Abstract

We obtain a necessary condition and a sufficient condition, both expressed in terms of Wiener type tests involving the parabolic $W^{2,1}_q$-capacity, where $q' = \frac{q}{q-1}$ and $q > 1$, for the existence of large solutions to equation $\partial_t u - \Delta u + u^q = 0$ in a non-cylindrical domain. We provide also a sufficient condition for the existence of such solutions to equation $\partial_t u - \Delta u + e^{u} - 1 = 0$. Besides, we apply our results to equation: $\partial_t u - \Delta u + a|\nabla u|^p + bu^q = 0$ for $a, b > 0, 1 < p < 2$ and $q > 1$.

Keywords. Bessel capacities; Hausdorff capacities; parabolic boundary; Riesz potential; maximal solutions.

2010 Mathematics Subject Classification. 35K58, 28A12, 46E35.

1 Introduction

The aim of this paper is to study the problem of existence of large solutions to some nonlinear parabolic equations with superlinear absorption in an arbitrary bounded open set $O \subset \mathbb{R}^{N+1}$, $N \geq 2$. These are functions $u \in C^{2,1}(O)$, solutions of

$$\partial_t u - \Delta u + |u|^{q-1}u = 0 \quad \text{in } O,$$

$$\lim_{\delta \to 0} \inf_{O \cap Q_\delta(x,t)} u = \infty \quad \text{for all } (x,t) \in \partial_p O,$$

with $q > 1$ and

$$\partial_t u - \Delta u + \text{sign}(u)(e^{|u|} - 1) = 0 \quad \text{in } O,$$

$$\lim_{\delta \to 0} \inf_{O \cap Q_\delta(x,t)} u = \infty \quad \text{for all } (x,t) \in \partial_p O,$$

in which expressions $\partial_p O$ denotes the parabolic boundary of $O$, i.e. the set all points $X = (x,t) \in \partial O$ such that the intersection of the cylinder $Q_\delta(x,t) := B_\delta(x) \times (t-\delta^2, t)$ with $O^c$ is not empty for any $\delta > 0$. By the maximal principle for parabolic equations we can assume that all solutions of (1.1) and (1.2) are positive. Henceforth we consider only positive solutions of the preceding equations.

In [23], we studied the existence and the uniqueness of solution of semilinear heat equations in a cylindrical domain,

$$\partial_t u - \Delta u + f(u) = 0 \quad \text{in } \Omega \times (0, \infty),$$

$$u = \infty \quad \text{in } \partial_p (\Omega \times (0, \infty)),$$

1
where \( \Omega \) is a bounded open set in \( \mathbb{R}^N \) and \( f \) a continuous nondecreasing real-valued function such that \( f(0) \geq 0 \) and \( f(a) > 0 \) for some \( a > 0 \). In order to obtain the existence of a maximal solution of \( \partial_t u - \Delta u + f(u) = 0 \) in \( \Omega \times (0, \infty) \) there is need to introduce the following assumptions

\[
(i) \quad \int_a^\infty \left( \int_0^\tau f(\tau) \, d\tau \right)^{-\frac{1}{2}} \, d\tau < \infty, \\
(ii) \quad \int_a^\infty (f(s))^{-1} \, ds < \infty. 
\]

Condition (i), due to Keller and Osserman, is a necessary and sufficient for the existence of a maximal solution to

\[
-\Delta u + f(u) = 0 \quad \text{in } \Omega. 
\]

Condition (ii) is a necessary and sufficient for the existence of a maximal solution of the differential equation

\[
\varphi' + f(\varphi) = 0 \quad \text{in } (0, \infty),
\]

and this solution tends to \( \infty \) at \( 0 \). In [23], it is shown that if for any \( m \in \mathbb{R} \) there exists \( L = L(m) > 0 \) such that

for any \( x, y \geq m \Rightarrow f(x + y) \geq f(x) + f(y) - L, \)

and if (1.5) has a large solution, then (1.3) admits a solution.

It is not alway true that the maximal solution to (1.5) is a large solution. However, if \( f \) satisfies

\[
\int_1^\infty s^{-2(N-1)/(N-2)} f(s) \, ds < \infty \quad \text{if } N \geq 3,
\]

or

\[
\inf \left\{ a \geq 0 : \int_0^\infty f(s) e^{-as} \, ds < \infty \right\} < \infty \quad \text{if } N = 2,
\]

then (1.5) has a large solution for any bounded domain \( \Omega \), see [17].

When \( f(u) = u^q, \quad q > 1 \) and \( N \geq 3 \), the first above condition is satisfied if and only if \( q < q_c := \frac{N}{N-2} \), this is called the sub-critical case. When \( q \geq q_c \), a necessary and sufficient condition for the existence of a large solution to

\[
-\Delta u + u^q = 0 \quad \text{in } \Omega
\]

(1.7)

is expressed in term of a Wiener-type test,

\[
\int_0^1 \frac{\text{Cap}_{2,q'}(\Omega^c \cap B_r(x)) \, dr}{r^{N-2}} = \infty \quad \text{for all } \ x \in \partial \Omega.
\]

In the case \( q = 2 \) it is obtained by Dbersin and Le Gall [5], see also [13, 14], using probabilistic methods involving the Brownian snake; this method can be extended for \( 1 < q \leq 2 \) by using ideas from [8, 7]. In the general case the result is proved by Labutin, by purely analytic methods [12]. Note that \( q' = \frac{q}{q-1} \) and \( \text{Cap}_{2,q'} \) is the capacity associated to the Sobolev space \( W^{2,q'}(\mathbb{R}^N) \).

In [20] we obtain sufficient conditions for the existence of a large solution to

\[
-\Delta u + e^u - 1 = 0 \quad \text{in } \Omega,
\]

(1.9)
expressed in terms of the Hausdorff $\mathcal{H}_1^{N-2}$-capacity in $\mathbb{R}^N$, and more precisely
\begin{equation}
\int_0^1 \frac{\mathcal{H}_1^{N-2}(\Omega^c \cap B_r(x))}{r^{N-2}} dr = \infty \quad \text{for all} \ x \in \partial \Omega. \tag{1.10}
\end{equation}
We refer to [18] for investigation of the initial trace theory of (1.3).

In [9], Evans and Gariepy establish a Wiener criterion for the regularity of a boundary point (in the sense of potential theory) for the heat operator $L = \partial_t - \Delta$ in an arbitrary bounded set of $\mathbb{R}^{N+1}$. We denote by $\mathcal{M}(\mathbb{R}^{N+1})$ the set of Radon measures in $\mathbb{R}^{N+1}$ and, for any compact set $K \subset \mathbb{R}^{N+1}$, by $\mathcal{M}_K(\mathbb{R}^{N+1})$ the subset of $\mathcal{M}(\mathbb{R}^{N+1})$ of measures with support in $K$. Their positive cones are respectively denoted by $\mathcal{M}^+(\mathbb{R}^{N+1})$ and $\mathcal{M}^+_K(\mathbb{R}^{N+1})$. The capacity used in this criterion is the thermal capacity defined by
\begin{equation}
\text{Cap}_{\Omega}(K) = \sup\{\mu(K) : \mu \in \mathcal{M}_K(\mathbb{R}^{N+1}), \mathbb{H} * \mu \leq 1\},
\end{equation}
for any $K \subset \mathbb{R}^{N+1}$ compact, where $\mathbb{H}$ is the heat kernel in $\mathbb{R}^{N+1}$. It coincides with the parabolic Bessel $\mathcal{G}_1$-capacity $\text{Cap}_{\mathcal{G}_1}$,2:
\begin{equation}
\text{Cap}_{\mathcal{G}_1,2}(K) = \sup \left\{ \int_{\mathbb{R}^{N+1}} |f|^2 dx dt : f \in L^2(\mathbb{R}^{N+1}), \mathcal{G}_1 f \geq \chi_K \right\},
\end{equation}
here $\mathcal{G}_1$ is the parabolic Bessel kernel of first order, see [21, Remark 4.12]. Garofalo and Lanconelli [10] extend this result to the parabolic operator $L = \partial_t - \text{div}(A(x,t)\nabla)$, where $A(x,t) = (a_{i,j}(x,t))$, $i,j = 1,2,\ldots,N$ is a real, symmetric, matrix-valued function on $\mathbb{R}^{N+1}$ with $C^\infty$ entries satisfying
\begin{equation}
C^{-1} |\xi|^2 \leq \sum_{i,j=1}^N a_{i,j}(x,t)\xi_i \xi_j \leq C |\xi|^2 \quad \forall (x,t) \in \mathbb{R}^{N+1}, \forall \xi \in \mathbb{R}^N,
\end{equation}
for some constant $C > 0$.

Much less is known concerning the equation
\begin{equation}
\partial_t u - \Delta u + f(u) = 0 \tag{1.11}
\end{equation}
in a bounded open set $O \subset \mathbb{R}^{N+1}$, where $f$ is a continuous function in $\mathbb{R}$. Gargiepy and Ziemer [11, 24] prove that if there exist $(x_0,t_0) \in \partial_\rho O$, $l \in \mathbb{R}$ and a weak solution $u \in W^{1,2}(O) \cap L^\infty(O)$ of (1.11) such that $\eta(-l - \varepsilon + u)^+, \eta(l - \varepsilon - u)^+ \in W^{1,2}_0(O)$ for any $\varepsilon > 0$ and $\eta \in C_0^\infty(B_r(x_0) \times (-r^2 + t_0, r^2 + t_0))$ for some $r > 0$, and if there holds
\begin{equation}
\lim_{(x,t) \to (x_0,t_0)} u(x,t) = l. \tag{1.10}
\end{equation}
then $u \in W^{1,2}(O)$, and satisfies (1.4).

The main purpose of this article is to extend Labutin’s result [12] to the semilinear parabolic equation (1.1). Namely, we give a necessary and a sufficient condition for the existence of solutions to problem (1.1) in a bounded non-cylindrical domain $O \subset \mathbb{R}^{N+1}$, expressed in terms of a Wiener test based upon the parabolic $W^{2,1}_q$-capacity in $\mathbb{R}^{N+1}$. We also give a sufficient condition for solving problem (1.2) expressed in terms of a Wiener test based upon the parabolic Hausdorff $\mathcal{P}H^{2,1}_q$-capacity. These capacities are defined as follows: if $K \subset \mathbb{R}^{N+1}$ is a compact set, we set
\begin{equation}
\text{Cap}_{2,1,q}(K) = \inf \{ ||\varphi||_{W^{2,1}_q(\mathbb{R}^{N+1})}^q : \varphi \in \mathcal{S}(\mathbb{R}^{N+1}), \varphi \geq 1 \text{ in a neighborhood of } K \},
\end{equation}

It is easy to see that, for $0 < \sigma \leq \rho$ and $E \subset \mathbb{R}^{N+1}$, there holds
\[ C^{-1}\text{Cap}_{2,1,q'}(K) \leq \text{Cap}_{2,2,q'}(K) \leq C\text{Cap}_{2,1,q'}(K), \]
for some $C = C(N, q)$, where $\text{Cap}_{2,2,q'}$ is the parabolic Bessel $\mathcal{G}_2$-capacity, see [21].

For a set $E \subset \mathbb{R}^{N+1}$, we define $\mathcal{P}H^N_{\rho}(E)$ by
\[ \mathcal{P}H^N_{\rho}(E) = \inf \left\{ \sum_j r_j^N : E \subset \bigcup_j B_{r_j}(x_j) \times (t_j - r_j^2, t_j + r_j^2), r_j \leq \rho \right\}. \]

It is easy to see that, for $0 < \sigma \leq \rho$ and $E \subset \mathbb{R}^{N+1}$, there holds
\[ \mathcal{P}H^N_{\rho}(E) \leq \mathcal{P}H^N_{\sigma}(E) \leq C(N) \left( \frac{\rho}{\sigma} \right)^2 \mathcal{P}H^N_{\sigma}(E). \tag{1.12} \]

With these notations, we can state the two main results of this paper.

**Theorem 1.1** Let $N \geq 2$ and $q \geq q_* := \frac{N+2}{N}$. Then

(i) The equation
\[ \partial_t u - \Delta u + u^q = 0 \text{ in } O \tag{1.13} \]
admits a large solution if there holds
\[ \int_0^1 \frac{\text{Cap}_{2,1,q'}(O^c \cap (B_{\frac{\rho}{2}}(x) \times (t - 30\rho^2, t - \rho^2)))}{\rho^N} \rho \, d\rho = \infty, \tag{1.14} \]
for any $(x, t) \in \partial_p O$ and $q > q_*$ or $q = q_*$ when $N \geq 3$.

(ii) If equation (1.13) admits a large solution, then
\[ \int_0^1 \frac{\text{Cap}_{2,1,q'}(O^c \cap Q_{\rho}(x, t))}{\rho^N} \rho \, d\rho = \infty, \tag{1.15} \]
for any $(x, t) \in \partial_p O$, where $Q_{\rho}(x, t) = B_\rho(x) \times (t - \rho^2, t)$.

It is an open problem to prove that the maximal solution is unique whenever it exists as it holds in the elliptic case for equation (1.7), see Remark p. 25.

**Theorem 1.2** Let $N \geq 2$. The equation
\[ \partial_t u - \Delta u + e^u - 1 = 0 \text{ in } O \tag{1.16} \]
admits a large solution if there holds
\[ \int_0^1 \frac{\mathcal{P}H^N_1(O^c \cap (B_{\frac{\rho}{2}}(x) \times (t - 30\rho^2, t - \rho^2)))}{\rho^N} \rho \, d\rho = \infty, \tag{1.17} \]
for any $(x, t) \in \partial_p O$. 

4
From properties of the $W^{2,1}_q$-capacity, relation (1.14) is satisfied if the following relations hold in which $\| \|$ denotes the Lebesgue measure in $\mathbb{R}^{N+1}$,

$$
\int_0^1 \frac{|O^c \cap \{B_{\frac{30\rho}{2}}(x) \times (t - 30\rho^2, t - \rho^2)\}|^{\frac{2N}{N-2}}}{\rho^N} \, d\rho = \infty \quad \text{when } q > q_*,
$$

and

$$
\int_0^1 \left( \frac{\log_+ |O^c \cap \{B_{\frac{30\rho}{2}}(x) \times (t - 30\rho^2, t - \rho^2)\}|^{\frac{N}{N-2}}}{\rho^N} \right)^{-\frac{N}{N-2}} \, d\rho = \infty \quad \text{when } q = q_.*
$$

Similarly, it follows from properties of the $PH_1^N$-capacity that identity (1.17) is verified if

$$
\int_0^1 \frac{|O^c \cap \{B_{\frac{30\rho}{2}}(x) \times (t - 30\rho^2, t - \rho^2)\}|^{\frac{N}{N-2}}}{\rho^N} \, d\rho = \infty.
$$

When $O = \{(x, t) \in \mathbb{R}^{N+1} : |x|^2 + \frac{|t|^2}{q} < 1\}$ for some $\lambda > 0$, we see that $\partial O = \partial B_{\rho}O$. Therefore (1.15) holds for any $(x, t) \in \partial B_{\rho}O$, and (1.14)-(1.17) hold for any $(x, t) \in \partial B_{\rho}O \setminus \{(0, \sqrt{\lambda})\}$.

However, (1.14) and (1.17) are also valid at $(x, t) = (0, \sqrt{\lambda})$ if $\lambda > 1800^2$, but not valid if $\lambda < 1800^2$.

As a consequence of Theorem 1.1 we derive a sufficient condition for the existence of a large solution of a class of viscous parabolic Hamilton-Jacobi equations.

**Theorem 1.3** Let $q_1 > 1$. If there exists a large solution $v \in C^{2,1}(O)$ of

$$
\partial_t v - \Delta v + v^{q_1} = 0 \quad \text{in } O,
$$

then, for any $a, b > 0$, $1 < q < q_1$ and $1 < p < \frac{2q}{q_1+1}$, the problem

$$
\partial_t u - \Delta u + a|\nabla u|^p + bu^q = 0 \quad \text{in } O,
$$

$$
\quad u = \infty \quad \text{on } \partial B_{\rho}O,
$$

(1.18)

admits a solution $u \in C^{2,1}(O)$ which satisfies

$$
u(x, t) \geq C \min \left\{ a^{-1} \frac{1}{R} R^{-\frac{2-2q}{q(1+q_1)^2}}, b^{-1} \frac{1}{R} R^{\frac{q}{q(1+q_1)^2}}, \frac{2(p-1)}{(q_1-1)(2-p)}, \frac{q-1}{2q_1-1} \right\} (v(x, t))^{\frac{1}{q_1}},
$$

for all $(x, t) \in O$ where $R > 0$ is such that $O \subset \tilde{Q}_R(x_0, t_0)$, $C = C(N, p, q, q_1) > 0$ and $a = \max \left\{ \frac{2(p-1)}{(q_1-1)(2-p)}, \frac{q-1}{2q_1-1} \right\} \in (0, 1)$.

**2 Preliminaries**

Throughout the paper, we denote

$$
Q_{\rho}(x, t) = B_{\rho}(x) \times (t - \rho^2, t],
$$

and

$$
\tilde{Q}_{\rho}(x, t) = B_{\rho}(x) \times (t - \rho^2, t + \rho^2),
$$

for $(x, t) \in \mathbb{R}^{N+1}$ and $\rho > 0$, and $r_k = 4^{-k}$ for all $k \in \mathbb{Z}$. We also denote $A \lesssim (\gtrsim) B$ if $A \leq (\geq) CB$ for some $C$ depending on some structural constants, $A \asymp B$ if $A \lesssim B \lesssim A$. 

5
**Definition 2.1** Let $R \in (0, \infty]$ and $\mu \in \mathfrak{M}^{+}(\mathbb{R}^{N+1})$. We define $R$-truncated Riesz parabolic potential $\mathbb{I}^{R}_{2}[\mu]$ of $\mu$ by

$$
\mathbb{I}^{R}_{2}[\mu](x,t) = \int_{0}^{R} \frac{\mu(\mathcal{Q}\rho(x,t))}{\rho^{N}} \, d\rho \quad \text{for all } (x,t) \in \mathbb{R}^{N+1},
$$

and the $R$-truncated fractional maximal parabolic potential $\mathbb{M}^{R}_{2}$ of $\mu$ by

$$
\mathbb{M}^{R}_{2}[\mu](x,t) = \sup_{0<\rho<R} \frac{\mu(\mathcal{Q}\rho(x,t))}{\rho^{N}} \quad \text{for all } (x,t) \in \mathbb{R}^{N+1}.
$$

We also set $\mathbb{I}^{\infty}_{2} = \mathbb{I}_{2}$ and $\mathbb{M}^{\infty}_{2} = \mathbb{M}_{2}$. We recall two results in [21].

**Theorem 2.2** Let $q > 1, R > 0$ and $K$ be a compact set in $\mathbb{R}^{N+1}$. There exists $\mu := \mu_{K} \in \mathfrak{M}^{+}(\mathbb{R}^{N+1})$ with compact support in $K$ such that

$$
\mu(K) \leq \text{Cap}_{2,1,q'}(K) \leq \int_{\mathbb{R}^{N+1}} (\mathbb{I}^{2R}_{2}[\mu])^{q} \, dxdt
$$

where the constants of equivalence depend on $N, q$ and $R$. The measure $\mu_{K}$ is called the capacitary measure of $K$.

**Theorem 2.3** For any $R > 0$, there exist positive constants $C_{1}, C_{2}$ such that for any $\mu \in \mathfrak{M}^{+}(\mathbb{R}^{N+1})$ such that $||\mathbb{M}^{R}_{2}[\mu]||_{L^{\infty}(\mathbb{R}^{N+1})} \leq 1$, there holds

$$
\frac{1}{|Q|} \int_{Q} \exp(C_{1} \mathbb{I}^{2}[\mu]) \, dxdt := \int_{Q} \exp(C_{1} \mathbb{I}^{2}[\mu]) \, dxdt \leq C_{2},
$$

for all $Q = (Q_{r}, y, s) \subset \mathbb{R}^{N+1}$, $r > 0$, where $\chi_{Q}$ is the indicator function of $Q$.

Frostman’s Lemma in [22, Th. 3.4.27] is at the core of the dual definition of Hausdorff capacities with doubling weight. It is easy to see that it is valid for the parabolic Hausdorff $\mathcal{P}H^{N}_{\rho}$-capacity version. As a consequence we have

**Theorem 2.4** There holds

$$
\sup \{\mu(K) : \mu \in \mathfrak{M}^{+}(\mathbb{R}^{N+1}), \text{supp}(\mu) \subset K, ||\mathbb{M}^{0}_{2}[\mu]||_{L^{\infty}(\mathbb{R}^{N+1})} \leq 1\} \approx \mathcal{P}H^{N}_{\rho}(K),
$$

for any compact set $K \subset \mathbb{R}^{N+1}$ and $\rho > 0$, where equivalent constant depends on $N$.

For our purpose, we need the some results about the behavior of the capacity with respect to dilations.

**Proposition 2.5** Let $K \subset \overline{Q_{100}(0,0)}$ be a compact set and $1 < p < \frac{N+2}{2}$. Then

$$
\text{Cap}_{2,1,p}(K) \gtrsim |K|^{1 - \frac{2p}{N+2}} \quad \text{and} \quad \text{Cap}_{2,1,\frac{N+2}{2}}(K) \gtrsim \left( \log \left( \frac{|\mathcal{Q}_{200}(0,0)|}{|K|} \right) \right)^{-\frac{2}{N}}. \quad (2.1)
$$

Furthermore

$$
\text{Cap}_{2,1,p}(K_{\rho}) \gtrsim \rho^{N+2-2p} \text{Cap}_{2,1,p}(K), \quad (2.2)
$$

$$
\frac{1}{\text{Cap}_{2,1,\frac{N+2}{2}}(K_{\rho})} \leq \frac{1}{\text{Cap}_{2,1,\frac{N+2}{2}}(K)} + (\log(2/\rho))^{N/2}, \quad (2.3)
$$

for any $0 < \rho < 1$, where $K_{\rho} = \{(\rho x, \rho^{2}t) : (x,t) \in K\}$. 

Proposition 2.6 Let $K \subset \overline{Q_1(0,0)}$ be a compact set and $1 < p \leq \frac{N+2}{2}$. Then, there exists a function $\varphi \in C_c^{\infty}(\overline{Q_3/2}(0,0))$ with $0 \leq \varphi \leq 1$ and $\varphi|_D = 1$ for some open set $D \supset K$ such that

$$\int_{\mathbb{R}^{N+1}} (|D^2 \varphi|^p + |\nabla \varphi|^p + |\varphi|^p + |\partial_t \varphi|^p) \, dx dt \lesssim \text{Cap}_{2,1,p}(K).$$

(2.4)

We will give proofs of the above two propositions in the Appendix.

Theorem 2.7

Let $\{e^{t\Delta}\}_{t \geq 0}$ be the semigroup of contractions in $L^p$ ($1 \leq p < \infty$) generated by $\Delta$. It is well-known that the solution $u$ of the problem

$$\begin{align*}
\partial_t u - \Delta u &= \mu & \text{in } \tilde{Q}_R(0,0), \\
u &= 0 & \text{on } \partial_0 \tilde{Q}_R(0,0),
\end{align*}$$

(2.5)

with $\mu \in C^\infty(\tilde{Q}_R(0,0))$, can be expressed by Duhamel’s formula

$$u(x, t) = \int_0^t \left( e^{(t-s)\Delta} \mu \right)(x, s) ds \text{ for all } (x, t) \in \tilde{Q}_R(0,0).$$

We denote by $H$ the Gaussian kernel in $\mathbb{R}^{N+1}$:

$$H(x, t) = \frac{1}{(4\pi t)^{\frac{N}{2}}} e^{-\frac{|x|^2}{4t}} \chi_{t>0}.$$  

We have

$$|u(x, t)| \leq (H * \mu)(x, t) \text{ for all } (x, t) \in \tilde{Q}_R(0,0).$$

In [21, Proof of Proposition 4.8] we show that

$$|(H * \mu)(x, t) \leq C_1(N) \mu^2_{2R} ||\mu||(x, t) \text{ for all } (x, t) \in \tilde{Q}_R(0,0).$$

Here $\mu$ is extended by 0 in $(\tilde{Q}_R(0,0))^c$. Thus,

$$| \int_0^t \left( e^{(t-s)\Delta} \mu \right)(x, s) ds | \leq C_1(N) \mu^2_{2R} ||\mu||(x, t) \text{ for all } (x, t) \in \tilde{Q}_R(0,0).$$

(2.6)

Moreover, we also prove in [21], that if $\mu \geq 0$ then for $(x, t) \in \tilde{Q}_R(0,0)$ and $B_\rho(x) \subset B_0(0)$,

$$\int_0^t \left( e^{(t-s)\Delta} \mu \right)(x, s) ds \geq C_2(N) \sum_{k=0}^\infty \frac{\mu(Q_\rho(x, t - \frac{35}{12R^2\rho_k^2}))}{\rho_k^{N+2}},$$

(2.7)

with $\rho_k = 4^{-k} \rho$.  

It is easy to see that estimates (2.6) and (2.7) also holds for any bounded Radon measure $\mu$ in $\tilde{Q}_R(0,0)$. The following result is proved in [3] and [19], and also in [21] in a more general framework.

Theorem 2.7 Let $q > 1, R > 0$ and $\mu$ be a bounded Radon measure in $\tilde{Q}_R(0,0)$.

(i) If $\mu$ is absolutely continuous with respect to $\text{Cap}_{2,1,q'}$ in $\tilde{Q}_R(0,0)$, then there exists a unique weak solution $u$ to equation

$$\begin{align*}
\partial_t u - \Delta u + |u|^{q-1} u &= \mu & \text{in } \tilde{Q}_R(0,0), \\
u &= 0 & \text{on } \partial_0 \tilde{Q}_R(0,0).
\end{align*}$$

(ii) If $\exp(C_1(N) \mu^2_{2R} ||\mu||) \in L^1(\tilde{Q}_R(0,0))$, then there exists a unique weak solution $v$ to equation

$$\begin{align*}
\partial_t v - \Delta v + \text{sign}(v)(|v| - 1) &= \mu & \text{in } \tilde{Q}_R(0,0), \\
v &= 0 & \text{on } \partial_0 \tilde{Q}_R(0,0),
\end{align*}$$

where the constant $C_1(N)$ is the one of inequality (2.6).
From estimates (2.6) and (2.7) and using comparison principle we get the estimates from below of the solutions \( u \) and \( v \) obtained in Theorem 2.7.

**Proposition 2.8** If \( \mu \) is nonnegative, then the functions \( u \) and \( v \) of the previous theorem are nonnegative too and satisfy

\[
u(x,t) \geq C_2(N) \sum_{k=0}^{\infty} \frac{\mu(Q_{\rho_k}(x,t - \frac{4k^2}{48} \rho_k^2))}{\rho_k^2} - C_1(N)^{q+1} 2^R \left[ \|2^R V[\mu]\| \right] (x,t), \tag{2.8}\]

and

\[
v(x,t) \geq C_2(N) \sum_{k=0}^{\infty} \frac{\mu(Q_{\rho_k}(x,t - \frac{4k^2}{48} \rho_k^2))}{\rho_k^2} - C_1(N) 2^R [\exp(C_1(N) 2^R |\mu|) - 1] (x,t), \tag{2.9}\]

for any \((x,t) \in \tilde{Q}_R(0,0)\) and \( B_\rho(x) \subset B_R(0) \) and \( \rho_k = 4^{-k} \rho \).

### 3 Maximal solutions

In this section we assume that \( O \) is an arbitrary non-cylindrical and bounded open set in \( \mathbb{R}^{N+1} \) and \( q > 1 \). We will prove the existence of a maximal solution of

\[
\partial_t u - \Delta u + u^q = 0 \tag{3.1}
\]

in \( O \). We also get an analogous result when \( u^q \) is replaced by \( e^u - 1 \).

It is easy to see that if \( u \) satisfies (3.1) in \( \tilde{Q}_R(0,0) \) (\( Q_r(0,0) \)) then \( u(a,x,t) = a^{-2/(q-1)} u(ax,a^2t) \) satisfies (3.1) in \( \tilde{Q}_{r/s}(0,0) \) (\( Q_{r/s}(0,0) \)) for any \( a > 0 \). If \( X = (x,t) \in O \), the parabolic distance from \( X \) to the parabolic boundary \( \partial_p O \) of \( O \) is defined by

\[
d(X,\partial_p O) = \inf_{y,s \in \partial_p O} \max\{|x-y|, (t-s)^{1/q}\}.
\]

It is easy to see that there exists \( C = C(N,q) > 0 \) such that the function \( V \) defined by

\[
V(x,t) = C \left( \left( \rho^2 + t\right)^{-\frac{1}{q-1}} + \left( \frac{\rho^2 - |x|^2}{\rho} \right)^{-\frac{2}{q-1}} \right) \quad \text{in} \quad B_\rho(0) \times (-\rho^2,0),
\]

satisfies

\[
\partial_t V - \Delta V + V^q \geq 0 \quad \text{in} \quad B_\rho(0) \times (-\rho^2,0). \tag{3.2}
\]

**Proposition 3.1** There exists a maximal solution \( u \in C^{2,1}(O) \) of (3.1) and it satisfies

\[
u(x,t) \leq C(d((x,t),\partial_p O))^{-\frac{1}{q-1}} \quad \text{for all} \quad (x,t) \in O, \tag{3.3}\]

for some \( C = C(N,q) \).

**Proof.** Let \( D_k \), \( k \in \mathbb{Z} \) be the collection of all the dyadic parabolic cubes (abridged \( p \)-cubes) of the form

\[
\{ (x_1,...,x_N,t) : \text{such that} \}.
\]

where \( m_j \in \mathbb{Z} \). The following properties hold,

a. for each integer \( k \), \( D_k \) is a partition of \( \mathbb{R}^{N+1} \) and all \( p \)-cubes in \( D_k \) have the same sidelengths.
b. if the interiors of two $p$-cubes $Q$ in $D_{k_1}$ and $P$ in $D_{k_2}$, denoted $\overset{\circ}{Q}, \overset{\circ}{P}$, have nonempty intersection then either $Q$ is contained in $P$ or $Q$ contains $P$.

c. Each $Q$ in $D_k$ is union of $2^{N+2}$ $p$-cubes in $D_{k+1}$ with disjoint interiors.

Let $k_0 \in \mathbb{N}$ be such that $Q \subset O$ for some $Q \in D_{k_0}$. Set $O_k = \bigcup_{Q \subset O} Q$, $\forall k \geq k_0$, we

have $O_k \subset O_{k+1}$ and $O = \bigcup_{k \geq k_0} O_k = \bigcup_{k \geq k_0} \overset{\circ}{O}_k$. More precisely, there exist real numbers $a_1, a_2, \ldots, a_{n(k)}$ and open sets $\Omega_1, \Omega_2, \ldots, \Omega_{n(k)}$ in $\mathbb{R}^N$ such that

$$a_i < a_i + 4^{-k} \leq a_{i+1} < a_{i+1} + 4^k$$

for $i = 1, \ldots, n(k) - 1$ and

$$\overset{\circ}{O}_k = \bigcup_{i=1}^{n(k)-1} (\Omega_i \times (a_i, a_i + 4^{-k})) \bigcup (\Omega_{n(k)} \times (a_{n(k)}, a_{n(k)} + 4^{-k})).$$

For $k \geq k_0$, we claim that there exists a solution $u_k \in C^{2,1}(\overset{\circ}{O}_k)$ to problem

\begin{equation}
\begin{aligned}
\partial_t u_k - \Delta u_k + u_k^q &= 0 &\text{in}\; \overset{\circ}{O}_k, \\
u_k(x, t) \to &\infty &\text{as} d((x, t), \partial_p \overset{\circ}{O}_k) \to 0.
\end{aligned}
\end{equation}

Indeed, by [6, 15] for $m > 0$, one can find nonnegative solutions $v_i \in C^{2,1}(\Omega_i \times (a_i, a_i + 4^{-k})) \cap C(\overline{\Omega_i} \times [a_i, a_i + 4^{-k}])$ for $i = 1, \ldots, n(k)$ to equations

$$\begin{aligned}
\partial_t v_i - \Delta v_i + v_i^q &= 0 &\text{in}\; \Omega_i \times (a_i, a_i + 4^{-k}), \\
v_i(x, t) &= m &\text{on}\; \partial \Omega_i \times (a_i, a_i + 4^{-k}), \\
v_i(x, a_i) &= m_i &\text{in}\; \Omega_i,
\end{aligned}$$

and

$$\begin{aligned}
\partial_t v_i - \Delta v_i + v_i^q &= 0 &\text{in}\; \Omega_i \times (a_i, a_i + 4^{-k}), \\
v_i(x, t) &= m &\text{on}\; \partial \Omega_i \times (a_i, a_i + 4^{-k}), \\
v_i(x, a_i) &= m_i &\text{in}\; \Omega_i,
\end{aligned}$$

where

$$m_i = \begin{cases} 
m &\text{in}\; \Omega_i \\
m \chi_{\Omega_i \setminus \Omega_{i-1}}(x) + v_{i-1}(x, a_{i-1} + 4^{-k}) \chi_{\Omega_{i-1}}(x) &\text{if}\; a_i > a_{i-1} + 4^{-k}, \\
\text{otherwise}.
\end{cases}$$

Clearly,

$$u_{k,m} = v_i \text{ in } \Omega_i \times (a_i, a_i + 4^{-k})$$

for $i = 1, \ldots, n(k)$

is a solution in $C^{2,1}(\overset{\circ}{O}_k) \cap C(O_k)$ to equation

$$\begin{aligned}
\partial_t u_{k,m} - \Delta u_{k,m} + u_{k,m}^q &= 0 &\text{in}\; \overset{\circ}{O}_k, \\
u_{k,m} &= m &\text{on}\; \partial_p \overset{\circ}{O}_k.
\end{aligned}$$

Moreover, for $(x, t) \in \overset{\circ}{O}_k$, we see that $B_{\frac{d}{4}}(x) \times (t - \frac{d}{4}, t) \subset \overset{\circ}{O}_k$ where $d = d((x, t), \partial_p \overset{\circ}{O}_k)$. From (3.2), we verify that

$$U(y, s) := V(y - x, s - t) = C \left( \frac{\rho^2 + s - t}{\sqrt{\rho}} + \left( \frac{\rho^2 - |x - y|^2}{\rho} \right)^{-\frac{\rho}{2}} \right)$$
Indeed, assume that admits also a large solution.

**Remark 3.3** If the equation \( Q \) and \( K \) satisfy

\[
\text{Applying the comparison principle we get }
\]

\[
u_{k,m}(y,s) \leq U(y,s) \text{ in } B_{\frac{r}{2}}(x) \times (t - \frac{d^2}{4}, t],
\]

which implies

\[
u_{k,m}(x,t) \leq C \left( d((x,t), \partial_p \tilde{O}_k) \right)^{-\frac{n}{2-r}} \text{ for all } (x,t) \in \tilde{O}_k.
\]

From this, we obtain also uniform local bounds for \( \{u_{k,m}\}_m \). By standard regularity theory see, \([6, 15]\), \( \{u_{k,m}\}_m \) is uniformly locally bounded in \( C^{2,1} \). Hence, up to a subsequence, \( u_{k,m} \to u_k \) in \( C^{1,0}_{\text{loc}}(\tilde{O}_k) \) as \( m \to \infty \). We derive that \( u_k \) is a weak solution of (3.4) in \( \tilde{O}_k \), which satisfies \( u_k(x,t) \to \infty \) as \( d((x,t), \partial_p \tilde{O}_k) \to 0 \) and

\[
u_k(x,t) \leq C \left( d((x,t), \partial_p \tilde{O}_k) \right)^{-\frac{n}{2-r}} \text{ for all } (x,t) \in \tilde{O}_k.
\]

Let \( m > 0 \) and \( k \geq k_0 \). Since \( u_{k+1,m} \leq m \) in \( O_k \) and \( O_k \subset O_{k+1} \), it follows by the comparison principle applied to \( u_{k+1,m} \) and \( u_{k,m} \) in the following \( n(k) \) sub-domains of \( \tilde{O}_k \):

\[
\Omega_1 \times (a_1, a_1 + 4^{-k}), \Omega_2 \times (a_2, a_2 + 4^{-k}), \ldots, \Omega_{n(k)} \times (a_{n(k)}, a_{n(k)} + 4^{-k}),
\]

that \( u_{k+1,m} \leq u_{k,m} \) in \( \tilde{O}_k \), and thus \( u_{k+1} \leq u_k \) in \( \tilde{O}_k \) by letting \( m \to \infty \). In particular, \( \{u_k\}_k \) is uniformly locally bounded in \( L^\infty_{\text{loc}} \). We use the same compactness property as above to infer that \( u_k \to u \) as \( k \to \infty \). Then \( u \) is a solution of (3.1) and it satisfies (3.3). By construction \( u \) is the maximal solution.

**Remark 3.2** Let \( R \geq 2r \geq 2 \), \( K \) be a compact subset in \( \overline{Q}_r(0,0) \). As in the proof of Proposition 3.1, we can show that there exists a maximal solution of

\[
\partial_t u - \Delta u + u^q = 0 \quad \text{in } \overline{Q}_R(0,0) \setminus K,
\]

which satisfies

\[
u(x,t) \leq C(d((x,t), \partial_p \overline{Q}_R(0,0) \setminus K))^{-\frac{n}{2-r}} \quad \forall (x,t) \in \overline{Q}_R(0,0) \setminus K,
\]

for some \( C = C(N, q) \). Furthermore, assume \( K_1, K_2, \ldots, K_m \) are compact subsets in \( Q_r(0,0) \) and \( K = K_1 \cup \ldots \cup K_m \). Let \( u, u_1, \ldots, u_m \) be the maximal solutions of (3.7) in \( Q_R(0,0) \setminus K_1, Q_R(0,0) \setminus K_2, \ldots, Q_R(0,0) \setminus K_m \), respectively, then

\[
u \leq \sum_{j=1}^m u_j \quad \text{in } Q_R(0,0) \setminus K.
\]

**Remark 3.3** If the equation (3.1) admits a large solution for some \( q > 1 \), then for any \( 1 < q_1 < q \), the equation

\[
\partial_t u - \Delta u + u^{q_1} = 0 \quad \text{in } O
\]

admits also a large solution.

Indeed, assume that \( u \) is a large solution of (3.1) and \( v \) the maximal solution of (3.10). Take \( R > 0 \) such that \( O \subset B_R(0) \times (-R^2, R^2) \), then the function \( V \) defined by

\[
V(x,t) = (q - 1)^{-\frac{n}{2-r}}(2R^2 + t)^{-\frac{n}{2-r}},
\]

with \( \rho = d/2 \), satisfies

\[
\partial_t U - \Delta U + U^q \geq 0 \quad \text{in } B_{\frac{r}{2}}(x) \times (t - \frac{d^2}{4}, t].
\]
satisfies (3.1). It follows for all \((x, t) \in O\)
\[
    u(x, t) \geq \inf_{(y, s) \in \Omega} V(x, t) \geq (q - 1)^{\frac{\nu}{\nu - q_1}} R^{\frac{\nu - q_1}{\nu - q_1}} =: a_0.
\]
Then \(\tilde{u} = a_0^{\frac{q - q_1}{q_1 - q}} u\) is a subsolution of (3.10). Therefore \(v \geq a_0^{\frac{q - q_1}{q_1 - q}} u\) in \(O\), thus \(v\) is a large solution.

**Remark 3.4 (Sub-critical case)** Assume that \(1 < q < q_*\). It is easy to check that the function
\[
    U(x, t) = C \frac{1}{(t - s)^{\frac{\nu}{\nu - q_1}}} e^{-\frac{|x - s|^2}{4(t - s)}} \chi_{t > 0}
\]
is a subsolution of (3.1) in \(\mathbb{R}^{n+1} \setminus \{(0, 0)\}\), where \(C = \left(\frac{2}{q - q_1} - \frac{2}{2} \right)^{\frac{1}{q_1 - q}}\).

Therefore, the maximal solution \(u\) of (3.1) in \(O\) verifies
\[
    u(x, t) \geq C \frac{1}{(t - s)^{\frac{\nu}{\nu - q_1}}} e^{-\frac{|x - s|^2}{4(t - s)}} \chi_{t > s}, \tag{3.12}
\]
for all \((x, t) \in O\) and \((y, s) \in O^c\).

If for any \((x, t) \in \partial O\) there exists \(\varepsilon \in (0, 1)\) and a decreasing sequence \(\{\delta_n\} \subset (0, 1)\) converging to 0 as \(n \to \infty\) such that \((B_{\delta_n}(x) \times (-\delta_n^2 + t, -\varepsilon \delta_n^2 + t)) \cap O^c \neq \emptyset\) for any \(n \in \mathbb{N}\), then \(u\) is a large solution. For proving this, we need to show that
\[
    \lim_{\rho \to 0} \inf_{\partial \Omega \cap (B_{\rho}(x) \times (-\rho^2 + t, \rho^2 + t))} u = \infty.
\]
Let \(0 < \rho < \sqrt{2} \delta_1\) and \(n \in \mathbb{N}\) such that \(\sqrt{2} \delta_{n+1} \leq \rho < \sqrt{2} \delta_n\).

Since \((B_{\delta_n}(x) \times (-\delta_n^2 + t, -\varepsilon \delta_n^2 + t)) \cap O^c \neq \emptyset\), there is \((x_n, t_n) \in O^c\) such that \(|x_n - x| < \delta_n\) and \(-\delta_n^2 + t < t_n < -\varepsilon \delta_n^2 + t\). So if \((y, s) \in O \cap (B_{\rho}(x) \times (-\rho^2 + t, \rho^2 + t))\) then \(|y - x_n| < (\sqrt{2} + 1) \delta_n\) and \(\frac{\varepsilon}{\rho^2} \delta_n^2 < s - t_n < (\varepsilon + 1) \delta_n^2\). Hence, thanks to (3.12) we have for any \((y, s) \in O \cap (B_{\rho}(x) \times (-\rho^2 + t, \rho^2 + t))\)
\[
    u(y, s) \geq C \frac{1}{(s - t_n)^{\frac{\nu}{\nu - q_1}}} e^{-\frac{|y - s|^2}{4(s - t_n)}} \geq C(\varepsilon + 1)^{-\frac{\nu}{\nu - q_1}} e^{-\frac{(|y - s|^2)}{4(s - t_n)}} \delta_n^{-\frac{2}{q_1 - q}},
\]
which implies
\[
    \inf_{\partial \Omega \cap (B_{\rho}(x) \times (-\rho^2 + t, \rho^2 + t))} u \geq C(\varepsilon + 1)^{-\frac{\nu}{\nu - q_1}} e^{-\frac{(|y - s|^2)}{4(s - t_n)}} \delta_n^{-\frac{2}{q_1 - q}} \to \infty \text{ as } \rho \to 0.
\]

**Remark 3.5** Note that if \(u \in C^{2,1}(O)\) is a solution of (3.1) for some \(q > 1\) then, for \(a, b > 0\) and \(1 < p \leq 2\), the function \(v = b^{-\frac{1}{p - 1}} u\) is a super-solution of
\[
    \partial_\nu v - \Delta v + a|\nabla v|^p + bv^q = 0 \quad \text{in } O. \tag{3.13}
\]

Thus, we can apply the argument of the previous proof, with equation (3.1) replaced by (3.13), and deduce that there exists a maximal solution \(v \in C^{2,1}(O)\) of (3.13) satisfying
\[
    v(x, t) \leq C b^{-\frac{1}{p - 1}} (d((x, t), \partial_\nu O))^{-\frac{q}{q_1 - q}} \quad \text{for all } (x, t) \in O.
\]
Furthermore, if \(1 < q < q_*\), \(q = \frac{2p}{p + 1}\), \(a, b > 0\) then the function \(U\) expressed by (3.11) in Remark 3.4 is a subsolution of (3.13) in \(\mathbb{R}^{n+1} \setminus \{(0, 0)\}\), provided the explicit constant \(C\)
given therein is replaced by some $C = C(N, p, q, a, b)$. Therefore, we conclude that every maximal solution of $v \in C^{2,1}(O)$ of (3.13) satisfy

$$v(x, t) \geq \frac{1}{(t-s)^{\frac{N}{2}} + e^{2(t-s)}} |x|^{\frac{N}{2}} x \geq s$$

for all $(x, t) \in O$ and $(y, s) \in \partial_p O$.

Arguing as in Remark 3.4, if for any $(x, t) \in \partial_p O$ there exist $\varepsilon \in (0, 1)$ and a decreasing sequence $\{\delta_n\} \subset (0, 1)$ converging to $0$ as $n \to \infty$ such that $(B_{\delta_n}(x) \times (-\delta_n^2 + t, -\varepsilon \delta_n^2 + t)) \cap O^c \neq \emptyset$ for any $n \in \mathbb{N}$, then $v$ is a large solution.

Next, we consider the following equation

$$\partial_t u - \Delta u + e^u - 1 = 0.$$

It is easy to see that the two functions

$$V_1(t) = -\log \left( \frac{t + \rho^2}{1 + \rho^2} \right) \quad \text{and} \quad V_2(x) = C - 2 \log \left( \frac{\rho^2 - |x|^2}{\rho} \right)$$

satisfy

$$V_1' + e^{V_1} - 1 \geq 0 \quad \text{in} \quad (-\rho^2, 0],$$

and

$$-\Delta V_2 + e^{V_2} - 1 \geq 0 \quad \text{in} \quad B_\rho(0),$$

for some $C = C(N)$. Using $e^a + e^b \leq e^{a+b} - 1$ for $a, b \geq 0$, we obtain that $V_1 + V_2$ is a supersolution of equation (3.15) in $B_\rho(0) \times (-\rho^2, 0]$. By the same argument as in Proposition 3.1 and the estimate of the above supersolution, we infer the following:

**Proposition 3.6** There exists a maximal solution $u \in C^{2,1}(O)$ of

$$\partial_t u - \Delta u + e^u - 1 = 0 \quad \text{in} \quad O,$$

and it satisfies

$$u(x, t) \leq C - \log \left( \frac{(d((x, t), \partial_p O))^3}{1 + (d((x, t), \partial_p O))^2} \right) \quad \text{for all} \quad (x, t) \in O,$$

for some $C = C(N)$.

The next three propositions will be useful to prove Theorem 1.1-(ii).

**Proposition 3.7** Let $K \subset Q_1(0, 0)$ be a compact set and $q > 1$, $R \geq 100$. Let $u$ be a solution of (3.7) in $\tilde{Q}_1(0, 0) \setminus K$ and $\varphi$ as in Proposition 2.6 with $p = q'$. Set $\xi = (1 - \varphi)^{2q'}$. Then,

$$\int_{Q_1(0, 0)} u(|\Delta \xi| + |\nabla \xi| + |\partial_t \xi|) dx dt \lesssim \text{Cap}_{2,1,q'}(K),$$

$$u(x, t) \lesssim \text{Cap}_{2,1,q'}(K) + R^{-\frac{2}{q'}} \quad \text{for any} \quad (x, t) \in \tilde{Q}_1(0, 0) \setminus K,$$

and

$$\int_{\tilde{Q}_2(0, 0)} u \xi dx dt \lesssim \text{Cap}_{2,1,q'}(K) + R^{-\frac{2}{q'}},$$

where the constants in above inequalities depend only on $N$ and $q$. 

12
Proof. Step 1. We claim that
\begin{equation}
\int_{Q_n(0,0)} u^q \xi dxdt \lesssim \text{Cap}_{2,1,q'}(K). \tag{3.21}
\end{equation}
Actually, using integration by parts and the Green formula, one has
\begin{align*}
\int_{Q_n(0,0)} u^q \xi dxdt &= -\int_{\partial \Omega} \partial u \xi d\nu + \int_{\Omega} \Delta u dxdt \\
&\quad + \int_{Q_n(0,0)} u_\nu \xi dxdt + \int_{\Omega} u \xi dxdt + \int_{\Omega} u \Delta \xi dxdt + \int_{-R^2} \int_{\partial B_R(0)} \left( \frac{\partial u}{\partial \nu} - u \frac{\partial \xi}{\partial \nu} \right) dSdt,
\end{align*}
where \( \nu \) is the outer normal unit vector on \( \partial B_R(0) \). Clearly,
\[ \frac{\partial u}{\partial \nu} \leq 0 \quad \text{and} \quad \frac{\partial \xi}{\partial \nu} = 0 \quad \text{on} \quad \partial B_R(0). \]
Thus,
\begin{align*}
\int_{Q_n(0,0)} u^q \xi dxdt &\leq \int_{Q_n(0,0)} u |\partial_\tau \xi| dxdt + \int_{Q_n(0,0)} u |\Delta \xi| dxdt \\
&\leq 2q' \int_{Q_n(0,0)} u (1 - \varphi)^{2q'-1} |\partial_\tau \varphi| dxdt + 2q' \int_{Q_n(0,0)} u (1 - \varphi)^{2q'-2} |\nabla \varphi|^2 dxdt \\
&\quad + 2q' \int_{Q_n(0,0)} u (1 - \varphi)^{2q'-1} |\Delta \varphi| dxdt \\
&\leq 2q' \int_{Q_n(0,0)} u \xi^{1/q} |\partial_\tau \varphi| dxdt + 2q' \int_{Q_n(0,0)} u \xi^{1/q} |\nabla \varphi|^2 dxdt \\
&\quad + 2q' \int_{Q_n(0,0)} u \xi^{1/q} |\Delta \varphi| dxdt. \tag{3.22}
\end{align*}
In the last inequality, we have used the fact that \( (1 - \varphi)^{2q'-1} \leq (1 - \varphi)^{2q'-2} = \xi^{1/q} \).
Hence, by Hölder’s inequality,
\begin{align*}
\int_{Q_n(0,0)} u^q \xi dxdt &\leq \int_{Q_n(0,0)} |\partial_\tau \varphi|^q dxdt + \int_{Q_n(0,0)} |\nabla \varphi|^{2q'} dxdt \\
&\quad + \int_{Q_n(0,0)} |\Delta \varphi|^q dxdt.
\end{align*}
By the Gagliardo-Nirenberg inequality,
\begin{align*}
\int_{Q_n(0,0)} |\nabla \varphi|^{2q'} dxdt &\lesssim \|\varphi\|_{L^q(Q_n(0,0))} \int_{Q_n(0,0)} |D^2 \varphi|^q dxdt \\
&\lesssim \int_{Q_n(0,0)} |D^2 \varphi|^q dxdt.
\end{align*}
Hence, we find
\begin{align*}
\int_{Q_n(0,0)} u^q \xi dxdt &\lesssim \int_{Q_n(0,0)} (|\partial_\tau \varphi|^q + |D^2 \varphi|^q) dxdt,
\end{align*}
and derive (3.21) from (2.4). In view of (3.22), we also obtain
\begin{align*}
\int_{Q_n(0,0)} u (|\Delta \xi| + |\partial_\tau \xi|) dxdt \lesssim \text{Cap}_{2,1,q'}(K),
\end{align*}
and we have proved the desired estimate.
and
\[ 
\int_{\tilde{Q}_n(0,0)} u|\nabla \xi| dx dt \lesssim \text{Cap}_{2, 1, q'}(K),
\]
since
\[ 
\int_{\tilde{Q}_n(0,0)} u|\nabla \xi| dx dt = 2q' \int_{\tilde{Q}_n(0,0)} u^{(2q'-1)/2q'} |\nabla \varphi| dx dt 
\leq 2q' \int_{\tilde{Q}_n(0,0)} u^{1/q'} |\nabla \varphi| dx dt 
\lesssim \int_{\tilde{Q}_n(0,0)} u^q dx dt + \int_{\tilde{Q}_n(0,0)} |\nabla \varphi|^q dx dt.
\]
It yields (3.18).

**Step 2.** Relation (3.19) holds. Let \( \eta \) be a cut off function on \( \tilde{Q}_{R/4}(0,0) \) with respect to \( \tilde{Q}_{R/3}(0,0) \) such that \(|\partial_1 \eta| + |D^2 \eta| \lesssim R^{-2} \) and \(|\nabla \eta| \lesssim R^{-1} \). We have
\[ 
\partial_1(\eta \xi u) - \Delta(\eta \xi u) = F \in C_c(\tilde{Q}_{R/3}(0,0)).
\]
Hence, we can write
\[ 
(\eta \xi u)(x, t) = \int_{\mathbb{R}^N} \int_{-\infty}^t \frac{1}{(4\pi(t-s))^{N/2}} e^{-\frac{|x-y|^2}{4(t-s)}} F(y, s) ds dy \forall (x, t) \in \mathbb{R}^{N+1}.
\]
Now, we fix \((x, t) \in \tilde{Q}_{R/3}(0,0) \setminus \tilde{Q}_2(0,0)\). Since \( \text{supp} \{ |\nabla \eta| \} \cap \text{supp} \{ |\nabla \xi| \} = \emptyset \) and
\[ 
F = \eta \xi (\partial_1 u - \Delta u) - 2(\eta \xi u + \xi \partial_1 \eta + \eta \partial_1 \xi - 2\eta \xi \nabla \eta - \Delta \eta \xi - \eta \Delta \xi) u 
\leq -2(\eta \nabla \xi + \xi \nabla \eta) \nabla u + (\xi \partial_1 \eta + \eta \partial_1 \xi - \xi \Delta \eta - \eta \Delta \xi) u,
\]
there holds
\[ 
u(x, t) = (\eta \xi u)(x, t) \leq -2 \int_{\mathbb{R}^N} \int_{-\infty}^t \frac{1}{(4\pi(t-s))^{N/2}} e^{-\frac{|x-y|^2}{4(t-s)}} (\eta \nabla \xi + \xi \nabla \eta) \nabla u ds dy 
+ \int_{\mathbb{R}^N} \int_{-\infty}^t \frac{1}{(4\pi(t-s))^{N/2}} e^{-\frac{|x-y|^2}{4(t-s)}} (\eta \partial_1 \xi - \eta \Delta \xi) u ds dy 
+ \int_{\mathbb{R}^N} \int_{-\infty}^t \frac{1}{(4\pi(t-s))^{N/2}} e^{-\frac{|x-y|^2}{4(t-s)}} (\partial_1 \eta \xi - \xi \Delta \eta) u ds dy. 
= I_1 + I_2 + I_3.
\]
By integration by parts,
\[ 
I_1 = 2(4\pi)^{-N/2} \int_{-\infty}^t \int_{\mathbb{R}^N} \frac{(x-y)}{2(t-s)^{(N+2)/2}} e^{-\frac{|x-y|^2}{4(t-s)}} (\eta \nabla \xi + \xi \nabla \eta) u dy ds 
+ 2(4\pi)^{-N/2} \int_{-\infty}^t \int_{\mathbb{R}^N} \frac{1}{(t-s)^{N/2}} e^{-\frac{|x-y|^2}{4(t-s)}} (\xi \Delta \eta + \eta \Delta \xi) u dy ds.
\]
Note that
\[ 
\frac{1}{(t-s)^{N/2}} e^{-\frac{|x-y|^2}{4(t-s)}} \lesssim \left( \max \{|x-y|, |t-s|^{1/2}\} \right)^{-N},
\]
\[ 
\frac{|x-y|}{2(t-s)^{(N+2)/2}} e^{-\frac{|x-y|^2}{4(t-s)}} \lesssim \left( \max \{|x-y|, |t-s|^{1/2}\} \right)^{-N-1},
\]

14
and
\[
\max\{|x-y|,|t-s|^{1/2}\} \geq 1 \quad \forall (y,s) \in \text{supp}\{|D^\alpha \xi|\} \cup \text{supp}\{|\partial_\alpha \xi|\},
\]
\[
\max\{|x-y|,|t-s|^{1/2}\} \geq R \quad \forall (y,s) \in \text{supp}\{|D^\alpha \eta|\} \cup \text{supp}\{|\partial_\alpha \eta|\}, \forall |\alpha| \geq 1.
\]
We deduce
\[
I_1 \lesssim \int_{\mathbb{R}^{N+1}} \left( \max\{|x-y|,|t-s|^{1/2}\} \right)^{-N-1} (\eta|\nabla \xi| + \xi|\nabla \eta|) u \, dyds
\]
\[
+ \int_{\mathbb{R}^{N+1}} \left( \max\{|x-y|,|t-s|^{1/2}\} \right)^{-N} (\xi|\Delta \eta| + \eta|\Delta \xi|) u \, dyds
\]
\[
\lesssim \int_{\mathbb{R}^{N+1}} (|\nabla \xi| + |\Delta \xi|) u \, dyds + \int_{\mathcal{Q}_{R/3}(0,0) \setminus \mathcal{Q}_{R/4}(0,0)} (R^{-N-1}|\nabla \eta| + R^{-N}|\Delta \eta|) u \, dyds
\]
\[
\lesssim \int_{\mathbb{R}^{N+1}} (|\nabla \xi| + |\Delta \xi|) u \, dyds + \sup_{\mathcal{Q}_{R/3}(0,0) \setminus \mathcal{Q}_{R/4}(0,0)} u,
\]
and
\[
I_2 \lesssim \int_{\mathbb{R}^{N+1}} \left( \max\{|x-y|,|t-s|^{1/2}\} \right)^{-N} (|\partial_\xi \xi| + |\Delta \xi|) u \, dyds
\]
\[
\lesssim \int_{\mathbb{R}^{N+1}} (|\partial_\xi \xi| + |\Delta \xi|) u \, dyds,
\]

and
\[
I_3 \lesssim \int_{\mathbb{R}^{N+1}} \left( \max\{|x-y|,|t-s|^{1/2}\} \right)^{-N} (|\partial_\eta \eta| + |\Delta \eta|) u \, dyds
\]
\[
\lesssim \int_{\mathcal{Q}_{R/3}(0,0) \setminus \mathcal{Q}_{R/4}(0,0)} R^{-N} (|\partial_\eta \eta| + |\Delta \eta|) u \, dyds
\]
\[
\lesssim \sup_{\mathcal{Q}_{R/3}(0,0) \setminus \mathcal{Q}_{R/4}(0,0)} u.
\]

Hence,
\[
\int_{\mathbb{R}^{N+1}} (|\theta \xi u|) \, dx dt \lesssim \int_{\mathbb{R}^{N+1}} \left( \max\{|x-y|,|t-s|^{1/2}\} \right)^{-N-1} (\theta|\nabla \xi| + \xi|\nabla \theta|) u \, dyds
\]
\[
+ \int_{\mathbb{R}^{N+1}} \left( \max\{|x-y|,|t-s|^{1/2}\} \right)^{-N} (\theta|\Delta \xi| + \xi|\Delta \theta|) u \, dyds
\]
\[
+ \int_{\mathbb{R}^{N+1}} \left( \max\{|x-y|,|t-s|^{1/2}\} \right)^{-N} (\theta|\partial_\xi \xi| + \theta|\Delta \xi|) u \, dyds
\]
\[
+ \int_{\mathbb{R}^{N+1}} \left( \max\{|x-y|,|t-s|^{1/2}\} \right)^{-N} (\xi|\partial_\theta \theta| + \xi|\Delta \theta|) u \, dyds.
\]

Hence, by Fubini theorem,
\[
\int_{\mathcal{Q}_{R/3}(0,0)} \eta u dx dt = \int_{\mathcal{Q}_{R/3}(0,0)} \theta \eta u dx dt
\]
\[
\lesssim A \int_{\mathbb{R}^{N+1}} (\theta|\nabla \xi| + \xi|\nabla \theta| + \theta|\Delta \xi| + \xi|\Delta \theta| + \theta|\partial_\xi \xi| + \xi|\partial_\theta \theta|) u \, dyds
\]
\[
\lesssim \int_{\mathbb{R}^{N+1}} (|\partial_\xi \xi| + |\nabla \xi| + |\Delta \xi|) u \, dyds + \sup_{\mathcal{Q}_{R/3}(0,0) \setminus \mathcal{Q}_{R/4}(0,0)} u,
\]
where
\[
A = \sup_{(y,s)\in \bar{Q}(0,0)} \int_{\bar{Q}(0,0)} \left((\max\{|x-y|,|t-s|^{1/2}\})^{-N} + (\max\{|x-y|,|t-s|^{1/2}\})^{-N-1}\right) dx \, dt.
\]

Therefore we obtain (3.20) from (3.18) and (3.19).

**Proposition 3.8** Let \(0 < \varepsilon < 1\), \(K \subset \{(x, t) : \varepsilon < \max\{|x|,|t|^{1/2}\} < 1\}\) be a compact set and \(u\) the maximal solution of (3.7) in \(\bar{Q}(0,0)\)\(\setminus K\) with \(R \geq 100\). Then
\[
\sup_{Q_{\varepsilon/4}(0,0)} u \lesssim \sum_{j=0}^{j_*-2} \frac{\text{Cap}_{2,1,q}(K \cap \bar{Q}_{\rho_j}(0,0))}{\rho_j^N} + \varepsilon R^{-\frac{q}{q-1}} \quad \text{if} \quad q > q_*,
\]
and
\[
\sup_{Q_{\varepsilon/4}(0,0)} u \lesssim \sum_{j=0}^{j_*} \frac{\text{Cap}_{2,1,q}(K_j)}{\rho_j^N} + \varepsilon R^{-\frac{q}{q-1}} \quad \text{if} \quad q = q_*,
\]
where \(\rho_j = 2^{-j}, K_j = \{(x/\rho_{j+3}, t/\rho_{j+3}^2) : (x, t) \in K \cap \bar{Q}_{\rho_j}(0,0)\}\) and \(j_\varepsilon \in \mathbb{N}\) is such that \(\rho_{j_\varepsilon} \lesssim \varepsilon < \rho_{j_\varepsilon-1}\).

**Proof.** For \(j \in \mathbb{N}\), we define \(S_j = \{x : \rho_j \leq \max\{|x|,|t|^{1/2}\} \leq \rho_{j-1}\}\). Fix any \(1 \leq j \leq j_\varepsilon\). We cover \(S_j\) by \(L = L(N) \in \mathbb{N}^*\) closed cylinders
\[
\bar{Q}_{\rho_{j+3}}(x_{k,j},t_{k,j}), \quad k = 1, \ldots, L(N),
\]
where \((x_{k,j},t_{k,j}) \in S_j\).

For \(k = 1, \ldots, L(N)\), let \(u_{j,k}, u_{j,k}\) be the maximal solutions of (3.7) where \(K\) is replaced by \(K \cap S_j\) and \(K \cap \bar{Q}_{\rho_{j+3}}(x_{k,j},t_{k,j})\), respectively. Clearly the function \(\tilde{u}_{k,j}\) defined by
\[
\tilde{u}_{k,j}(x,t) = \rho_{j+3}^{-\frac{q}{q-1}} u_{k,j}(\rho_{j+3} x + x_{k,j}, \rho_{j+3}^2 t + t_{k,j})
\]
is the maximal solution of (3.7) provided \((K_{k,j}, \bar{Q}_{R/\rho_{j+3}}(-x_{k,j}/\rho_{j+3}, -t_{k,j}/\rho_{j+3}^2))\) with
\[
K_{k,j} = \{(y/\rho_{j+3}, s/\rho_{j+3}^2) : (y, s) \in (-x_{k,j}, t_{k,j}) + K \cap \bar{Q}_{\rho_{j+3}}(x_{k,j}, t_{k,j})\} \subset Q_1(0,0)
\]
is replacing \((K, \bar{Q}_R(0,0))\). Let \(\bar{u}_{k,j}\) be the maximal solution of (3.7) with \((K, \bar{Q}_R(0,0))\) replaced by \((K_{k,j}, \bar{Q}_{R/\rho_{j+3}}(0,0))\). Since \(\bar{Q}_{R/\rho_{j+3}}(-x_{k,j}/\rho_{j+3}, -t_{k,j}/\rho_{j+3}^2) \subset \bar{Q}_{2R/\rho_{j+3}}(0,0)\), then by the comparison principle as in the proof of Proposition 3.1, we get \(\tilde{u}_{k,j} \leq \bar{u}_{k,j}\) in \(\bar{Q}_{R/\rho_{j+3}}(-x_{k,j}/\rho_{j+3}, -t_{k,j}/\rho_{j+3}^2)\setminus K_{k,j}\), and thus
\[
\tilde{u}_{k,j}(x,t) \lesssim \text{Cap}_{2,1,q}(K_{k,j}) + (R/\rho_{j+3})^{-\frac{q}{q-1}},
\]
for any \((x,t) \in \left(\bar{Q}_{2R/(5\rho_{j+3})}(0,0) \cap \bar{Q}_{R/\rho_{j+3}}(-x_{k,j}/\rho_{j+3}, -t_{k,j}/\rho_{j+3}^2)\right) \setminus \bar{Q}_2(0,0) = D\).

Fix \((x_0, t_0) \in \bar{Q}_{\varepsilon/4}(0,0)\). Clearly, \((x_0 - x_{k,j})/\rho_{j+3}, (t_0 - t_{k,j})/\rho_{j+3}^2) \in D\), hence
\[
u_{k,j}(x_0, t_0) = \rho_{j+3}^{-\frac{q}{q-1}} \tilde{u}_{k,j}((x_0 - x_{k,j})/\rho_{j+3}, (t_0 - t_{k,j})/\rho_{j+3}^2)
\]
\[
\lesssim \frac{\text{Cap}_{2,1,q}(K_{k,j})}{\rho_j^{-\frac{q}{q-1}}} + R^{-\frac{q}{q-1}}.
\]
Therefore, using (3.9) in Remark 3.2 and the fact that
\[
\text{Cap}_{2,1,q}(K_{k,j}) = \text{Cap}_{2,1,q}((x_{k,j}/\rho_{j+3}, t_{k,j}/\rho_{j+3}^2)) \leq \text{Cap}_{2,1,q}(K_j),
\]
and the proof is completed. \(\square\)
where the constant in the inequality \( \lesssim \) which implies (3.23).

which yields (3.24). If \( q > q_* \), then by (2.2) in Proposition 2.5, we have

\[
\text{Cap}_{2,1,q'}(K_j) \lesssim \rho_{j+3}^{-N-2+2q'} \text{Cap}_{2,1,q'}(K \cap \tilde{Q}_{\rho_j} (0,0)),
\]

which implies (3.23).

**Proposition 3.9** Let \( K, u, \xi \) be as in Proposition 3.7. For any compact set \( K_0 \) in \( Q_1(0,0) \) with positive measure \( |K_0| \), there exists \( \varepsilon = \varepsilon(N, q, |K_0|) > 0 \) such that

\[
\text{Cap}_{2,1,q'}(K) \leq \varepsilon \Rightarrow \inf_{K_0} u \lesssim \int_{Q_2(0,0)} u \xi dx dt,
\]

where the constant in the inequality \( \lesssim \) depends on \( K_0 \). In particular,

\[
\text{Cap}_{2,1,q'}(K) \leq \varepsilon \Rightarrow \inf_{K_0} u \lesssim \text{Cap}_{2,1,q'}(K) + R^{-\frac{2}{2+2q'}}. \tag{3.25}
\]

**Proof.** It is enough to prove that there exists \( \varepsilon > 0 \) such that

\[
\text{Cap}_{2,1,q'}(K) \leq \varepsilon \Rightarrow |K_1| \geq \frac{1}{2} |K_0|, \tag{3.26}
\]

where \( K_1 = \{(x, t) \in K_0 : \xi(x,t) \geq 1/2\} \). By (2.1) in Proposition 2.5, we have the following estimates

\[
|K_0 \setminus K_1|^{1-\frac{2q'}{2+2q'}} \lesssim \text{Cap}_{2,1,q'}(K_0 \setminus K_1),
\]

if \( q > q_* \), and

\[
\left( \log \left( \frac{|Q_{200}(0,0)|}{|K_0 \setminus K_1|} \right) \right)^{-\frac{N}{2}} \lesssim \text{Cap}_{2,1,q'}(K_0 \setminus K_1),
\]

if \( q = q_* \). On the other hand,

\[
\text{Cap}_{2,1,q'}(K_0 \setminus K_1) = \text{Cap}_{2,1,q'}(\{K_0 : \varphi > 1 - (1/2)^{1/(2q')}\})
\]

\[
\leq (1 - (1/2)^{1/(2q')})^{-q'} \int_{R^{N+1}} \left( |D^2 \varphi|^{q'} + |\nabla \varphi|^{q'} + |\varphi|^{q'} + |\partial_t \varphi|^{q'} \right) dx dt
\]

\[
\lesssim \text{Cap}_{2,1,q'}(K),
\]

where \( \varphi \) is in Proposition 3.7. Henceforth, one can find \( \varepsilon = \varepsilon(N, q, |K_0|) > 0 \) such that

\[
\text{Cap}_{2,1,q'}(K) \leq \varepsilon \Rightarrow |K_0 \setminus K_1| \leq \frac{1}{2} |K_0|.
\]

This implies (3.26). \( \blacksquare \)

### 4 Large solutions

In the first part of this section, we prove theorem 1.1-(ii), then we prove theorems 1.1-(i) and 1.2. At end we apply our result to a parabolic viscous Hamilton-Jacobi equation.
4.1 Proof of Theorem 1.1-(ii)

Let $R_0 \geq 4$ such that $O \subset \bar{Q}_{R_0}(0,0)$. Assume that the equation (1.13) has a large solution $u$. We claim that (1.15) holds with $(x,t) \in \partial O$, and without loss of generality, we can assume $(x,t) = (0,0)$. Set $K = Q_{2R_0}(0,0) \setminus O$ and define

$$T_j = \{x : \rho_j \leq |x|, t \leq 0\},$$
$$\bar{T}_j = \{x : \rho_j \leq |x|, t \leq 0\}.$$

Here $\rho_j = 2^{-j}$. For $j \geq 3$, let $u_1, u_2, u_3, u_4$ be the maximal solutions of (3.7) when $K$ is replaced by $K \cap Q_{\rho_{j+3}}(0,0), K \cap \bar{T}_j, (K \cap Q_j(0,0)) \setminus Q_{\rho_{j+2}}(0,0)$ and $K \setminus Q_j(0,0)$ respectively and $R \geq 100R_0$. From (3.9) in Remark 3.2, we can assert that

$$u \leq u_1 + u_2 + u_3 + u_4 \quad \text{in} \quad O \cap \{(x,t) \in \mathbb{R}^{N+1} : t \leq 0\}.$$ 

Thus,

$$\inf_{T_j} u \leq ||u_1||_{L^\infty(T_j)} + ||u_2||_{L^\infty(T_j)} + ||u_3||_{L^\infty(T_j)} + \inf_{T_j} u_4. \quad (4.1)$$

Case 1: $q > q_*$. By (3.8) in Remark 3.2,

$$||u_4||_{L^\infty(T_j)} \lesssim 1.$$ 

By (3.23) in Proposition 3.8,

$$||u_3||_{L^\infty(T_j)} \lesssim \frac{\rho_j^N}{j R^{-\frac{N}{q'}}}. \quad (4.3)$$

Since $(x,t) \mapsto \pi_1(x,t) = 2^{2/(q-1)} u_2(\rho_{j+3}, x, \rho_{j+3} t)$ is the maximal solution of (3.7) when $(K, \bar{Q}_R(0,0))$ is replaced by $\{ (y/\rho_{j+3}, s/\rho_{j+3}^2) : (y,s) \in K \cap Q_{\rho_{j+3}}(0,0), \bar{Q}_{R/\rho_{j+3}}(0,0) \}$, we derive

$$||\pi_1||_{L^\infty(T_{-2})} \lesssim \frac{\rho_j^N}{j R^{-\frac{N}{q'}}} + (R/\rho_j)^{-\frac{2}{q'}}.$$ 

thanks to (3.19) in Proposition 3.7 and (2.2) in Proposition 2.5, from which follows

$$||u_1||_{L^\infty(T_j)} \lesssim \frac{\rho_j^N}{j R^{-\frac{N}{q'}}} + R^{-\frac{N}{q'}}. \quad (4.4)$$

Since $(x,t) \mapsto \pi_2(x,t) = 2^{2/(q-1)} u_2(\rho_{j-2}, x, \rho_{j-2} t)$ is the maximal solution of (3.7) when the couple $(K, \bar{Q}_R(0,0))$ is replaced by $\{ (y/\rho_{j-2}, s/\rho_{j-2}^2) : (y,s) \in K \cap \bar{T}_j, \bar{Q}_{R/\rho_{j-2}}(0,0) \}$, Proposition 3.9 and relation (2.2) in Proposition 2.5 yield

$$\frac{\rho_j^N}{j R^{-\frac{N}{q'}}} \leq \varepsilon \Rightarrow \inf_{T_j} \pi_2 \lesssim \frac{\rho_j^N}{j R^{-\frac{N}{q'}}} + (R/\rho_j)^{-\frac{2}{q'}},$$ 

which implies

$$\frac{\rho_j^N}{j R^{-\frac{N}{q'}}} \leq \varepsilon \Rightarrow \inf_{T_j} u_2 \lesssim \frac{\rho_j^N}{j R^{-\frac{N}{q'}}} + (R/\rho_j)^{-\frac{2}{q'}}, \quad (4.5)$$

for some $\varepsilon = \varepsilon(N, q) > 0$.

First, we assume that there exists $J \in \mathbb{N}, J \geq 10$ such that

$$\frac{\rho_j^N}{j R^{-\frac{N}{q'}}} \leq \varepsilon \quad \forall j \geq J.$$
Then, from (4.1) and (4.2), (4.3), (4.4), (4.5), we have
\[
\inf_{T_j} u \lesssim \sum_{i=-2}^{j+2} \frac{\text{Cap}_{2,1,q'}(K \cap Q_{\rho_i}(0,0))}{\rho_i^N} + jR^{-\frac{2}{q'}} + 1,
\]
for any \( j \geq J \), and letting \( R \to \infty \),
\[
\inf_{T_j} u \lesssim \sum_{i=-2}^{j+2} \frac{\text{Cap}_{2,1,q'}(K \cap Q_{\rho_i}(0,0))}{\rho_i^N} + 1.
\]
Since \( \inf_{T_j} u \to \infty \) as \( j \to \infty \), we get
\[
\sum_{i=0}^\infty \frac{\text{Cap}_{2,1,q'}(K \cap Q_{\rho_i}(0,0))}{\rho_i^N} = \infty,
\]
which implies that (1.15) holds with \((x, t) = (0, 0)\).

Alternatively, assume that for infinitely many \( j \)
\[
\frac{\text{Cap}_{2,1,q'}(K \cap Q_{\rho_j-3}(0,0))}{\rho_j^{N+2-2q'}} > \varepsilon,
\]
then,
\[
\frac{\text{Cap}_{2,1,q'}(K \cap Q_{\rho_j-3}(0,0))}{\rho_j^{N+2-2q'}} > \rho_j^{2-2q'} \varepsilon \to \infty \quad \text{when} \quad j \to \infty.
\]
We also derive that (1.15) holds with \((x, t) = (0, 0)\). This proves the case \( q > q_* \).

**Case 2:** \( q = q_* \). Similarly to Case 1, we have: for \( j \geq 6 \)
\[
||u_4||_{L^\infty(T_j)} \lesssim 1, \quad (4.6)
\]
\[
||u_3||_{L^\infty(T_j)} \lesssim \sum_{i=0}^{j-2} \frac{\text{Cap}_{2,1,q'}(K_j)}{\rho_i^N} + jR^{-\frac{2}{q'}}, \quad (4.7)
\]
\[
||u_1||_{L^\infty(T_j)} \lesssim \frac{\text{Cap}_{2,1,q'}(K_j)}{\rho_j^N} + R^{-\frac{2}{q'}}, \quad (4.8)
\]
\[
\text{Cap}_{2,1,q'}(K_{j-5}) \leq \varepsilon \Rightarrow \inf_{T_j} u_2 \lesssim \frac{\text{Cap}_{2,1,q'}(K_{j-5})}{\rho_j^N} + R^{-\frac{2}{q'}}, \quad (4.9)
\]
where \( K_j = \{(x/\rho_j+3,t/\rho_j^{j+3}) : (x, t) \in K \cap Q_{\rho_j-3}(0,0)\} \) and \( \varepsilon = \varepsilon(N) > 0 \).

From (2.2) in Proposition 2.5, we have
\[
\frac{1}{\text{Cap}_{2,1,q'}(K \cap Q_{\rho_j-3}(0,0))} \leq \frac{c}{\text{Cap}_{2,1,q'}(K_j)} + cj^{N/2}
\]
for any \( j \geq 4 \) where \( c = c(N) \). If there are infinitely many \( j \geq 4 \) such that
\[
\text{Cap}_{2,1,q'}(K \cap Q_{\rho_j-3}(0,0)) > \frac{1}{2cj^{N/2}},
\]
then (1.15) holds with \((x, t) = (0, 0)\) since
\[
\frac{\text{Cap}_{2,1,q'}(K \cap Q_{\rho_j-3}(0,0))}{\rho_j^{N-3}} > \frac{2j^{-3}}{2cj^{N/2}} \to \infty \quad \text{when} \quad j \to \infty.
\]
Now, we assume that there exists $J \geq 6$ such that

$$\Cap_{2,1,q'}(K \cap Q_{\rho_{j-3}}(0,0)) \leq \frac{1}{2cJ^{3/2}} \quad \forall \ j \geq J.$$ 

Then,

$$\Cap_{2,1,q'}(K_j) \leq 2c\Cap_{2,1,q'}(K \cap Q_{\rho_{j-3}}(0,0)) \quad \forall \ j \geq J.$$ 

This leads to

$$\Cap_{2,1,q'}(K_j) \leq 2c\Cap_{2,1,q'}(K \cap Q_{\rho_{j-3}}(0,0)) \leq \varepsilon \quad \forall \ j \geq J' + J,$$

for some $J' = J'(N)$. Hence, from (4.6)-(4.9) we have, for any $j \geq J' + J + 3$,

$$||u_4||_{L^\infty(T_j)} \leq 1,$$

$$||u_3||_{L^\infty(T_j)} \leq \sum_{i=J'+J+1}^{j-2} \frac{\Cap_{2,1,q'}(K \cap Q_{\rho_{i-3}}(0,0))}{\rho_i^N} + C(J' + J) + jR^{-\frac{2}{p+2}},$$

$$||u_1||_{L^\infty(T_j)} \leq \frac{\Cap_{2,1,q'}(K \cap Q_{\rho_{j-3}}(0,0))}{\rho_j^N} + R^{-\frac{2}{p+2}},$$

$$\inf_{T_j} \inf Q \leq \frac{\Cap_{2,1,q'}(K \cap Q_{\rho_{j-3}}(0,0))}{\rho_j^N} + R^{-\frac{2}{p+2}},$$

where $C(J' + J) = \sum_{i=0}^{J'+J} \Cap_{2,1,q'}(K_j)$. Consequently we derive

$$\inf_{T_j} \inf \leq \sum_{i=0}^{j} \frac{\Cap_{2,1,q'}(K \cap Q_{\rho_i}(0,0))}{\rho_j^N} + C(J' + J) + 1 + jR^{-\frac{2}{p+2}} \quad \forall \ j \geq J' + J + 3$$

from (4.1). Letting $R \to \infty$ and $j \to \infty$ we obtain

$$\sum_{i=0}^{\infty} \frac{\Cap_{2,1,q'}(K \cap Q_{\rho_i}(0,0))}{\rho_i^N} = \infty,$$

i.e. (1.15) holds with $(x, t) = (0, 0)$. This completes the proof of Theorem 1.1-(ii).

### 4.2 Proof of Theorem 1.1-(i) and Theorem 1.2

Fix $(x_0, t_0) \in \partial_O$. We can assume that $(x_0, t_0) = 0$. Let $\delta \in (0, 1/100)$. For $(y_0, s_0) \in (B_3(0) \times (-\delta^2, \delta^2)) \cap O$, we set

$$M_k = O^c \cap \left( B_{r_{k+2}}(y_0) \times [s_0 - (73 + \frac{1}{2})r_{k+2}^2, s_0 - (70 + \frac{1}{2})r_{k+2}^2] \right),$$

and

$$S_k = \{(x, t) : r_{k+1} \leq \max\{|x-y_0|, |t-s_0|^\frac{1}{2}\} < r_k \} \quad \text{for} \ k = 1, 2, ..., \text{such that} \ O \subset \subset \bar{Q}_{R_0}(0,0).$$

By Theorems 2.2 and 2.4 and estimate (1.12) there exist two sequences $\{\mu_k\}_k$ and $\{\nu_k\}_k$ of nonnegative Radon measures such that

$$\sup\{\mu_k\} \subset M_k, \sup\{\nu_k\} \subset M_k,$$

$$\mu_k(M_k) \simeq \Cap_{2,1,q'}(M_k) \simeq \int_{\mathbb{R}^{n+1}} \left( \frac{r_k}{2} \right)^q dxdet \quad \text{(1.11)}$$

$$\text{(1.10)}$$
and
\[ \nu_k(M_k) \asymp \mathcal{P} \mathcal{H}_1^N(M_k), \quad ||M_1^{2R_0}||_{L^\infty(\mathbb{R}^{N+1})} \leq 1 \quad \text{for } k = 1, 2, \ldots \]  
(4.12)
where the constants of equivalence depend on \( N, q, R_0 \).

Take \( \varepsilon > 0 \) such that \( \exp\left( C_1 \varepsilon^2 R_0 \sum_{k=1}^\infty \nu_k \right) \in L^1(\tilde{Q}_{R_0}(0,0)) \), in which expression the constant \( C_1 = C_1(N) \) is the one of inequality (2.6). By Theorem 2.7 and Proposition 2.8, there exist two nonnegative solutions \( U_1, U_2 \) of problems
\[ \partial_t U_1 - \Delta U_1 + U_1^q = \varepsilon \sum_{k=1}^\infty \mu_k \quad \text{in } \tilde{Q}_{R_0}(0,0), \]
\[ U_1 = 0 \quad \text{on } \partial_p \tilde{Q}_{R_0}(0,0), \]
and
\[ \partial_t U_2 - \Delta U_2 + \varepsilon U_2 - 1 = \varepsilon \sum_{k=1}^\infty \nu_k \quad \text{in } \tilde{Q}_{R_0}(0,0), \]
\[ U_2 = 0 \quad \text{on } \partial_p \tilde{Q}_{R_0}(0,0), \]
respectively which satisfy
\[ U_1(y_0, z_0) \geq \sum_{i=0}^\infty \sum_{k=1}^\infty \varepsilon \frac{\mu_k(B_{y_0}(y_0) \times (s_0 - \frac{3\varepsilon^2}{128 r_i^2}, s_0 - \frac{35\varepsilon^2}{128 r_i^2}))}{r_i^N} \]
\[ - \frac{1}{2}\frac{\sum_{k=1}^\infty \mu_k}{\varepsilon^2 R_0} \left[ \left( \frac{1}{2} \frac{\sum_{k=1}^\infty \mu_k}{\varepsilon} \right)^q \right]^q (y_0, s_0) =: A, \]
(4.13)
and
\[ U_2(y_0, z_0) \geq \sum_{i=0}^\infty \sum_{k=1}^\infty \varepsilon \frac{\nu_k(B_{y_0}(y_0) \times (s_0 - \frac{3\varepsilon^2}{128 r_i^2}, s_0 - \frac{35\varepsilon^2}{128 r_i^2}))}{r_i^N} \]
\[ - \frac{1}{2}\frac{\sum_{k=1}^\infty \nu_k}{\varepsilon^2 R_0} \exp\left( C_1 \frac{1}{2} \frac{\sum_{k=1}^\infty \nu_k}{\varepsilon} \right) - 1 \right] (y_0, s_0) =: B, \]
(4.14)
and \( U_1, U_2 \in C^{2,1}(O) \).
Let \( u_1, u_2 \) be the maximal solutions of equations (3.1) and (3.16) respectively. We have \( u_1(y_0, s_0) \geq U_1(y_0, s_0) \) and \( u_2(y_0, s_0) \geq U_2(y_0, s_0) \). Now, we claim that
\[ A \geq \sum_{k=1}^\infty \frac{\Cap_{2,1,q'}(M_k)}{r_k^N}, \]
(4.15)
and
\[ B \geq -c_1(R_0) + \sum_{k=1}^\infty \frac{\mathcal{P} \mathcal{H}_1^N(M_k)}{r_k^N}. \]
(4.16)

**Proof of assertion (4.15).** From (4.11) we have
\[ A \geq \varepsilon \sum_{k=1}^\infty \frac{\Cap_{2,1,q'}(M_k)}{r_k^N} - \varepsilon^q A_0, \]
(4.17)
with
\[ A_0 = \frac{\sum_{k=1}^\infty \mu_k}{\varepsilon^2 R_0} \left[ \left( \frac{1}{2} \frac{\sum_{k=1}^\infty \mu_k}{\varepsilon} \right)^q \right] (y_0, s_0). \]
Take $i_0 \in \mathbb{Z}$ such that $r_{i_0 + 1} < \max\{2R_0, 1\} \leq r_{i_0}$. Then

$$A_0 \lesssim \sum_{j=i_0}^{\infty} r_j^{-N} \int_{Q_{r_j}(y_{i_0}, s_0)} \left( \|S_2^{R_0}(\sum_{k=1}^{\infty} \mu_k) \right) \| dx \, dt$$

$$= \sum_{i=i_0}^{\infty} \sum_{j=i}^{\infty} r_j^{-N} \int_{S_j} \left( \|S_2^{R_0}(\sum_{k=1}^{\infty} \mu_k) \right) \| dx \, dt$$

$$= \sum_{j=k_0}^{\infty} \sum_{i=k_0}^{j} r_j^{-N} \int_{S_j} \left( \|S_2^{R_0}(\sum_{k=1}^{\infty} \mu_k) \right) \| dx \, dt$$

$$\lesssim \sum_{j=i_0}^{\infty} r_j^{-N} \int_{S_j} \left( \|S_2^{R_0}(\sum_{k=1}^{\infty} \mu_k) \right) \| dx \, dt.$$

Here we have used the fact that $\sum_{j=i_0}^{\infty} r_j^{-N} \leq \frac{1}{4} r_j^{-N}$ for all $j$. If we set $\mu_k \equiv 0$ for all $i_0 - 1 \leq k \leq 0$, the previous inequality becomes

$$A_0 \lesssim \sum_{j=i_0}^{\infty} r_j^{-N} \int_{S_j} \left( \|S_2^{R_0}(\mu_j + \sum_{k=i_0-1}^{j-1} \mu_k + \sum_{k=j+1}^{\infty} \mu_k) \right) \| dx \, dt$$

$$\lesssim \sum_{j=i_0}^{\infty} r_j^{-N} \int_{S_j} \left( \|S_2^{R_0}(\mu_j) \right) \| dx \, dt$$

$$+ \sum_{j=i_0}^{\infty} r_j^{-N} \left( \sum_{k=i_0-1}^{j-1} \|\|S_2^{R_0}(\mu_k)\|_{L^\infty(S_j)} \right)$$

$$+ \sum_{j=i_0}^{\infty} r_j^{-N} \left( \sum_{k=j+1}^{\infty} \|\|S_2^{R_0}(\mu_k)\|_{L^\infty(S_j)} \right)$$

$$= A_1 + A_2 + A_3. \quad (4.18)$$

Using (4.11) we obtain

$$A_1 \leq \sum_{k=1}^{\infty} \text{Cap}_{2,1,q} \left( M_k \right) \frac{r_k}{r_k^N}. \quad (4.19)$$

Next, using (4.10) we have for any $(x, t) \in S_j$

$$\|S_2^{R_0} \mu_k \| (x, t) = \int_{r_{j+1}}^{2R_0} \frac{\mu_k(Q(x, t)) \, d\rho}{\rho^N} \lesssim \frac{\mu_k(\mathbb{R}^{N+1})}{r_j^N} \quad (4.20)$$

if $k \geq j + 1$, and

$$\|S_2^{R_0} \mu_k \| (x, t) = \int_{r_{k+1}}^{2R_0} \frac{\mu_k(Q(x, t)) \, d\rho}{\rho^N} \lesssim \frac{\mu_k(\mathbb{R}^{N+1})}{r_k^N} \quad (4.21)$$

if $k \leq j - 1$. Thus,

$$A_2 \lesssim \sum_{j=i_0}^{\infty} r_j^2 \left( \sum_{k=i_0-1}^{j-1} \frac{\mu_k(\mathbb{R}^{N+1})}{r_k^N} \right)^q,$$

and

$$A_3 \lesssim \sum_{j=i_0}^{\infty} r_j^{2-Nq} \left( \sum_{k=j+1}^{\infty} \frac{\mu_k(\mathbb{R}^{N+1})}{r_k^N} \right)^q.$$
Noticing that \((a + b)^q - a^q \leq q(a + b)^{q-1}b\) for any \(a, b \geq 0\), we get
\[
(1 - 4^{-2}) \sum_{j=10}^{\infty} r_j^2 \left( \sum_{k=i_0-1}^{j-1} \frac{\mu_k(\mathbb{R}^{N+1})}{r_k^N} \right)^q = \sum_{j=10}^{\infty} r_j^2 \left( \sum_{k=i_0-1}^{j-1} \frac{\mu_k(\mathbb{R}^{N+1})}{r_k^N} \right)^q - \sum_{j=i_0+1}^{\infty} r_j^2 \left( \sum_{k=i_0-1}^{j-2} \frac{\mu_k(\mathbb{R}^{N+1})}{r_k^N} \right)^q 
\]
\[
\leq \sum_{j=i_0}^{\infty} r_j^2 \left( \sum_{k=i_0-1}^{j-1} \frac{\mu_k(\mathbb{R}^{N+1})}{r_k^N} \right)^{q-1} \frac{\mu_{j-1}(\mathbb{R}^{N+1})}{r_{j-1}^N}
\]

Similarly, we also have
\[
(1 - 4^{2-Nq}) \sum_{j=10}^{\infty} r_j^{2-Nq} \left( \sum_{k=j+1}^{\infty} \mu_k(\mathbb{R}^{N+1}) \right)^q \leq \sum_{j=i_0}^{\infty} r_j^{2-Nq} \left( \sum_{k=j+1}^{\infty} \mu_k(\mathbb{R}^{N+1}) \right)^{q-1} \frac{\mu_{j+1}(\mathbb{R}^{N+1})}{r_{j+1}^N}
\]

Therefore,
\[
A_2 + A_3 \lesssim \sum_{j=10}^{\infty} r_j^2 \left( \sum_{k=i_0-1}^{j-1} \frac{\mu_k(\mathbb{R}^{N+1})}{r_k^N} \right)^{q-1} \frac{\mu_{j-1}(\mathbb{R}^{N+1})}{r_{j-1}^N}

+ \sum_{j=i_0}^{\infty} r_j^{2-Nq} \left( \sum_{k=j+1}^{\infty} \mu_k(\mathbb{R}^{N+1}) \right)^{q-1} \frac{\mu_{j+1}(\mathbb{R}^{N+1})}{r_{j+1}^N}
\]

Since \(\mu_k(\mathbb{R}^{N+1}) \lesssim r_k^{N+2-2q}\) if \(q > q_*\) and \(\mu_k(\mathbb{R}^{N+1}) \lesssim \min\{1, k^{-\frac{1}{N}}\}\) if \(q = q_*\) for any \(k\), we infer that
\[
r_j^2 \left( \sum_{k=i_0-1}^{j-1} \frac{\mu_k(\mathbb{R}^{N+1})}{r_k^N} \right)^{q-1} \lesssim 1,
\]
and
\[
r_j^{2-Nq} \left( \sum_{k=j+1}^{\infty} \mu_k(\mathbb{R}^{N+1}) \right)^{q-1} \lesssim r_j^{-N} \text{ for any } j.
\]

In the case \(q = q_*\) we assume \(N \geq 3\) in order to ensure that
\[
\sum_{j=1}^{\infty} \mu_k(\mathbb{R}^{N+1}) \lesssim \sum_{k=1}^{\infty} k^{-\frac{1}{N}} < \infty.
\]
This leads to
\[
A_2 + A_3 \lesssim \sum_{k=1}^{\infty} \frac{\mu_k(\mathbb{R}^{N+1})}{r_k^N}
\]
Combining this with (4.19) and (4.18), we deduce
\[
A_0 \lesssim \sum_{k=1}^{\infty} \frac{\text{Cap}_{2, q}(M_k)}{r_k^N},
\]
Consequently, we obtain (4.15) from (4.17), for $\varepsilon$ small enough.

**Proof of assertion (4.16).** From (4.12) we get

$$B \gtrsim \varepsilon \sum_{k=1}^{\infty} \frac{\mathcal{P}H^N_1(M_k)}{r_k^{N-1}} - B_0,$$

where

$$B_0 = \frac{1}{2} \exp \left( C_1 \left[ e^{\sum_{k=1}^{\infty} \nu_k} \right] - 1 \right) (y_0, s_0).$$

We show that

$$B_0 \leq c(N, q, R_0) \text{ for } \varepsilon \text{ small enough. (4.22)}$$

In fact, as above we have

$$B_0 \lesssim \sum_{j=i_0}^{\infty} r_j^{-N} \int_{S_j} \exp \left( C_1 \sum_{k=1}^{\infty} \nu_k \right) \, dxdt.$$

Consequently,

$$B_0 \lesssim \sum_{j=i_0}^{\infty} r_j^{-N} \int_{S_j} \exp \left( 3C_1 \sum_{k=1}^{\infty} \nu_k \right) \, dxdt$$

$$+ \sum_{j=i_0}^{\infty} r_j^2 \exp \left( 3C_1 \sum_{k=1}^{N_{2^{R_0}}(\nu_k)} \right)$$

$$+ \sum_{j=i_0}^{\infty} r_j^2 \exp \left( 3C_1 \sum_{k=1}^{N_{2^{R_0}}(\nu_k)} \right)$$

$$= B_1 + B_2 + B_3. \quad (4.23)$$

Here we have used the convexity inequality $3 \exp(a + b + c) \leq \exp(3a) + \exp(3b) + \exp(3c)$ for all real numbers $a, b, c$.

By Theorem 2.3, we have

$$\int_{S_j} \exp \left( 3C_1 \sum_{k=1}^{\infty} \nu_k \right) \, dxdt \lesssim r_j^{N+2} \text{ for all } j,$$

for $\varepsilon > 0$ small enough. Hence,

$$B_1 \lesssim \sum_{j=i_0}^{\infty} r_j^2 \lesssim (\max\{2R_0, 1\})^2. \quad (4.24)$$

Note that estimates (4.20) and (4.21) are also true with $\nu_k$; we deduce

$$B_2 = \sum_{j=i_0}^{\infty} r_j^2 \exp \left( c_2 \varepsilon \sum_{k=1}^{N_{2^{R_0}}(\nu_k)} \frac{\mu_k(\mathbb{R}^{N+1})}{r_k^N} \right)$$

$$+ \sum_{j=i_0}^{\infty} r_j^2 \exp \left( c_2 \varepsilon \sum_{k=1}^{N_{2^{R_0}}(\nu_k)} \frac{\mu_k(\mathbb{R}^{N+1})}{r_j^N} \right).$$
From (4.12) we have \( \mu_k(\mathbb{R}^{N+1}) \lesssim r_k^N \) for all \( k \), therefore

\[
B_2 + B_3 \lesssim \sum_{j=10}^{\infty} r_j^2 \exp (c_3 \varepsilon (j - i_0)) + \sum_{j=10}^{\infty} r_j^2 \exp (c_3 \varepsilon )
\]

\[
\lesssim \sum_{j=10}^{\infty} \exp (c_3 \varepsilon (j - i_0) - 4 \log(2)j) + r_{i_0}^2
\]

\[
\leq c_4(N, q, R_0) \quad \text{for } \varepsilon \text{ small enough.}
\]

Combining this with (4.24) and (4.23) we obtain (4.22).

This implies straightforwardly \( \exp \left(C_1 \varepsilon \sum_{k=1}^{\infty} \nu_k \right) \in L^1(\bar{Q}_{R_0}(0, 0)) \).

We conclude that for any \((y_0, s_0) \in (B_\delta(0) \times (-\delta^2, \delta^2)) \cap O\),

\[
u_1(y_0, s_0) \geq \sum_{k=1}^{\infty} \frac{\text{Cap}_{2,1,q'}(M_k(y_0, s_0))}{r_k^N},
\]

and

\[
u_2(y_0, s_0) \geq -c_1(R_0) + \sum_{k=1}^{\infty} \frac{\mathcal{P}H_1^N(M_k(y_0, s_0))}{r_k^N},
\]

where \( r_k = 4^{-k} \) and

\[
M_k(y_0, s_0) = O^c \cap \left( \overline{B_{r_{k+2}}(y_0)} \times [s_0 - (73 + \frac{1}{2})r_{k+2}^2, s_0 - (70 + \frac{1}{2})r_{k+2}^2] \right).
\]

If we take \( r_{k+4} \leq \delta < r_{k+3} \), we have for \( 1 \leq k \leq k_3 \)

\[
M_k(y_0, s_0) \supset O^c \cap \left( B_{r_{k+2}+\delta} \times \left( \delta^2 - (73 + \frac{1}{2})r_{k+2}^2, -\delta^2 - (70 + \frac{1}{2})r_{k+2}^2 \right) \right)
\]

\[
\supset O^c \cap \left( B_{r_{k+3}} \times (-73r_{k+3}^2, -71r_{k+3}^2) \right)
\]

\[
= O^c \cap \left( B_{r_{k+3}} \times (-1168r_{k+3}^2, -1136r_{k+3}^2) \right).
\]

Finally,

\[
\inf_{(y_0, s_0) \in (B_\delta(0) \times (-\delta^2, \delta^2)) \cap O} \nu_1(y_0, s_0)
\]

\[
\gtrsim -1 + \int_{r_{k+3}}^{1} \frac{\text{Cap}_{2,1,q'}(O^c \cap (B_\delta(0) \times (-17b^2, -b^2)))}{\rho^N} \frac{d\rho}{\rho} \quad \text{with } b = 1136
\]

\[
\gtrsim -1 + \int_{30r_{k+3}}^{1} \frac{\text{Cap}_{2,1,q'}(O^c \cap (B_\delta(0) \times (-30\rho^2, -\rho^2)))}{\rho^N} \frac{d\rho}{\rho} \to \infty \quad \text{as } \delta \to 0,
\]

and

\[
\inf_{(y_0, s_0) \in (B_\delta(0) \times (-\delta^2, \delta^2)) \cap O} \nu_2(y_0, s_0)
\]

\[
\gtrsim -1 + \int_{30r_{k+3}}^{1} \frac{\mathcal{P}H_1^N(O^c \cap (B_\delta(0) \times (-30\rho^2, -\rho^2)))}{\rho^N} \frac{d\rho}{\rho} \to \infty \quad \text{as } \delta \to 0.
\]

This completes the proof of Theorem 1.1-(i) and Theorem 1.2.

**Remark 4.1 (Uniqueness)** In [16], Marcus and Véron prove that condition (1.8) is not only a necessary and sufficient condition for the existence of a large solution to (1.7), but it
implies the uniqueness of a such a large solution when it is fulfilled. The main step for this proof is to show that there exists a constant $c = c(\Omega, q > 0)$ such that any couple of large solutions $(u, \bar{u})$ satisfies

$$u(x) \leq c\bar{u}(x) \quad \forall x \in \Omega.$$  \hfill (4.25)

The above estimate which is the key stone for proving uniqueness cannot be obtained in the case of the parabolic equation (1.13) since the necessary condition and the sufficient condition in Theorem 1.1 do not complement completely.

### 4.3 The viscous Hamilton-Jacobi parabolic equations

In this section we apply our previous result to the question of existence of a large solution of the following type of parabolic viscous Hamilton-Jacobi equation

$$\partial_t u - \Delta u + a|\nabla u|^p + bu = 0$$

$$u = \infty \quad \text{on } \partial_p O,$$  \hfill (4.26)

where $a > 0, b > 0$ and $1 < p \leq 2, q \geq 1$. First, we show that such a large solution to (4.26) does not exist when $q = 1$. Equivalently, there is no function $u \in C^{2,1}(O)$ satisfying

$$\partial_t u - \Delta u + a|\nabla u|^p \geq -bu$$

$$u = \infty \quad \text{on } \partial_p O.$$  \hfill (4.27)

for $a > 0, b > 0$ and $p > 1$. Indeed, assuming that such a function $u \in C^{2,1}(O)$ exists, we define

$$U(x, t) = u(x, t)e^{bt} - \frac{\varepsilon}{2}|x|^2,$$

for $\varepsilon > 0$ and denote by $(x_0, t_0) \in O \setminus \partial_p O$ the point where $U$ achieves its minimum in $O$, i.e. $U(x_0, t_0) = \inf\{U(x, t) : (x, t) \in O\}$. Clearly, we have

$$\partial_t U(x_0, t_0) \leq 0, \quad \Delta U(x_0, t_0) \geq 0 \quad \text{and} \quad \nabla U(x_0, t_0) = 0.$$

Thus,

$$\partial_t u(x_0, t_0) \leq -bu(x_0, t_0),$$

$$- \Delta u(x_0, t_0) \leq -\varepsilon Ne^{-bt_0}$$

and $a|\nabla u(x_0, t_0)|^p = ae^p|x_0|^pe^{-bt_0}$, from which follows

$$\partial_t u(x_0, t_0) - \Delta u(x_0, t_0) + a|\nabla u(x_0, t_0)|^p \leq -bu(x_0, t_0) + \varepsilon e^{-bt_0} \left(-N + ae^{-1}|x_0|^p e^{-(p-1)bt_0}\right)$$

$$< -bu(x_0, t_0)$$

for $\varepsilon$ small enough, which is a contradiction.

**Proof of Theorem 1.3.** By Remark 3.3, we have

$$\inf\{v(x, t) : (x, t) \in O\} \geq (q_1 - 1)^{-\frac{1}{q_1 - 1}} R^{-\frac{2}{q_1 - 1}}.$$

Take $V = \lambda v^\# \in C^{2,1}(O)$ for $\lambda > 0$. Thus $v = \lambda^{-\alpha}V^\alpha$,

$$\inf\{V(x, t) : (x, t) \in O\} > 0 \geq \lambda(q_1 - 1)^{-\frac{1}{q_1 - 1}} R^{-\frac{2}{q_1 - 1}},$$

and

$$\partial_t v - \Delta v + v^\alpha = \alpha \lambda^{-\alpha}V^{\alpha-1} \partial_t V - \alpha \lambda^{-\alpha}V^{\alpha-1} \Delta V + \alpha(1 - \alpha) \lambda^{-\alpha}V^{\alpha-1} \frac{\nabla V}{V} + \lambda^{-\alpha q_1} V^{\alpha q_1}.$$

This leads to

$$\partial_t V - \Delta V + (1 - \alpha) \frac{\nabla V}{V} + \alpha^{-1} \lambda^{-\alpha(q_1 - 1)} V^{\alpha q_1 - \alpha + 1} = 0 \quad \text{in } O.$$
Using Hölder’s inequality we obtain
\[
(1 - \alpha)\frac{|\nabla V|^2}{V} + (2\alpha)^{-1}\lambda^{-\alpha(q - 1)}V^{\alpha q_1 - \alpha + 1} \geq c_1|\nabla V|^p \lambda^{-\alpha(q - 1)(2 - p)\frac{1}{2}}V^{\alpha(q_1 - 1)(2 - p)\frac{1}{2} - (p - 1)} \\
\geq c_2|\nabla V|^p \lambda^{-(p - 1)}R^{-2 + p + \frac{2(q - 1)}{\alpha q_1 - 1}},
\]
and
\[
(2\alpha)^{-1}\lambda^{-\alpha(q - 1)}V^{\alpha q_1 - \alpha + 1} \geq c_3\lambda^{-(q - 1)}R^{-2 + \frac{2(q - 1)}{\alpha q_1 - 1}}V^q.
\]
If we choose
\[
\lambda = \min\{c_2^{-1}, c_3^{-1}\} \min \left\{ a^{-\frac{1}{p - 1}}R^{-\frac{2 - p}{p - 1} + \frac{2}{\alpha q_1 - 1}}, b^{-\frac{1}{q - 1}}R^{-\frac{2 - q}{q - 1} + \frac{2}{\alpha q_1 - 1}} \right\},
\]
then
\[
c_2\lambda^{-(p - 1)}R^{-2 + p + \frac{2(q - 1)}{\alpha q_1 - 1}} \geq a,
\]
\[
c_3\lambda^{-(q - 1)}R^{-2 + \frac{2(q - 1)}{\alpha q_1 - 1}} \geq b,
\]
from what follows
\[
\partial_t V - \Delta V + a|\nabla V|^p + bV^q \leq 0 \quad \text{in} \ O.
\]
By Remark 3.5, there exists a maximal solution \( u \in C^{2,1}(O) \) of
\[
\partial_t u - \Delta u + a|\nabla u|^p + bu^q = 0 \quad \text{in} \ O.
\]
Therefore, \( u \geq V = \lambda e^\frac{x}{\alpha} \) and \( u \) is a large solution of (4.26). This completes the proof of Theorem 1.3. \( \blacksquare \)

5 Appendix

Proof of Proposition 2.5.

Step 1. We claim that the following relation holds:
\[
\int_{\mathbb{R}^{N+1}} \left( \frac{1}{2} |\mu|(x,t) \right)^{(N+2)/N} \frac{dxdt}{r} = \int_{\mathbb{R}^{N+1}} \int_0^1 \left( \mu(\tilde{Q}_r(x,t)) \right)^{2/N} \frac{dr}{r} d\mu(x,t). \tag{5.1}
\]
In fact, we have for \( \rho_j = 2^{-j}, \ j \in \mathbb{Z}, \)
\[
\sum_{j=1}^{\infty} \int_{\mathbb{R}^{N+1}} \left( \mu(\tilde{Q}_{\rho_j}(x,t)) \right)^{2/N} d\mu(x,t) \lesssim \int_{\mathbb{R}^{N+1}} \int_0^1 \left( \mu(\tilde{Q}_r(x,t)) \right)^{2/N} \frac{dr}{r} d\mu(x,t)
\]
\[
\lesssim \sum_{j=0}^{\infty} \int_{\mathbb{R}^{N+1}} \left( \mu(\tilde{Q}_{\rho_j}(x,t)) \right)^{2/N} d\mu(x,t).
\]
Note that for any \( j \in \mathbb{Z} \)
\[
\rho_j^{-N-2} \int_{\mathbb{R}^{N+1}} \left( \mu(\tilde{Q}_{\rho_{j+1}}(x,t)) \right)^{(N+2)/N} \frac{dxdt}{r} \lesssim \int_{\mathbb{R}^{N+1}} \left( \mu(\tilde{Q}_{\rho_j}(x,t)) \right)^{2/N} d\mu(x,t)
\]
\[
\lesssim \rho_j^{-N-2} \int_{\mathbb{R}^{N+1}} \left( \mu(\tilde{Q}_{\rho_{j-1}}(x,t)) \right)^{(N+2)/N} \frac{dxdt}{r}.
\]
Thus, 
\[
\sum_{j=2}^{\infty} \rho_j^{-N} \int_{\mathbb{R}^{N+1}} (\mu(\tilde{Q}_r(x,t)))^{(N+2)/N} \, dx \, dt \lesssim \int_{\mathbb{R}^{N+1}} \int_{0}^{1} (\mu(\tilde{Q}_x(x,t)))^{2/N} \frac{dr}{r} \, d\mu(x,t) \\
\lesssim \sum_{j=1}^{\infty} \rho_j^{-N} \int_{\mathbb{R}^{N+1}} (\mu(\tilde{Q}_r(x,t)))^{(N+2)/N} \, dx \, dt.
\]
This yields 
\[
\int_{\mathbb{R}^{N+1}} \left(M_2^{1/4}[\mu](x,t) \right)^{(N+2)/N} \, dx \, dt \lesssim \int_{\mathbb{R}^{N+1}} \int_{0}^{1} (\mu(\tilde{Q}_x(x,t)))^{2/N} \frac{dr}{r} \, d\mu(x,t) \\
\lesssim \int_{\mathbb{R}^{N+1}} (I_2^1[\mu](x,t))^{(N+2)/N} \, dx \, dt.
\]
By [21, Theorem 4.2],
\[
\int_{\mathbb{R}^{N+1}} \left(M_2^{1/4}[\mu](x,t) \right)^{(N+2)/N} \, dx \, dt \asymp \int_{\mathbb{R}^{N+1}} (I_2^1[\mu](x,t))^{(N+2)/N} \, dx \, dt,
\]
thus we obtain (5.1).

**Step 2.** End of the proof. The first inequality in (2.1) is proved in [21]. We now prove the second inequality. By Theorem 2.4 there is \(\mu \in M^+(\mathbb{R}^{N+1})\), \(\text{supp}(\mu) \subset K\) such that 
\[
||M_2^1[\mu]||_{L^{(N+2)/N}(\mathbb{R}^{N+1})} \lesssim 1 \quad \text{and} \quad \mu(K) \asymp \mathcal{P}H^2_0(K) \geq |K|^{N/(N+2)}. \tag{5.2}
\]
Thanks to (5.1), we have for \(\delta = \min\{1, (\mu(K))^{1/N}\}\)
\[
||I_2^1[\mu]||_{L^{(N+2)/N}(\mathbb{R}^{N+1})} \asymp \int_{\mathbb{R}^{N+1}} \int_{0}^{1} (\mu(\tilde{Q}_x(x,t)))^{2/N} \frac{dr}{r} \, d\mu(x,t) \\
\asymp \int_{\mathbb{R}^{N+1}} \left( \int_{0}^{\delta} + \int_{\delta}^{1} \right) (\mu(\tilde{Q}_x(x,t)))^{2/N} \frac{dr}{r} \, d\mu(x,t) \\
\lesssim \int_{0}^{\delta} r \frac{dr}{r} \int_{\mathbb{R}^{N+1}} d\mu(x,t) + \int_{\delta}^{1} \frac{dr}{r} \left( \int_{\mathbb{R}^{N+1}} d\mu(x,t) \right)^{(N+2)/N} \\
\lesssim (\mu(K))^{(N+2)/N} \left( 1 + \log_+(\mu(K)^{-1}) \right) \\
\lesssim (\mu(K))^{(N+2)/N} \log \left( \frac{\hat{Q}_{200}(0,0)}{|K|} \right).
\]
Set \(\bar{\mu} = \left( \log \left( \frac{\hat{Q}_{200}(0,0)}{|K|} \right) \right)^{-N/(N+2)} \mu/K\), then 
\[
||I_2^1[\bar{\mu}]||_{L^{(N+2)/N}(\mathbb{R}^{N+1})} \lesssim 1.
\]
It is well known that 
\[
\text{Cap}_{2,1,\frac{N+2}{N+1}}(K) \asymp \sup\{ \omega(K) \}^{(N+2)/2} : \omega \in M^+(K), ||I_2^1[\omega]||_{L^{(N+2)/N}(\mathbb{R}^{N+1})} \lesssim 1 \}
\] 
see [21, Section 4]. This gives the second inequality in (2.1).

It is easy to prove (2.2) from its definition. Moreover, (5.3) implies that 
\[
\frac{1}{\text{Cap}_{2,1,\frac{N+2}{N+1}}(K)^{2/N}} \asymp \inf\{ ||I_2^1[\omega]||_{L^{(N+2)/N}(\mathbb{R}^{N+1})}^{(N+2)/N} : \omega \in M^+(K), \omega(K) = 1 \}.
\]
We deduce from (5.1) that 
\[
\frac{1}{\text{Cap}_{2,1,\frac{N+2}{N+1}}(K)^{2/N}} \asymp \inf\left\{ \int_{\mathbb{R}^{N+1}} \int_{0}^{1} (\omega(\tilde{Q}_x(x,t)))^{2/N} \frac{dr}{r} \, d\mu(x,t) : \omega \in M^+(K), \omega(K) = 1 \right\}. \tag{5.4}
\]
As in [12, proof of Lemma 2.2], it is easy to derive (2.3) from (5.4). □

**Proof of Proposition 2.6.** Thanks to the Poincaré inequality, it is enough to show that there exists \( \varphi \in C^\infty_c(\tilde{Q}_{3/2}(0,0)) \) such that

\[
0 \leq \varphi \leq 1, \text{ with } \varphi = 1 \text{ in an open neighborhood of } K \text{ and }
\]

\[
\int_{\mathbb{R}^{N+1}} (|D^2 \varphi|^p + |\partial_t \varphi|^p) \, dx \, dt \lesssim \text{Cap}_{2,1,p}(K). \tag{5.5}
\]

By definition, one can find \( 0 \leq \phi \in S(\mathbb{R}^{N+1}), \phi \geq 1 \) in a neighborhood of \( K \) such that

\[
\int_{\mathbb{R}^{N+1}} (|D^2 \phi|^p + |\nabla \phi|^p + |\phi|^p + |\partial_t \phi|^p) \, dx \, dt \leq 2\text{Cap}_{2,1,p}(K).
\]

Let \( \eta \) be a cut off function on \( \tilde{Q}_1(0,0) \) with respect to \( \tilde{Q}_{3/2}(0,0) \) and \( H \in C^\infty(\mathbb{R}) \) such that \( 0 \leq H(t) \leq t^+ \), \( |t||H''(t)| \lesssim 1 \) for all \( t \in \mathbb{R} \), \( H(t) = 0 \) for \( t \leq 1/4 \) and \( H(t) = 1 \) for \( t \geq 3/4 \).

We claim that

\[
\int_{\mathbb{R}^{N+1}} (|D^2 \varphi|^p + |\partial_t \varphi|^p) \, dx \, dt \lesssim \int_{\mathbb{R}^{N+1}} (|D^2 \phi|^p + |\nabla \phi|^p + |\phi|^p + |\partial_t \phi|^p) \, dx \, dt, \tag{5.6}
\]

where \( \varphi = \eta H(\phi) \). Indeed, we have

\[
|D^2 \varphi| \lesssim |D^2 \eta|H(\phi) + |\nabla \eta||H'(\phi)||\nabla \phi| + \eta|H''(\phi)||\nabla \phi|^2 + \eta|H'(\phi)||D^2 \phi|,
\]

and

\[
|\partial_t \varphi| \lesssim |\partial_t \eta|H(\phi) + \eta|H'(\phi)||\phi|, \quad H(\phi) \leq \phi, \quad \phi|H''(\phi)| \lesssim 1.
\]

Thus,

\[
\int_{\mathbb{R}^{N+1}} (|D^2 \varphi|^p + |\partial_t \varphi|^p) \, dx \, dt \lesssim \int_{\mathbb{R}^{N+1}} (|D^2 \phi|^p + |\nabla \phi|^p + |\phi|^p + |\partial_t \phi|^p) \, dx \, dt
\]

\[
+ \int_{\mathbb{R}^{N+1}} \frac{|\nabla \phi|^{2p}}{\phi^p} \, dx \, dt.
\]

This implies (5.6) since, according to [1], one has

\[
\int_{\mathbb{R}^N} \frac{|\nabla \phi(t)|^{2p}}{(\phi(t))^p} \, dx \lesssim \int_{\mathbb{R}^N} |D^2 \phi(t)|^p \, dx \quad \forall t \in \mathbb{R}.
\]

\[ \square \]
