In addition, we have $(u, v) \in \mathcal{C}^{0,\alpha}(\overline{\Omega}) \times \mathcal{C}^{0,\alpha}(\overline{\Omega})$, for some $0 < \alpha < 1$.

(ii) Symmetrically, assume that

$$a_2 + b_2 = k_2 - 1 \quad \text{and} \quad k_1 - 1 \leq a_1 + b_1 < q - 1.$$  \hspace{1cm} (3.39)

Then, for all $\varepsilon > 0$ small enough, there exist $C_1, C_2 > 0$ and $C'_1, C'_2 > 0$ such that problem $(P)$ possesses positive solutions $(u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)$ that satisfy the following estimates:

$$C_1 d(x) \leq u \leq C_2 d(x)^{1-\varepsilon} \quad \text{and} \quad C'_1 d(x) \leq v \leq C'_2 d(x)^{1-\varepsilon\sigma} \quad \text{in} \quad \Omega.$$  \hspace{1cm} (3.40)

In addition, we have $(u, v) \in \mathcal{C}^{0,\alpha}(\overline{\Omega}) \times \mathcal{C}^{0,\alpha}(\overline{\Omega})$, for some $0 < \alpha < 1$.

(iii) Let us abbreviate

$$\gamma = \frac{p - k_1 + b_1}{p - 1 - a_1}$$

and assume that

$$1 - \frac{1}{p} < \gamma < 1 \quad \text{and} \quad a_2 + b_2 \gamma = k_2 - 1.$$  \hspace{1cm} (3.41)

Then, for all $\varepsilon > 0$ small enough, there exist $C_1, C_2 > 0$ and $C'_1, C'_2 > 0$ such that problem $(P)$ possesses positive solutions $(u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)$ that satisfy the following estimates in $\Omega$:

$$C_1 d(x)^\gamma \leq u \leq C_2 d(x)^{1-\varepsilon} \quad \text{and} \quad C'_1 d(x) \leq v \leq C'_2 d(x)^{1-\varepsilon\sigma}.$$  \hspace{1cm} (3.42)

In addition, we have $(u, v) \in \mathcal{C}^{0,\alpha}(\overline{\Omega}) \times \mathcal{C}^{0,\alpha}(\overline{\Omega})$, for some $0 < \alpha < 1$. 

(iv) Symmetrically, let us abbreviate

\[ \gamma = \frac{q - k_2 + b_2}{q - 1 - a_2} \]

and assume that

\[ a_1 + b_1 \gamma = k_2 - 1 \quad \text{and} \quad 1 - \frac{1}{q} < \gamma < 1. \]  

Then, for all \( \varepsilon > 0 \) small enough, there exist \( C_1, C_2 > 0 \) and \( C'_1, C'_2 > 0 \) such that problem \( (P) \) possesses positive solutions \( (u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega) \) that satisfy the following estimates in \( \Omega \):

\[ C_1 d(x) \leq u \leq C_2 d(x)^{1-\varepsilon} \quad \text{and} \quad C'_1 d(x)^{\gamma+\varepsilon\sigma} \leq v \leq C'_2 d(x)^{\gamma-\varepsilon\sigma}. \]  

In addition, we have \( (u, v) \in \mathcal{C}^{0,\alpha}(\overline{\Omega}) \times \mathcal{C}^{0,\alpha}(\overline{\Omega}) \), for some \( 0 < \alpha < 1 \).

**Proof of Theorem 3.7**

Thanks to Theorem 3.3, we apply Theorem 2.1 with a suitable choice of sub and supersolutions pairs \( (u, v), (\bar{u}, \bar{v}) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega) \) in the following form:

\[ u \equiv m \psi_1 \quad \text{and} \quad \bar{u} \equiv m^{-1} \psi_1 \quad \text{in} \ \Omega, \]

\[ v \equiv m^\sigma \psi_2 \quad \text{and} \quad \bar{v} \equiv m^{-\sigma} \psi_2 \quad \text{in} \ \Omega, \]

where \( \sigma > 0 \) is given in (3.2), \( 0 < m < 1 \) is an appropriate constant small enough and \( \psi_1 \in W^{1,p}_0(\Omega), \psi_2 \in W^{1,q}_0(\Omega) \) are given by Theorem 3.3 as the respective unique solutions of problems

\[ -\Delta_p w = d(x)^{-k_1} L_1(d(x)) w^{\delta_1} \quad \text{in} \ \Omega; \quad w|_{\partial \Omega} = 0, \ w > 0 \quad \text{in} \ \Omega, \]  

\[ -\Delta_q w = d(x)^{-k_2} L_2(d(x)) w^{\delta_2} \quad \text{in} \ \Omega; \quad w|_{\partial \Omega} = 0, \ w > 0 \quad \text{in} \ \Omega, \]

satisfying some cone conditions we specify below. In the following alternatives, we choose suitable perturbations \( L_1, L_2 \) as in (3.4) and suitable values of exponents \( k_1 - 2 + \frac{k_1 - 1}{p - 1} < \delta_1 < p - 1 \) and \( k_2 - 2 + \frac{k_2 - 1}{q - 1} < \delta_2 < q - 1 \) in order to satisfy

\[ -\Delta_p \psi_1 \sim K_1(x) \psi_1^{a_1} \psi_2^{b_1} \quad \text{and} \quad -\Delta_q \psi_2 \sim K_2(x) \psi_2^{a_2} \psi_1^{b_2} \quad \text{in} \ \Omega, \]

which provide us the inequalities (1.7) to (1.10) in order to apply Theorem 2.1.
**Alternative 1:** We look for positive solutions \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) to (P) by making the “Ansatz” that

\[
u(x) \sim d(x)^{\gamma_1} L_1(d(x))^{\alpha_1} L_2(d(x))^{\beta_1} \quad \text{in } \Omega,
\]

\[
v(x) \sim d(x)^{\gamma_2} L_2(d(x))^{\alpha_2} L_1(d(x))^{\beta_2} \quad \text{in } \Omega,
\]

for some \(\gamma_1 \in (1 - \frac{1}{p}, 1), \gamma_2 \in (1 - \frac{1}{q}, 1)\) and \(\alpha_1, \alpha_2, \beta_1, \beta_2 \in \mathbb{R}\). For that, we take in (3.45) and (3.46)

\[
k_1 - 2 + \frac{k_1 - 1}{p - 1} < \delta_1 < k_1 - 1 \quad \text{and} \quad k_2 - 2 + \frac{k_2 - 1}{q - 1} < \delta_2 < k_2 - 1, \quad (3.48)
\]

\[
\mathcal{L}_1 = L_1^{\lambda_1} L_2^{\mu_1} \quad \text{and} \quad \mathcal{L}_2 = L_2^{\lambda_2} L_1^{\mu_2} \quad \text{in } \Omega,
\]

where \(\lambda_1, \lambda_2, \mu_1, \mu_2 \in \mathbb{R}\) are suitable exponents we fix later. By Theorem 3.3, \(\psi_1 \in W^{1,p}_0(\Omega), \psi_2 \in W^{1,q}_0(\Omega)\) and satisfy

\[
\psi_1(x) \sim d(x)^{\frac{p - k_1}{p - 1 - \delta_1}} L_1(d(x))^{\frac{\lambda_1}{p - 1 - \delta_1}} L_2(d(x))^{\frac{\mu_1}{p - 1 - \delta_1}} \quad \text{in } \Omega, \quad (3.49)
\]

\[
\psi_2(x) \sim d(x)^{\frac{q - k_2}{q - 1 - \delta_2}} L_2(d(x))^{\frac{\lambda_2}{q - 1 - \delta_2}} L_1(d(x))^{\frac{\mu_2}{q - 1 - \delta_2}} \quad \text{in } \Omega. \quad (3.50)
\]

In view of satisfying estimates given in (3.47), the comparison of the term \(-\Delta_p \psi_1\) with \(K_1(x) \psi_1^{a_1} \psi_2^{b_1}\) on one side, and the term \(-\Delta_q \psi_2\) with \(K_2(x) \psi_2^{a_2} \psi_1^{b_2}\) on the other side, imposes the exponents \(\lambda_1, \lambda_2, \mu_1, \mu_2\) and \(\delta_1, \delta_2\) to satisfy the following system:

\[
\begin{align*}
\delta_1 \frac{p - k_1}{p - 1 - \delta_1} & = a_1 \frac{p - k_1}{p - 1 - \delta_1} + b_1 \frac{q - k_2}{q - 1 - \delta_2}, \\
\delta_2 \frac{q - k_2}{q - 1 - \delta_2} & = a_2 \frac{q - k_2}{q - 1 - \delta_2} + b_2 \frac{p - k_1}{p - 1 - \delta_1}, \\
\lambda_1 \frac{p - 1}{p - 1 - \delta_1} & = 1 + a_1 \frac{\lambda_1}{p - 1 - \delta_1} + b_1 \frac{\mu_2}{q - 1 - \delta_2}, \\
\lambda_2 \frac{q - 1}{q - 1 - \delta_2} & = 1 + b_2 \frac{\mu_1}{q - 1 - \delta_2} + a_2 \frac{\lambda_2}{q - 1 - \delta_2}, \\
\mu_1 \frac{p - 1}{p - 1 - \delta_1} & = a_1 \frac{\mu_1}{p - 1 - \delta_1} + b_1 \frac{\lambda_1}{q - 1 - \delta_2}, \\
\mu_2 \frac{q - 1}{q - 1 - \delta_2} & = b_2 \frac{\lambda_1}{p - 1 - \delta_1} + a_2 \frac{\mu_2}{q - 1 - \delta_2}.
\end{align*}
\]

Then, we get

\[
\gamma_1 = \frac{p - k_1}{p - 1 - \delta_1} = \frac{(p - k_1)(q - 1 - a_2) + (q - k_2)b_1}{(p - 1 - a_1)(q - 1 - a_2) - b_1 b_2}, \quad (3.51)
\]

\[
\gamma_2 = \frac{q - k_2}{q - 1 - \delta_2} = \frac{(q - k_2)(p - 1 - a_1) + (p - k_1)b_2}{(p - 1 - a_1)(q - 1 - a_2) - b_1 b_2}, \quad (3.52)
\]
\[
\alpha_1 = \frac{\lambda_1}{p - 1 - \delta_1} = \frac{q - 1 - a_2}{(p - 1 - a_1)(q - 1 - a_2) - b_1 b_2}, 
\]

(3.53)

\[
\alpha_2 = \frac{\lambda_2}{q - 1 - \delta_2} = \frac{p - 1 - a_1}{(p - 1 - a_1)(q - 1 - a_2) - b_1 b_2}, 
\]

(3.54)

\[
\beta_1 = \frac{\mu_1}{p - 1 - \delta_1} = \frac{b_1}{(p - 1 - a_1)(q - 1 - a_2) - b_1 b_2}, 
\]

(3.55)

\[
\beta_2 = \frac{\mu_2}{q - 1 - \delta_2} = \frac{b_1}{(p - 1 - a_1)(q - 1 - a_2) - b_1 b_2}, 
\]

(3.56)

which imply estimate (3.47). Moreover, inequalities (3.19) are then equivalent to inequalities (3.48). Let \((u, v) \in \overline{[\underline{u}, \overline{u}]} \times \overline{[\underline{v}, \overline{v}]}\). On one hand, we have

\[-\Delta_p \underline{u} \leq m^{p-1} C_1 L_1(d(x))^{\lambda_1 + \delta_1 \gamma_1} L_2(d(x))^{\mu_1 + \delta_1 \beta_1} d(x)^{\delta_1 \gamma_1 - k_1} \text{ in } \Omega,\]

\[-\Delta_q \overline{u} \leq m^{\sigma(q-1)} C_1' L_2(d(x))^{\lambda_2 + \delta_2 \alpha_2} L_1(d(x))^{\mu_2 + \delta_2 \beta_2} d(x)^{\delta_2 \gamma_2 - k_2} \text{ in } \Omega.\]

On the other hand,

\[K_1(x)\underline{u}^{a_1} v^{b_1} \geq C_2 m^{a_1 + \sigma |b_1|} \Lambda_1(d(x)) d(x)^{a_1 \gamma_1 + b_1 \gamma_2 - k_1} \text{ in } \Omega\]

with \(\Lambda_1 = L_1^{1+a_1 \alpha_1 + b_1 \beta_2} L_2^{a_1 \beta_1 + b_1 \alpha_2}\). Similarly,

\[K_2(x)\overline{u}^{a_2} u^{b_2} \geq C_2' m^{\sigma a_2 + |b_2|} \Lambda_2(d(x)) d(x)^{a_2 \gamma_2 + b_2 \gamma_1 - k_2} \text{ in } \Omega,\]

with \(\Lambda_2 = L_2^{1+a_2 \alpha_2 + b_2 \beta_1} L_1^{a_2 \beta_2 + b_2 \alpha_1}\). Then, under condition (3.2) and thanks to (3.51) to (3.56), \((\underline{u}, \overline{v})\) is a subsolutions pair of problem \((P)\), for \(m\) small enough. Next,

\[-\Delta_p \overline{u} \geq m^{1-p} C_3 L_1(d(x))^{\lambda_1 + \delta_1 \gamma_1} L_2(d(x))^{\mu_1 + \delta_1 \beta_1} d(x)^{\delta_1 \gamma_1 - k_1} \text{ in } \Omega,\]

\[-\Delta_q \underline{v} \geq m^{\sigma(1-q)} C_3' L_2(d(x))^{\lambda_2 + \delta_2 \alpha_2} L_1(d(x))^{\mu_2 + \delta_2 \beta_2} d(x)^{\delta_2 \gamma_2 - k_2} \text{ in } \Omega.\]

Furthermore,

\[K_1(x)\overline{u}^{a_1} v^{b_1} \leq C_4 m^{-a_1 - \sigma |b_1|} \Lambda_1(d(x)) d(x)^{a_1 \gamma_1 + b_1 \gamma_2 - k_1} \text{ in } \Omega.\]

Similarly,

\[K_2(x)\overline{u}^{a_2} u^{b_2} \leq C_4 m^{-\sigma a_2 - |b_2|} \Lambda_2(d(x)) d(x)^{a_2 \gamma_2 + b_2 \gamma_1 - k_2} \text{ in } \Omega.\]

Then under (3.2) and thanks to (3.51) to (3.56), \((\overline{u}, \overline{v})\) is a supersolutions pair of problem \((P)\), for \(m\) small enough. Therefore estimates (1.7) to (1.10) hold. Let
In view of satisfying estimates given in (3.47), we fix $\delta$ since $\gamma$ the conical shell. Finally, using Theorem A.1, we get that any positive weak solutions pair to (P) in $W^{1,p}(\Omega) \times W^{1,q}(\Omega)$ satisfying the estimates (3.20) and (3.21).

Finally, using Theorem A.1, we get that any positive weak solutions pair to (P) in the conical shell $C$ belongs to $C^{0,\alpha}(\Omega) \times C^{0,\alpha}(\Omega)$, for some $0 < \alpha < 1$. This proves (i) of Theorem 3.7.

**Alternative 2:** In this part, we look for positive solutions $(u, v) \in W^{1,p}(\Omega) \times W^{1,q}(\Omega)$ by making the "Ansatz" that both function $u$ and $v$ behave like the distance function $d(x)$ for $x \in \Omega$ near the boundary $\partial \Omega$. For that, similarly as in Alternative 1, we take in (3.45) and (3.46)

$$k_1 - 1 < \delta_1 < p - 1 \quad \text{and} \quad k_2 - 1 < \delta_2 < q - 1, \quad (3.57)$$

$$L_1 = L_1 \quad \text{and} \quad L_2 = L_2 \quad \text{in} \ \Omega.$$  

By Theorem 3.3, $\psi_1 \in W^{1,p}(\Omega), \psi_2 \in W^{1,q}(\Omega)$ and satisfy

$$\psi_1(x) \sim d(x) \quad \text{and} \quad \psi_2(x) \sim d(x) \quad \text{in} \ \Omega.$$  

In view of satisfying estimates given in (3.47), we fix $\delta_1$ and $\delta_2$ as follows:

$$\delta_1 = a_1 + b_1 \quad \text{and} \quad \delta_2 = a_2 + b_2. \quad (3.58)$$
Then, (3.47) holds and inequalities given in (3.57) entail (3.22). The rest of the proof is as in Alternative 1. This proves (ii) of Theorem 3.7.

**Alternative 3:** Now we combine our methods from Alternative 1 and Alternative 2. We search for positive solutions \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) to problem \((P)\) by again making the "Ansatz" that
\[
u(x) \sim \eta_k(d(x))^{\alpha} L_2(d(x))^{\beta} \text{ in } \Omega,
\]
for some \(\gamma \in (1 - \frac{1}{p}, 1)\) and \(\alpha, \beta \in \mathbb{R}^\ast\) and \(\nu\) behave like the distance function in \(\Omega\). For that, we take in (3.45) and (3.46)
\[
k_1 - 2 + \frac{k_1 - 1}{p - 1} < \delta_1 < k_1 - 1 \quad \text{and} \quad k_2 - 1 < \delta_2 < q - 1, \quad (3.59)
\]
\[
\mathcal{L}_1 = L_1^{\lambda_1}.L_2^{\mu_1} \quad \text{and} \quad \mathcal{L}_2 = L_2^{\lambda_2}.L_1^{\mu_2} \text{ in } \Omega,
\]
where \(\lambda_1, \lambda_2, \mu_1, \mu_2 \in \mathbb{R}\) are suitable exponents to be fixed. By Theorem 3.3, \(\psi_1 \in W^{1,p}_0(\Omega), \psi_2 \in W^{1,q}_0(\Omega)\) and satisfy
\[
\psi_1(x) \sim d(x)^{\frac{p - k_1}{p - 1 - \delta_1}} L_1(d(x))^\frac{\lambda_1}{p - 1 - \delta_1} L_2(d(x))^\frac{\mu_1}{p - 1 - \delta_1} \quad \text{and} \quad \psi_2(x) \sim d(x) \text{ in } \Omega.
\]
In view of (3.47), the exponents have to satisfy
\[
\begin{cases}
\delta_1 \frac{p - k_1}{p - 1 - \delta_1} = a_1 \frac{p - k_1}{p - 1 - \delta_1} + b_1, & \delta_2 = b_2 \frac{p - k_1}{p - 1 - \delta_1} + a_2, \\
\lambda_1 \frac{p - 1}{p - 1 - \delta_1} = a_1 \frac{\lambda_1}{p - 1 - \delta_1} + 1, & \lambda_2 = b_2 \frac{\mu_1}{p - 1 - \delta_1} + 1, \\
\mu_1 \frac{p - 1}{p - 1 - \delta_1} = a_1 \frac{\mu_1}{p - 1 - \delta_1}, & \mu_2 = b_2 \frac{\lambda_1}{p - 1 - \delta_1}.
\end{cases}
\]
Hence we obtain
\[
\gamma = \frac{p - k_1}{p - 1 - \delta_1} = \frac{p - k_1 + b_1}{p - 1 - a_1} \quad \text{and} \quad \delta_2 = a_2 + b_2 \frac{p - k_1 + b_1}{p - 1 - a_1},
\]
\[
\alpha = \frac{\lambda_1}{p - 1 - \delta_1} = \frac{1}{p - 1 - \delta_1} \quad \text{and} \quad \beta = \frac{\mu_1}{p - 1 - \delta_1} = 0.
\]
The rest of the proof is as in Alternative 1. This proves (iii) of Theorem 3.7 and (iv) is the corresponding symmetric case of (iii). \(\square\)

**Proof of Theorem 3.8**

To prove uniqueness of solutions, we apply a classical argument of Kransnosel'skiĭ [18]. Let \((u, v), (\bar{u}, \bar{v}) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\), be two distinct positive weak solutions pairs to problem \((P)\) in the conical shell \(\mathcal{C} = [u, \overline{u}] \times [v, \overline{v}]\), where \((u, v), \ldots\).
$(\overline{u}, \overline{v})$ are given in the proof of Theorem 3.7. This means that $T(u, v) = (u, v)$ and $T(\overline{u}, \overline{v}) = (\overline{u}, \overline{v})$, which implies that, $T_1 \circ T_2(u) = u$, $T_2 \circ T_1(v) = v$ and $T_1 \circ T_2(\overline{u}) = \overline{u}$, $T_1 \circ T_2(\overline{v}) = \overline{v}$, respectively. Let us define
\[
C_{\text{max}} \overset{\text{def}}{=} \sup\{ C \in \mathbb{R}^+, \; C\overline{u} \leq u \; \text{ and } \; C\overline{v} \leq v \; \text{ a.e. in } \Omega \}. \quad (3.60)
\]
\[
T_1 \circ T_2(C_{\text{max}} \overline{u}) = (C_{\text{max}})^{\frac{b_1}{p-1-a_1} \cdot \frac{b_2}{q-1-a_2}} T_1 \circ T_2(\overline{u}) = (C_{\text{max}})^{\frac{b_1}{p-1-a_1} \cdot \frac{b_2}{q-1-a_2} \overline{u}},
\]
\[
T_2 \circ T_1(C_{\text{max}} \overline{v}) = (C_{\text{max}})^{\frac{b_2}{q-1-a_2} \cdot \frac{b_1}{p-1-a_1}} T_2 \circ T_1(\overline{v}) = (C_{\text{max}})^{\frac{b_2}{q-1-a_2} \cdot \frac{b_1}{p-1-a_1} \overline{v}}.
\]
Therefore, by Theorem 3.5, both mappings $T_1 \circ T_2$ and $T_2 \circ T_1$ being (pointwise) order-preserving, we arrive at
\[
u = T_2 \circ T_1(v) \geq T_2 \circ T_1(C_{\text{max}} \overline{v}) = (C_{\text{max}})^{\frac{b_2}{q-1-a_2} \cdot \frac{b_1}{p-1-a_1} \overline{v}}. \quad (3.62)
\]
From $0 < C_{\text{max}} < 1$ combined with the subhomogeneity condition (3.1) we deduce that
\[
C_{\text{max}}' \overset{\text{def}}{=} (C_{\text{max}})^{\frac{b_1}{p-1-a_1} \cdot \frac{b_2}{q-1-a_2}} > C_{\text{max}},
\]
which contradicts the maximality of the constant $C_{\text{max}}$ in (3.60), by inequalities (3.61) and (3.62). Then, $C_{\text{max}} \geq 1$ which entails $\overline{u} \leq u$ and $\overline{v} \leq v$ a.e. in $\Omega$. Interchanging the roles of $(u, v)$ and $(\overline{u}, \overline{v})$, we finally get $(u, v) = (\overline{u}, \overline{v})$ a.e. in $\Omega$.

Proof of Theorem 3.9 The proof is very similar to the proof of Theorem 3.7. So we omit it.

Proof of Theorem 3.10

Alternative 1: Assume that $a_1 + b_1 = k_1 - 1$ and $k_2 - 1 \leq a_2 + b_2 < q - 1$. We look for positive sub and supersolutions pairs $(u, v)$, $(\overline{u}, \overline{v})$ in the form:
\[
\overline{u} = m\psi_1 \quad \text{and} \quad \overline{\psi} = m^{-1}(\varphi_{1,p})^{1-\varepsilon} \quad \text{in } \Omega,
\]
\[
\overline{v} = m^\sigma \psi_2 \quad \text{and} \quad \overline{\psi} = m^{-\sigma}(\varphi_{1,q})^{1-\sigma\varepsilon} \quad \text{in } \Omega,
\]
where $\sigma > 0$ is given by (3.2), $\varepsilon < 1$ and $m < 1$ are appropriate positive constants small enough and $\psi_1 \in W^{1,p}_0(\Omega)$ and $\psi_2 \in W^{1,q}_0(\Omega)$ are the respective solutions to
\[
-\Delta_p w = K_1(x)w^{\delta_1} \quad \text{in } \Omega; \quad w|_{\partial\Omega} = 0, \quad w > 0 \quad \text{in } \Omega,
\]
Similarly, using estimate (3.63), we obtain
\[-\Delta_r [(\varphi_1, r)^\gamma] = \gamma^{r-1} [\lambda_1, r(\varphi_1, r)^{\gamma(r-1)} - (\gamma - 1)(r - 1)(\varphi_1, r)^{(\gamma-1)(r-1)-1}] |\nabla \varphi_1, r|'\]
in \(\Omega\). By estimate (1.5), we conclude that
\[-\Delta_r [(\varphi_1, r(x))^\gamma] \sim d(x)^{-1}(1-\gamma)(r-1)\quad \text{in } \Omega.\] (3.63)

So, let \((u, v) \in \overline{[\underline{u}, \ol{u}]} \times \overline{[\underline{v}, \ol{v}]}\). On one hand, we have
\[-\Delta_p u \leq m^{p-1} C_1 K_1(x) d(x)^{\delta_1} \quad \text{and} \quad -\Delta_q v \leq m^{q-1} C'_1 K_2(x) d(x)^{\delta_2} \quad \text{in } \Omega.\]

On the other hand, we also have
\[K_1(x)u^{a_1}v^{b_1} \geq \begin{cases} m^{a_1+\sigma b_1} K_1(x) \psi_1^{a_1} \psi_2^{b_1} & \text{if } b_1 > 0, \\ m^{a_1-\sigma b_1} K_1(x) \psi_1^{a_1} (\varphi_1, q)^{b_1(1-\varepsilon)} & \text{if } b_1 < 0, \end{cases}\]

in \(\Omega\). Similarly, we get
\[K_2(x)u^{a_2}v^{b_2} \geq m^{\sigma a_2 + |b_2|} C'_1 K_2(x) d(x)^{a_2 + b_2 + \varepsilon b_2} \quad \text{in } \Omega.\]

Then, for \(m\) and \(\varepsilon\) small enough, \((u, v)\) is a subsolutions pair of problem \((P)\). Similarly, using estimate (3.63), we obtain
\[-\Delta_p u \geq m^{1-p} C_3 d(x)^{-1-\varepsilon(p-1)} \quad \text{and} \quad -\Delta_q v \geq m^{\sigma(q-1)} C'_3 d(x)^{-1-\varepsilon\sigma(q-1)} \quad \text{in } \Omega.\]

Furthermore, by (3.5), for any \(\varepsilon' > 0\), there exists \(C_4 = C_4(\varepsilon') > 0\) such that
\[K_1(x)u^{a_1}v^{b_1} \leq \begin{cases} m^{-(a_1+\sigma b_1)} K_1(x) (\varphi_1, p)^{a_1(1-\varepsilon)} (\varphi_1, q)^{b_1(1-\varepsilon)} & \text{if } b_1 > 0, \\ m^{-(a_1-\sigma b_1)} K_1(x) (\varphi_1, p)^{a_1(1-\varepsilon)} \psi_2^{b_1} & \text{if } b_1 < 0, \end{cases}\]

in \(\Omega\),
Similarly, we have
\[ K_2(x)u^{a_2}v^{b_2} \leq m^{-(\sigma a_2 + |b_2|)}C_4'(x)^{-k_1 + a_2 + b_2 - \varepsilon(\sigma a_2 + b_2^2) - \varepsilon'} \quad \text{in } \Omega, \]
with \( C_4' = C_4'(\varepsilon'). \) Then, for \( m, \varepsilon \) and \( \varepsilon' \) small enough, \((\overline{u}, \overline{v})\) is a supersolutions pair of problem \((P)\). Applying Theorem 2.1, we get the existence of positive solutions \((u, v)\) satisfying (3.69). This proves (i) of Theorem 3.10.

**Alternative 2:** When \( k_1 - 1 \leq a_1 + b_1 < q - 1 \) and \( a_2 + b_2 = k_2 - 1 \), interchanging the role of \( u \) and \( v \), the proof of (ii) is the same as above.

**Alternative 3:** Assume that (3.41) is satisfied. To prove (3), we follow the proof in Alternative 1. We construct positive sub and supersolutions pairs \((u, v)\), \((\overline{u}, \overline{v})\) in the form
\[ u = m(\varphi_{1,p})^{\gamma + \varepsilon}, \quad \overline{u} = m^{-1}(\varphi_{1,p})^{\gamma - \varepsilon} \quad \text{and} \quad v = m^{\sigma} \psi, \quad \overline{v} = m^{-\sigma}(\varphi_{1,q})^{1 - \sigma \varepsilon} \quad \text{in } \Omega, \]
where \( \sigma > 0 \) is given by (3.2), and \( \varepsilon, m \) are appropriate positive constants small enough and \( \psi \in W^{1,q}_0(\Omega) \) is the solution (see Theorem 3.3) of
\[ -\Delta_q w = K_2(x)w^{\delta} \quad \text{in } \Omega; \quad w|_{\partial \Omega} = 0, \quad w > 0 \quad \text{in } \Omega, \]
with \( a_2 + \gamma b_2 < \delta < q - 1 \). (iv) is the symmetric case of (3) by interchanging the role of \( u \) and \( v \). Finally, from Theorem A.1, we get the Hölder regularity of \((u, v)\).

\[ \square \]

### 3.2 Example 2

We consider now the following singular system
\[
(P) \quad \begin{cases}
-\Delta_p u = u^{a_1}v^{b_1} - u^{\alpha_1}v^{\beta_1} & \text{in } \Omega; \quad u|_{\partial \Omega} = 0, \quad u > 0 \quad \text{in } \Omega, \\
-\Delta_q v = v^{a_2}u^{b_2} - v^{\alpha_2}u^{\beta_2} & \text{in } \Omega; \quad v|_{\partial \Omega} = 0, \quad v > 0 \quad \text{in } \Omega,
\end{cases}
\]
where the above exponents satisfy
\[ (p - 1 - a_1) - \sigma |b_1| > 0 \quad \text{and} \quad (\alpha_1 - a_1) - \sigma(|\beta_1| - |b_1|) > 0, \quad (3.64) \]
\[ \sigma(q - 1 - a_2) - |b_2| > 0 \quad \text{and} \quad \sigma(\alpha_2 - a_2) - (|\beta_2| - |b_2|) > 0, \quad (3.65) \]
for some constant \( \sigma > 0 \). Then, we have the following result:

**Theorem 3.11.**
(i) Let
\[
\gamma_1 = \frac{p(q - 1 - a_2) + qb_1}{(p - 1 - a_1)(q - 1 - a_2) - b_1b_2}, \quad \gamma_2 = \frac{q(p - 1 - a_1) + pb_2}{(p - 1 - a_1)(q - 1 - a_2) - b_1b_2}
\]  
(3.66)
and assume that
\[
1 - \frac{1}{p} < \gamma_1 < 1 \quad \text{and} \quad (\alpha_1 - a_1)\gamma_1 + (\beta_1 - b_1)\gamma_2 > 0,
\]  
(3.67)
\[
1 - \frac{1}{q} < \gamma_2 < 1 \quad \text{and} \quad (\alpha_2 - a_2)\gamma_2 + (\beta_2 - b_2)\gamma_1 > 0.
\]  
(3.68)
Then, problem \((P)\) has a positive solution \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) satisfying
\[
u(x) \sim d(x)^{\gamma_1} \quad \text{and} \quad v(x) \sim d(x)^{\gamma_2} \quad \text{in} \ \Omega.
\]  
(3.69)
In addition, we have \((u, v) \in C^{0,\alpha}(\bar{\Omega}) \times C^{0,\alpha}(\bar{\Omega})\), for some \(0 < \alpha < 1\).

(ii) Assume that
\[
-1 < a_1 + b_1 < p - 1 \quad \text{and} \quad (\alpha_1 - a_1) + (\beta_1 - b_1) > 0,
\]  
(3.70)
\[
-1 < a_2 + b_2 < q - 1 \quad \text{and} \quad (\alpha_2 - a_2) + (\beta_2 - b_2) > 0.
\]  
(3.71)
Then, \((P)\) has a positive solution \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) satisfying
\[
u(x) \sim d(x) \quad \text{and} \quad v(x) \sim d(x) \quad \text{in} \ \Omega.
\]  
(3.72)
In addition, we have \((u, v) \in C^{1,\alpha}(\bar{\Omega}) \times C^{1,\alpha}(\bar{\Omega})\), for some \(0 < \alpha < 1\).

(iii) Let
\[
\gamma = \frac{p + b_1}{p - 1 - a_1}
\]  
(3.73)
and assume that
\[
1 - \frac{1}{p} < \gamma < 1 \quad \text{and} \quad (\alpha_1 - a_1)\gamma + (\beta_1 - b_1) > 0,
\]  
(3.74)
\[
-1 < a_2 + b_2 \gamma < p - 1 \quad \text{and} \quad (\alpha_2 - a_2) + (\beta_2 - b_2)\gamma > 0.
\]  
(3.75)
Then, \((P)\) has a positive solution \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) satisfying
\[
u(x) \sim d(x)^{\gamma} \quad \text{and} \quad v(x) \sim d(x) \quad \text{in} \ \Omega.
\]  
(3.76)
In addition, we have \((u, v) \in C^{0,\alpha}(\bar{\Omega}) \times C^{1,\alpha}(\bar{\Omega})\), for some \(0 < \alpha < 1\).
(iv) Symmetrically, set
\[ \gamma = \frac{q + b_2}{q - 1 - a_2} \quad (3.77) \]

and assume that
\[ -1 < a_1 + b_1 \gamma < p - 1 \quad \text{and} \quad (\alpha_1 - a_1) + (\beta_1 - b_1) \gamma > 0, \quad (3.78) \]
\[ 1 - \frac{1}{q} < \gamma < 1 \quad \text{and} \quad (\alpha_2 - a_2) \gamma + (\beta_2 - b_2) > 0. \quad (3.79) \]

Then, \((P)\) has a positive solution \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) satisfying
\[ u(x) \sim d(x) \quad \text{and} \quad v(x) \sim d(x)^\gamma \quad \text{in} \ \Omega. \quad (3.80) \]

In addition, we have \((u, v) \in C^{1,\alpha}(\overline{\Omega}) \times C^{0,\alpha}(\overline{\Omega})\), for some \(0 < \alpha < 1\).

**Proof.** We apply Theorem 2.1 with
\[ u \equiv m \psi_1, \quad \overline{u} \equiv m^{-1} \psi_1 \quad \text{and} \quad v \equiv m^{\sigma} \psi_2, \quad \overline{v} \equiv m^{-\sigma} \psi_2 \quad \text{in} \ \Omega, \]
where \(\sigma > 0\) is the constant given in (3.64) and (3.65), \(m < 1\) is a positive constant small enough and \(\psi_1 \in W^{1,p}_0(\Omega), \psi_2 \in W^{1,q}_0(\Omega)\) are given by Theorem 3.3 as the respective unique solutions of problems
\[ -\Delta_p w = w^{\delta_1} \quad \text{in} \ \Omega; \quad w|_{\partial \Omega} = 0, \quad w > 0 \quad \text{in} \ \Omega, \]
\[ -\Delta_q w = w^{\delta_2} \quad \text{in} \ \Omega; \quad w|_{\partial \Omega} = 0, \quad w > 0 \quad \text{in} \ \Omega, \]
satisfying some cone conditions we precise below. In the following **Alternatives**, we choose
\[ -2 - \frac{1}{p-1} < \delta_1 < p - 1 \quad \text{and} \quad -2 - \frac{1}{q-1} < \delta_2 < q - 1 \quad \text{such that} \]
\[ -\Delta_p \psi_1 \sim \psi_1^{a_1} \psi_2^{b_1} \quad \text{and} \quad -\Delta_q \psi_2 \sim \psi_2^{a_2} \psi_1^{b_2} \quad \text{in} \ \Omega. \quad (3.81) \]

**Alternative 1:** Assume that conditions (3.67) and (3.68) hold. Then, arguing as in **Alternative 1** in the proof of Theorem 3.7, we choose \(-2 - \frac{1}{p-1} < \delta_1 < -1 \quad \text{and} \quad -2 - \frac{1}{q-1} < \delta_2 < -1 \) unique solutions pair of the following system:
\[ \frac{\delta_1 p}{p - 1 - \delta_1} = \frac{a_1 p}{p - 1 - \delta_1} + \frac{b_1 q}{q - 1 - \delta_2} \quad \text{and} \quad \frac{\delta_2 q}{q - 1 - \delta_2} = \frac{a_2 q}{q - 1 - \delta_2} + \frac{b_2 p}{p - 1 - \delta_2}. \]

Since
\[ \psi_1(x) \sim d(x)^{\gamma_1} \quad \text{and} \quad \psi_2(x) \sim d(x)^{\gamma_2} \quad \text{in} \ \Omega, \]
where \( \gamma_1 = \frac{p-1}{p-\delta_1} \) and \( \gamma_2 = \frac{q-1}{q-\delta_2} \) are given by (3.66), estimates (3.81) follows. Let \((u, v) \in [u, \overline{u}] \times [v, \overline{v}]\). First, we have

\[
-\Delta_p u \leq m^{p-1} C_1 d(x)^{\delta_1 \gamma_1} \quad \text{and} \quad -\Delta_q v \leq m^{\sigma(q-1)} C'_1 d(x)^{\delta_2 \gamma_2} \quad \text{in} \ \Omega. \tag{3.82}
\]

On the other hand, by (3.64) and (3.67),

\[
\overline{u}^{a_1} v^{b_1} - u^{a_1} v^{b_1} \geq m^{a_1 + \sigma |b_1|} \psi_1^{a_1} \psi_2^{b_1} \left[ 1 - m^{\alpha_1 - a_1 - \sigma(|\beta_1| - |b_1|)} \psi_1^{\alpha_1 - a_1} \psi_2^{\beta_1 - b_1} \right]
\geq m^{a_1 + \sigma |b_1|} C_2 d(x)^{a_1 \gamma_1 + b_1 \gamma_2} \quad \text{in} \ \Omega. \tag{3.83}
\]

for \( m \) small enough. By (3.65) and (3.68), we also have

\[
\overline{v}^{a_2} u^{b_2} - v^{a_2} u^{b_2} \geq m^{\sigma a_2 + |b_2|} C'_2 d(x)^{a_2 \gamma_2 + b_2 \gamma_1} \quad \text{in} \ \Omega, \tag{3.84}
\]

for \( m \) small enough. Then, under conditions (3.64), (3.65), (3.67) and (3.68) and for \( m \) small enough, \((u, v)\) is a subsolutions pair of problem \((P)\).

Similarly, we have

\[
-\Delta_p \overline{u} \geq m^{1-p} C_3 d(x)^{\delta_1 \gamma_1} \quad \text{and} \quad -\Delta_q \overline{v} \geq m^{\sigma(1-q)} C'_3 d(x)^{\delta_2 \gamma_2} \quad \text{in} \ \Omega. \tag{3.85}
\]

In addition,

\[
\overline{u}^{a_1} v^{b_1} - \overline{u}^{a_1} v^{b_1} \leq m^{-a_1 - \sigma |b_1|} \psi_1^{a_1} \psi_2^{b_1} \leq m^{-a_1 - \sigma |b_1|} C_4 d(x)^{a_1 \gamma_1 + b_1 \gamma_2} \tag{3.86}
\]

in \( \Omega \). We obtain further

\[
\overline{v}^{a_2} u^{b_2} - \overline{v}^{a_2} u^{b_2} \leq m^{-\sigma a_2 - |b_2|} C'_4 d(x)^{a_2 \gamma_2 + b_2 \gamma_1} \quad \text{in} \ \Omega. \tag{3.87}
\]

Then, under conditions (3.64), (3.65) and for \( m \) small enough, \((u, v)\) is a supersolutions pair of problem \((P)\).

Applying Theorem 2.1, we get the existence of positive solutions \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) of \((P)\) satisfying (3.69). Again from Theorem A.1, \((u, v)\) are Hölder continuous. This proves the assertion (i).

**Alternative 2**: Now, assume that conditions (3.70) and (3.71) are satisfied. Then, we choose \( \delta_1 = a_1 + b_1 \) and \( \delta_2 = a_2 + b_2 \). By Theorem 3.3, since

\[
\psi_1(x) \sim d(x) \quad \text{and} \quad \psi_2(x) \sim d(x) \quad \text{in} \ \Omega,
\]
estimates (3.81) hold. Instead of inequalities (3.82), we have in this case

\[
-\Delta_p u \leq m^{p-1} C_1 d(x)^{a_1 + b_1} \quad \text{and} \quad -\Delta_q v \leq m^{\sigma(q-1)} C'_1 d(x)^{a_2 + b_2} \quad \text{in} \ \Omega.
\]
From (3.64), (3.65), (3.70) and (3.71), we get for any \((u, v) \in [\overline{u}, \overline{v}] \times [\underline{v}, \underline{v}]\):

\[
\begin{align*}
\overline{u}^{a_1} v^{b_1} - \underline{u}^{a_1} v^{\beta_1} & \geq m^{a_1+\sigma|b_1|} C_2 d(x)^{a_1+b_1} \quad \text{in } \Omega, \\
\underline{v}^{a_2} u^{b_2} - \overline{v}^{a_2} u^{\beta_2} & \geq m^{\sigma a_2+|b_2|} C'_2 d(x)^{a_2+b_2} \quad \text{in } \Omega,
\end{align*}
\]

for \(m\) small enough. Then, under conditions (3.64), (3.65), (3.70), (3.71) and for \(m\) small enough, \((u, v)\) is a subsolution pair of problem \((P)\). Instead of inequalities (3.85), we have in this case in \(\Omega\),

\[-\Delta_p \overline{u} \geq m^{1-p} C_3 d(x)^{a_1+b_1} \quad \text{and} \quad -\Delta_q \underline{v} \geq m^{\sigma(1-q)} C'_3 d(x)^{a_2+b_2}.
\]

In addition, instead of inequalities (3.86) and (3.87), we get

\[
\begin{align*}
\overline{u}^{a_1} v^{b_1} - \underline{u}^{a_1} v^{\beta_1} & \leq m^{-a_1-\sigma|b_1|} C_4 d(x)^{a_1+b_1}, \\
\overline{v}^{a_2} u^{b_2} - \underline{v}^{a_2} u^{\beta_2} & \leq m^{-\sigma a_2-|b_2|} C'_4 d(x)^{a_2+b_2},
\end{align*}
\]

in \(\Omega\). Then, under conditions (3.64), (3.65) and for \(m\) small enough, \((\overline{u}, \overline{v})\) is a supersolution pair of problem \((P)\). Then, we conclude as in the *Alternative 1* and (ii) is proved.

**Alternative 3:** Now, assume conditions (3.74) and (3.75) hold. Then, arguing as in the proof of Theorem 3.7, we choose \(-2 - \frac{1}{p} < \delta_1 < -1\) and \(-1 < \delta_2 < q - 1\) unique solutions pair of the following system:

\[
\frac{\delta_1 p}{p - 1 - \delta_1} = \frac{a_1 p}{p - 1 - \delta_1} + b_1 \quad \text{and} \quad \delta_2 = a_2 + \frac{b_2 p}{p - 1 - \delta_2}.
\]

Estimates in (3.81) hold since

\[
\psi_1(x) \sim d(x)^\gamma \quad \text{and} \quad \psi_2(x) \sim d(x) \quad \text{in } \Omega,
\]

with \(\gamma\) given by (3.73). Instead of inequalities (3.82), we have in this case

\[-\Delta_p \overline{u} \leq m^{p-1} C_1 d(x)^{\delta_1 \gamma} \quad \text{and} \quad -\Delta_q \underline{v} \leq m^{\sigma(q-1)} C'_1 d(x)^{\delta_2} \quad \text{in } \Omega.
\]

From (3.64), (3.65), (3.74) and (3.75), we obtain now

\[
\begin{align*}
\overline{u}^{a_1} v^{b_1} - \underline{u}^{a_1} v^{\beta_1} & \geq m^{a_1+\sigma|b_1|} C_2 d(x)^{a_1+b_1} \quad \text{in } \Omega, \\
\underline{v}^{a_2} u^{b_2} - \overline{v}^{a_2} u^{\beta_2} & \geq m^{\sigma a_2+|b_2|} C'_2 d(x)^{a_2+b_2} \quad \text{in } \Omega,
\end{align*}
\]

for \(m\) small enough. Then, under conditions (3.64), (3.65), (3.74), (3.75) and for \(m\) small enough, \((\overline{u}, \overline{v})\) is a subsolution pair of problem \((P)\). Instead of (3.85), we have

\[
-\Delta_p \overline{u} \geq m^{1-p} C_3 d(x)^{\delta_1 \gamma} \quad \text{and} \quad -\Delta_q \underline{v} \geq m^{\sigma(1-q)} C'_3 d(x)^{\delta_2} \quad \text{in } \Omega.
\]
And inequalities (3.86) are replaced by
\[
\bar{u}^{a_1} v^{b_1} - \bar{u}^{a_1} v^{b_1} \leq m^{-a_1 - |b_1|} C_4 d(x)^{a_1 \gamma + b_1} \quad \text{in } \Omega,
\]
\[
\bar{u}^{a_2} u^{b_2} - \bar{u}^{a_2} u^{b_2} \leq m^{-a_2 - |b_2|} C_4' d(x)^{a_2 + b_2 \gamma} \quad \text{in } \Omega.
\]
Then, under conditions (3.64), (3.65) and for \( m \) small enough, \((\bar{u}, \bar{v})\) is a supersolution pair of problem \((P)\). We conclude as in the Alternative 1. Thus, (iii) is proved. Note that (iv) is the symmetric case of (iii) by interchanging \( u \) and \( v \).

We can further prove similarly (we omit the proof):

**Theorem 3.12.** Assume that conditions (3.64) and (3.65) are satisfied.

(i) Assume that
\[
a_1 + b_1 = -1 \quad \text{and} \quad (\alpha_1 - a_1) + (\beta_1 - b_1) > 0, \tag{3.88}
\]
\[
-1 \leq a_2 + b_2 < q - 1 \quad \text{and} \quad (\alpha_2 - a_2) + (\beta_2 - b_2) > 0. \tag{3.89}
\]
Then, for all \( \varepsilon > 0 \) small enough, there exist \( C_1, C_2 > 0 \) and \( C'_1, C'_2 > 0 \) such that \((P)\) admits positive solutions \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) satisfying:
\[
C_1 d(x) \leq u \leq C_2 d(x)^{1-\varepsilon} \quad \text{and} \quad C'_1 d(x) \leq v \leq C'_2 d(x)^{1-\varepsilon} \quad \text{in } \Omega, \tag{3.90}
\]
with \( \sigma > 0 \) is given in (3.2). In addition, we have \((u, v) \in \mathcal{C}^{0,\alpha}(\bar{\Omega}) \times \mathcal{C}^{0,\alpha}(\bar{\Omega})\), for some \( 0 < \alpha < 1 \).

(ii) Symmetrically, assume that
\[
-1 \leq a_1 + b_1 < q - 1 \quad \text{and} \quad (\alpha_1 - a_1) + (\beta_1 - b_1) > 0, \tag{3.91}
\]
\[
a_2 + b_2 = -1 \quad \text{and} \quad (\alpha_2 - a_2) + (\beta_2 - b_2) > 0. \tag{3.92}
\]
Then, for all \( \varepsilon > 0 \) small enough, there exist \( C_1, C_2 > 0 \) and \( C'_1, C'_2 > 0 \) such that \((P)\) admits positive solutions \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) satisfying:
\[
C_1 d(x) \leq u \leq C_2 d(x)^{1-\varepsilon} \quad \text{and} \quad C'_1 d(x) \leq v \leq C'_2 d(x)^{1-\varepsilon} \quad \text{in } \Omega. \tag{3.93}
\]
In addition, we have \((u, v) \in \mathcal{C}^{0,\alpha}(\bar{\Omega}) \times \mathcal{C}^{0,\alpha}(\bar{\Omega})\), for some \( 0 < \alpha < 1 \).

(iii) Let
\[
\gamma = \frac{p + b_1}{p - 1 - a_1}
\]
and assume that
\[
1 - \frac{1}{p} < \gamma < 1 \quad \text{and} \quad (\alpha_1 - a_1)\gamma + (\beta_1 - b_1) > 0, \tag{3.94}
\]
\[ a_2 + b_2 \gamma = -1 \quad \text{and} \quad (\alpha_2 - a_2) + (\beta_2 - b_2) \gamma > 0. \quad (3.95) \]

Then, for all \( \varepsilon > 0 \) small enough, there exist \( C_1, C_2 > 0 \) and \( C'_1, C'_2 > 0 \) such that (P) admits positive solutions \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) satisfying:

\[ C_1 d(x)^{\gamma + \varepsilon} \leq u \leq C_2 d(x)^{\gamma - \varepsilon} \quad \text{and} \quad C'_1 d(x)^{\gamma + \varepsilon} \leq v \leq C'_2 d(x)^{\gamma - \varepsilon} \quad \text{in } \Omega. \quad (3.96) \]

In addition, we have \((u, v) \in C^{0,\alpha}(\overline{\Omega}) \times C^{0,\alpha}(\overline{\Omega})\), for some \( 0 < \alpha < 1 \).

(iv) Symmetrically, let

\[ \gamma = \frac{q + b_2}{q - 1 - a_2} \]

and assume that

\[ a_1 + b_1 \gamma = -1 \quad \text{and} \quad (\alpha_1 - a_1) + (\beta_1 - b_1) \gamma > 0, \quad (3.97) \]

\[ 1 - \frac{1}{q} < \gamma < 1 \quad \text{and} \quad (\alpha_2 - a_2) \gamma + (\beta_2 - b_2) > 0. \quad (3.98) \]

Then, for all \( \varepsilon > 0 \) small enough, there exist \( C_1, C_2 > 0 \) and \( C'_1, C'_2 > 0 \) such that (P) admits positive solutions \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) satisfying:

\[ C_1 d(x) \leq u \leq C_2 d(x)^{1-\varepsilon} \quad \text{and} \quad C'_1 d(x)^{\gamma + \varepsilon} \leq v \leq C'_2 d(x)^{\gamma - \varepsilon} \quad \text{in } \Omega. \quad (3.99) \]

In addition, we have \((u, v) \in C^{0,\alpha}(\overline{\Omega}) \times C^{0,\alpha}(\overline{\Omega})\), for some \( 0 < \alpha < 1 \).

### 3.3 Example 3

In this section, we consider the following singular competition system

\[
\begin{align*}
(P) \quad & \begin{cases} 
-\Delta_p u = \lambda_1 u^{\alpha_1} - u^{\beta_1} - \mu_1 u^{a_1} v^{b_1} & \text{in } \Omega; \quad u|_{\partial \Omega} = 0, \quad u > 0 \quad \text{in } \Omega, \\
-\Delta_q v = \lambda_2 v^{\alpha_2} - v^{\beta_2} - \mu_2 v^{a_2} u^{b_2} & \text{in } \Omega; \quad v|_{\partial \Omega} = 0, \quad v > 0 \quad \text{in } \Omega,
\end{cases}
\end{align*}
\]

where \( \lambda_1, \lambda_2 \) and \( \mu_1, \mu_2 \) are positive and \( \alpha_1, \alpha_2, \beta_1, \beta_2, a_1, a_2, b_1, b_2 \) satisfy

\[ -2 - \frac{1}{p - 1} < \alpha_1 < p - 1, \quad \alpha_1 < \beta_1 \quad \text{and} \quad a_1 - \alpha_1 - \sigma|b_1| > 0, \quad (3.100) \]

\[ -2 - \frac{1}{q - 1} < \alpha_2 < q - 1, \quad \alpha_2 < \beta_2 \quad \text{and} \quad \sigma(a_2 - \alpha_2) - |b_2| > 0, \quad (3.101) \]

for some constant \( \sigma > 0 \). Then, we have
Theorem 3.13.  \( \text{(i) Assume that} \)

\[-2 - \frac{1}{p-1} < \alpha_1 < -1 \quad \text{and} \quad \frac{(a_1 - \alpha_1)p}{p - 1 - \alpha_1} + \frac{b_1 q}{q - 1 - \alpha_2} > 0, \quad (3.102)\]

\[-2 - \frac{1}{q-1} < \alpha_2 < -1 \quad \text{and} \quad \frac{(a_2 - \alpha_2)q}{q - 1 - \alpha_2} + \frac{b_2 p}{p - 1 - \alpha_1} > 0. \quad (3.103)\]

Then, (P) admits positive solutions \((u, v) \in W_0^{1,p}(\Omega) \times W_0^{1,q}(\Omega)\) satisfying:

\[u(x) \sim d(x)^{-\frac{p}{p-1-\alpha_1}} \quad \text{and} \quad v(x) \sim d(x)^{-\frac{q}{q-1-\alpha_2}} \quad \text{in} \ \Omega. \quad (3.104)\]

In addition, we have \((u, v) \in C^{0,\alpha}(\overline{\Omega}) \times C^{0,\alpha}(\overline{\Omega})\), for some \(0 < \alpha < 1\).

\(\text{(ii) Assume that} \)

\[-1 < \alpha_1 < p - 1 \quad \text{and} \quad a_1 - \alpha_1 + b_1 > 0, \quad (3.105)\]

\[-1 < \alpha_2 < q - 1 \quad \text{and} \quad a_2 - \alpha_2 + b_2 > 0. \quad (3.106)\]

Then, (P) admits positive solutions \((u, v) \in W_0^{1,p}(\Omega) \times W_0^{1,q}(\Omega)\) satisfying:

\[u(x) \sim d(x) \quad \text{and} \quad v(x) \sim d(x) \quad \text{in} \ \Omega. \quad (3.107)\]

In addition, we have \((u, v) \in C^{1,\alpha}(\overline{\Omega}) \times C^{1,\alpha}(\overline{\Omega})\), for some \(0 < \alpha < 1\).

\(\text{(iii) Assume that} \)

\[-2 - \frac{1}{p-1} < \alpha_1 < -1 \quad \text{and} \quad (a_1 - \alpha_1 + b_1)p - b_1(\alpha_1 + 1) > 0, \quad (3.108)\]

\[-1 < \alpha_2 < q - 1 \quad \text{and} \quad (a_2 - \alpha_2 + b_2)p - (a_2 - \alpha_2)(\alpha_1 + 1) > 0. \quad (3.109)\]

Then, (P) admits positive solutions \((u, v) \in W_0^{1,p}(\Omega) \times W_0^{1,q}(\Omega)\) satisfying:

\[u(x) \sim d(x)^{-\frac{p}{p-1-\alpha_1}} \quad \text{and} \quad v(x) \sim d(x) \quad \text{in} \ \Omega. \quad (3.110)\]

In addition, we have \((u, v) \in C^{0,\alpha}(\overline{\Omega}) \times C^{1,\alpha}(\overline{\Omega})\), for some \(0 < \alpha < 1\).

\(\text{(iv) Symmetrically, assume that} \)

\[-1 < \alpha_1 < p - 1 \quad \text{and} \quad (a_1 - \alpha_1 + b_1)q - (a_1 - \alpha_1)(\alpha_2 + 1) > 0, \quad (3.111)\]

\[-2 - \frac{1}{q-1} < \alpha_2 < -1 \quad \text{and} \quad (a_2 - \alpha_2 + b_2)q - b_2(\alpha_2 + 1) > 0. \quad (3.112)\]

Then, (P) admits positive solutions \((u, v) \in W_0^{1,p}(\Omega) \times W_0^{1,q}(\Omega)\) satisfying:

\[u(x) \sim d(x) \quad \text{and} \quad v(x) \sim d(x)^{-\frac{q}{q-1-\alpha_2}} \quad \text{in} \ \Omega. \quad (3.113)\]

In addition, we have \((u, v) \in C^{1,\alpha}(\overline{\Omega}) \times C^{0,\alpha}(\overline{\Omega})\), for some \(0 < \alpha < 1\).
\textbf{Proof.} We apply Theorem 2.1 with
\begin{equation}
u \equiv m \psi_1, \quad \overline{\nu} \equiv m^{-1} \psi_1 \quad \text{and} \quad \overline{\nu} \equiv m^\sigma \psi_2, \quad \overline{\nu} \equiv m^{-\sigma} \psi_2 \quad \text{in} \quad \Omega, \quad (3.114)
\end{equation}
where \( \sigma > 0 \) is the constant given in (3.100) and (3.101), \( m < 1 \) is a suitable small positive constant and \( \psi_1 \in W^{1,p}_0(\Omega), \psi_2 \in W^{1,q}_0(\Omega) \) are (given by Theorem 3.3) the respective unique solutions of problems
\begin{align*}
-\Delta_p w &= w^{\alpha_1} \quad \text{in} \quad \Omega; \quad w|_{\partial\Omega} = 0, \quad w > 0 \quad \text{in} \quad \Omega, \\
-\Delta_q w &= w^{\alpha_2} \quad \text{in} \quad \Omega; \quad w|_{\partial\Omega} = 0, \quad w > 0 \quad \text{in} \quad \Omega.
\end{align*}

\textbf{Alternative 1:} Assume conditions (3.102) and (3.103) are satisfied. Then, from Theorem 3.3, we get
\begin{equation}
\psi_1(x) \sim d(x)|^{\frac{p}{p-1-\alpha_1}} \quad \text{and} \quad \psi_2(x) \sim d(x)|^{\frac{q}{q-1-\alpha_2}} \quad \text{in} \quad \Omega.
\end{equation}

Let us prove that, for \( m \) small enough, \((u, v)\) and \((\overline{\nu}, \overline{\nu})\) are respectively sub and supersolutions pairs of \((P)\). Let \((u, v) \in [u, \overline{\nu}] \times [\overline{\nu}, \overline{\nu}]\). We have in \( \Omega \),
\begin{equation}
-\Delta_p u \leq m^{p-1} C_1 d(x)|^{\frac{\alpha_1 p}{p-1-\alpha_1}} \quad \text{and} \quad -\Delta_q u \leq m^{\sigma(q-1)} C'_1 d(x)|^{\frac{\alpha_2 q}{q-1-\alpha_2}}. \quad (3.115)
\end{equation}

From (3.100) and (3.102), we obtain:
\begin{align}
\lambda_1 u^{\alpha_1} - u^{\beta_1} - \mu_1 u^{\alpha_1} v^{b_1} &\geq \lambda_1 (m \psi_1)^{\alpha_1} \left[ 1 - \frac{1}{\lambda_1} (m \psi_1)^{\beta_1-\alpha_1} - \mu_1 (m \psi_1)^{\alpha_1-\alpha_1} (m^{-\sigma \text{sign}(b_1)} \psi_2)^{b_1} \right] \\
&\geq \frac{\lambda_1}{2} m^{\alpha_1} C_2 d(x)|^{\frac{\alpha_1 p}{p-1-\alpha_1}}, \quad (3.116)
\end{align}

for \( m \) small enough. In addition, from (3.101) and (3.103), we get:
\begin{equation}
\lambda_2 u^{\alpha_2} - u^{\beta_2} - \mu_2 u^{\alpha_2} u^{b_2} \geq \frac{\lambda_1}{2} m^{\sigma\alpha_2} C'_2 d(x)|^{\frac{\alpha_2 q}{q-1-\alpha_2}} \quad \text{in} \quad \Omega, \quad (3.117)
\end{equation}

for \( m \) small enough. Then, under conditions (3.102), (3.103) and for \( m \) small enough, \((u, v)\) is a subsolutions pair of problem \((P)\). We also get
\begin{align}
-\Delta_p \overline{\nu} &\geq m^{1-p} C_3 d(x)|^{\frac{\alpha_1 p}{p-1-\alpha_1}} \quad \text{and} \quad -\Delta_q \overline{\nu} \geq m^{\sigma(1-q)} C'_3 d(x)|^{\frac{\alpha_2 q}{q-1-\alpha_2}} \quad \text{in} \quad \Omega. \quad (3.118)
\end{align}

Similarly, one has
\begin{equation}
\lambda_1 \overline{\nu}^{\alpha_1} - \overline{\nu}^{\beta_1} - \mu_1 \overline{\nu}^{\alpha_1} v^{b_1} \leq \lambda_1 m^{-\alpha_1} C_4 d(x)|^{\frac{\alpha_1 p}{p-1-\alpha_1}} \quad \text{in} \quad \Omega, \quad (3.119)
\end{equation}
\[ \lambda_2 \overline{v}^{\alpha_2} - \overline{v}^{\beta_2} - \mu_2 \overline{u}^{\alpha_2} u^{b_2} \leq \lambda_2 m^{-\sigma \alpha_2} C_4 d(x)^{\frac{\alpha_2 q}{q-1-\alpha_2}} \text{ in } \Omega. \] (3.120)

Then, for \( m \) small enough, \((\overline{u}, \overline{v})\) is a supersolutions pair of problem \((P)\).

Applying Theorem 2.1, we get the existence of positive solutions \((u, v) \in W_0^{1, p}(\Omega) \times W_0^{1, q}(\Omega)\) of \((P)\) satisfying (3.104). From Theorem A.1, we get the H"older regularity of \( u \) and \( v \). This proves (i).

**Alternative 2:** Now, let conditions (3.105) and (3.106) be satisfied. Then,

\[ \psi_1(x) \sim d(x) \quad \text{and} \quad \psi_2(x) \sim d(x) \quad \text{in } \Omega. \]

Let \((u, v) \in [\underline{u}, \overline{u}] \times [\underline{v}, \overline{v}]\). Instead of (3.115), we now get

\[ -\Delta_p u \leq m^{p-1} C_1 d(x)^{\alpha_1} \quad \text{and} \quad -\Delta_q v \leq m^{q-1} C_1 d(x)^{\alpha_2} \quad \text{in } \Omega. \]

From (3.100), (3.101), (3.105) and (3.106), instead of (3.116) and (3.117), we have

\[ \lambda_1 \overline{u}^{\alpha_1} - \overline{u}^{\beta_1} - \mu_1 \overline{u}^{\alpha_1} u^{b_1} \geq \frac{\lambda_1}{2} m^{\alpha_1} C_2 d(x)^{\alpha_1} \quad \text{in } \Omega, \]

\[ \lambda_2 \overline{v}^{\alpha_2} - \overline{v}^{\beta_2} - \mu_2 \overline{v}^{\alpha_2} u^{b_2} \geq \frac{\lambda_2}{2} m^{\alpha_2} C_2 d(x)^{\alpha_2} \quad \text{in } \Omega, \]

for \( m \) small enough. Then, under conditions (3.105), (3.106) and for \( m \) small enough, \((u, v)\) is a subsolutions pair of problem \((P)\). Instead of (3.118), we have

\[ -\Delta_p \overline{u} \geq m^{1-p} C_3 d(x)^{\alpha_1} \quad \text{and} \quad -\Delta_q \overline{v} \geq m^{q-1} C_3 d(x)^{\alpha_2} \quad \text{in } \Omega. \]

Furthermore, the following inequalities

\[ \lambda_1 \overline{u}^{\alpha_1} - \overline{u}^{\beta_1} - \mu_1 \overline{u}^{\alpha_1} u^{b_1} \leq \lambda_1 m^{-\alpha_1} C_4 d(x)^{\alpha_1} \quad \text{in } \Omega, \]

\[ \lambda_2 \overline{v}^{\alpha_2} - \overline{v}^{\beta_2} - \mu_2 \overline{v}^{\alpha_2} u^{b_2} \leq \lambda_1 m^{-\alpha_2} C_4 d(x)^{\alpha_2} \quad \text{in } \Omega \]

replace (3.119) and (3.120). Then, for \( m \) small enough, \((\overline{u}, \overline{v})\) is a supersolutions pair of problem \((P)\). We conclude as in the Alternative 1 and (ii) is proved.

**Alternative 3:** Now, assume that conditions (3.108) and (3.109) are satisfied. Then,

\[ \psi_1(x) \sim d(x)^{\overline{p}^{p-1-\alpha_1}} \quad \text{and} \quad \psi_2(x) \sim d(x) \quad \text{in } \Omega. \]

Let \((u, v) \in [\underline{u}, \overline{u}] \times [\underline{v}, \overline{v}]\). Instead of (3.115), we have

\[ -\Delta_p u \leq m^{p-1} C_1 d(x)^{\overline{p}^{p-1-\alpha_1}} \quad \text{and} \quad -\Delta_q v \leq m^{q-1} C_1 d(x)^{\alpha_2} \quad \text{in } \Omega. \]

From (3.100), (3.101), (3.108) and (3.109), instead of (3.116) and (3.117), we get

\[ \lambda_1 \overline{u}^{\alpha_1} - \overline{u}^{\beta_1} - \mu_1 \overline{u}^{\alpha_1} u^{b_1} \geq \frac{\lambda_1}{2} m^{\alpha_1} C_2 d(x)^{\overline{p}^{p-1-\alpha_1}} \quad \text{in } \Omega, \]
\[ \lambda_2 u^{\alpha_2} - v^{\beta_2} - \mu_2 u^{\alpha_2}v^{b_2} \geq \frac{\lambda_2}{2} m^{\sigma_{\alpha_2}} C_2 d(x)^{\alpha_2} \quad \text{in } \Omega, \]

for \( m \) small enough. Then, under conditions (3.108), (3.109) and for \( m \) small enough, \((u, v)\) is a subsolutions pair of problem \((P)\). Finally, Instead of (3.118), we have

\[ -\Delta_p u \geq m^{1-p} C_3 d(x)^{p-1-q} \quad \text{and} \quad -\Delta_q v \geq m^{\sigma(1-q)} C_3 d(x)^{\alpha_2} \quad \text{in } \Omega. \]

Instead of (3.119) and (3.120), we obtain

\[ \lambda_1 u^{\alpha_1} - \mu_1 u^{\alpha_1}v^{b_1} \leq \lambda_1 m^{-\alpha_1} C_4 d(x)^{p-1-q} \quad \text{in } \Omega, \]

\[ \lambda_2 v^{\beta_2} - \mu_2 u^{\alpha_2}v^{b_2} \leq \lambda_1 m^{-\sigma_{\alpha_2}} C_4 d(x)^{\alpha_2} \quad \text{in } \Omega. \]

Then, for \( m \) small enough, \((\bar{u}, \bar{v})\) is a supersolutions pair of problem \((P)\). Then, we conclude as in the Alternative 1. Thus, (iii) and by symmetry (iv) are proved.

Concerning the above theorem, we analyse further some limiting cases. The proof of the next result follows the proof of Theorem 3.10. So we omit it.

**Theorem 3.14.** (i) Let

\[ \alpha_1 = -1 \quad \text{and} \quad (a_1 - \alpha_1 + b_1) q - (a_1 - \alpha_1)(\alpha_2 + 1) > 0, \quad (3.121) \]

\[ -2 - \frac{1}{q-1} < \alpha_2 < -1 \quad \text{and} \quad (a_2 - \alpha_2 - b_2) q - b_2(\alpha_2 + 1) > 0. \quad (3.122) \]

Then, \((P)\) admits positive solutions \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) satisfying:

\[ u(x) \sim d(x)|\ln(d(x))|^{1/p} \quad \text{and} \quad v(x) \sim d(x)|\ln(d(x))|^{1/q-\alpha_2} \quad \text{in } \Omega. \quad (3.123) \]

In addition, we have \((u, v) \in C^{0,\alpha}(\Omega) \times C^{0,\alpha}(\Omega), \) for some \(0 < \alpha < 1.\)

(ii) Let

\[ \alpha_1 = -1 \quad \text{and} \quad a_1 - \alpha_1 + b_1 > 0, \quad (3.124) \]

\[ \alpha_2 = -1 \quad \text{and} \quad a_2 - \alpha_2 + b_2 > 0. \quad (3.125) \]

Then, \((P)\) admits positive solutions \((u, v) \in W^{1,p}_0(\Omega) \times W^{1,q}_0(\Omega)\) satisfying:

\[ u(x) \sim d(x)|\ln(d(x))|^{1/p} \quad \text{and} \quad v(x) \sim d(x)|\ln(d(x))|^{1/q} \quad \text{in } \Omega. \quad (3.126) \]

In addition, we have \((u, v) \in C^{0,\alpha}(\Omega) \times C^{0,\alpha}(\Omega), \) for some \(0 < \alpha < 1.\)
(iii) Let
\[ \alpha_1 = -1 \quad \text{and} \quad a_1 - \alpha_1 + b_1 > 0, \]
\[ -1 < \alpha_2 < q - 1 \quad \text{and} \quad a_2 - \alpha_2 + b_2 > 0. \]

Then, (P) admits positive solutions \((u, v) \in W_{0}^{1,p}(\Omega) \times W_{0}^{1,q}(\Omega)\) satisfying:
\[ u(x) \sim d(x) |\ln(d(x))|^{\frac{1}{p}} \quad \text{and} \quad v(x) \sim d(x) \quad \text{in} \ \Omega. \]

In addition, we have \((u, v) \in C^{0,\alpha}(\overline{\Omega}) \times C^{1,\alpha}(\overline{\Omega})\), for some \(0 < \alpha < 1\).

A A useful Hölder regularity result

We consider the following quasilinear elliptic boundary value problem,
\[-\Delta_r w = f \quad \text{in} \ \Omega; \quad w|_{\partial\Omega} = 0, \quad w > 0 \quad \text{in} \ \Omega. \quad (A.1)\]

In this equation, \(f\) is a \(L_{\text{loc}}^{1}(\Omega)\) function such that there exist two constants \(C > 0\) and \(\delta > 0\) satisfying
\[ |f(x)| \leq C d(x)^{-\delta}, \quad \text{a.e. in} \ \Omega. \quad (A.2)\]

Then, we have the following Hölder regularity result on the solutions to (A.1).

**Theorem A.1.** Assume that \(f\) satisfies the growth hypothesis (A.2). Let \(u \in W_{0}^{1,r}(\Omega)\) be a positive weak solution to (A.1). Let \(\overline{u} \in W_{0}^{1,r}(\Omega)\) be a supersolutions to (A.1) such that
\[-\Delta_r \overline{u} \geq |f| \quad \text{in} \ \Omega, \quad (A.3)\]
in the sense of distributions in \(W^{-1,r'}(\Omega)\). In addition, assume that there exists \(C' > 0\) such that
\[ 0 \leq u \leq \overline{u} \leq C' d(x)^{\delta'} \quad \text{a.e in} \ \Omega, \quad (A.4)\]
with \(0 < \delta' < \delta\). Finally, let \(\alpha\) be an arbitrary number such that
\[ 0 < \alpha < \frac{r}{r - 1 + \delta/\delta'} < 1. \]

Then, there exists a constant \(M > 0\), depending solely on \(\Omega, \ r\) and \(N\), on the constants \(C\) and \(\delta\) in (A.2), on the constants \(C'\) and \(\delta'\) in (A.4), and on the constant \(\alpha\), such that \(u \in C^{0,\alpha}(\overline{\Omega})\) and
\[ \|u\|_{C^{0,\alpha}(\overline{\Omega})} \leq M. \]
Proof. The proof is quite similar to the Theorem 1.1’s in [11] with $a : (x, \eta) \mapsto |\eta|^{p-2}\eta$ in $\Omega \times \mathbb{R}^N$. Indeed, to overcome the non-positivity of $f$, we add conditions (A.3) and (A.4). Then, introducing the same boundary value problem (2.12), instead of inequality (2.14), we get here

$$|u(x) - v(x)| \leq \varpi(x) \leq C x_N^{\delta'}$$

for all $x = (x', x_N) \in B^+_R(0)$. (A.5)

Then, estimate (A.18) still holds and the end of the proof is exactly the same.
