HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
Goodness-of-fit tests based on \((h, \varphi)\)-divergences and entropy differences.

Abstract

We consider fitting uncategorical data to a parametric family of distributions by means of tests based on \((h, \varphi)\)-divergence estimates.

The class of \((h, \varphi)\)-divergences, introduced in Salicrú et al. (1993), includes the well-known classes of \(\varphi\)-divergences, of Bregman divergences and of distortion measures. The most classic are Kullback-Leibler, Rényi and Tsallis divergences. Most of \((h, \varphi)\)-divergences are associated to \((h, \varphi)\)-entropies under moment constraints are involved in numerous applications and are also of theoretic interest. Besides the family of exponential distributions maximizing Shannon entropy, see, e.g., Bercher (2014) for an overview of various information inequalities involving the so-called \(q\)-Gaussian distributions, i.e., distributions maximizing Rényi (or Tsallis) entropy under variance constraints.

For distributions maximizing Shannon or Rényi entropy under moment constraints, the related divergence is well known to reduce to an entropy difference. Then estimating divergence reduces to estimating entropy; see Girardin and Lequesne (2013a, 2013b).

A commonly used non-parametric procedure for estimating entropy is the nearest neighbors method; see Vasicek (1976) for Shannon entropy and Leonenko et al. (2008) for Rényi entropy. Vasicek (1976) deduced a test of normality whose statistics involves Shannon entropy difference, thus opening the way to numerous authors who adapted or extended the procedure to obtain goodness-of-fit tests for various sub-families of exponential distributions.

Recently, Girardin and Lequesne (2013b) considered goodness-of-fit tests for \(q\)-Gaussian distributions (among which the non-standard Student distribution arises as a meaningful example) based on Rényi’s divergence and entropy differences. Further, we will show how this methodology may extend to families of distributions maximizing other \((h, \varphi)\)-entropies.
