HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
1. What is GATB?

Motivation
NGS technologies produce terabytes of data. Efficient and fast NGS algorithms are essential to analyze them.

Objective
The Genome Assembly Tool Box (GATB)
- is an open-source software
- provides an easy way to develop efficient and fast NGS tools
- is based on data structure with a very low memory footprint
- allows complex genomes to be processed on desktop computers

Strength of GATB
GATB makes this graph compact by using a Bloom filter (a space efficient probabilistic data structure) and by using a CFP additional structure that avoids false positive answers from the Bloom filter due to its probabilistic nature.

3. Compact de Bruijn graph data structure

The core data structure of GATB is a de Bruijn graph that encodes the main information from the sequencing reads.

5. GATB helps you as a NGS user

GATB's de Bruijn graph: a basis for families of tools
- Data error correction
- Assembly
- Biological motif detection

Several tools based on GATB are already available
- Bloocoo: K-mer spectrum based read error corrector for large datasets
- Minia: Short read assembler based on a de Bruijn graph. Results are of similar contiguity and accuracy to other de Bruijn assemblers (e.g. Velvet)
- DiscoSNP: Discover Single Nucleotide Polymorphism (SNP) from non-assembled reads
- TakeARbreak: Detects inversion breakpoints without a reference genome by looking for fixed size topological patterns in the de Bruijn graph

6. GATB helps you as a NGS developer

The GATB C++ library gives you the opportunity to quickly develop new NGS tools that fit your needs.

Major facts about the GATB C++ library
- Object oriented design
- Simple and powerful de Bruijn graph API
- Simple and powerful multithreading model
- HDF5 usage for data storage
- Full Doxygen documentation including many code samples
- Test suite that checks the correct behavior of the library

License & Web Site

GATB is released under the GNU Affero General Public License. Proprietary licencing for software editors or services providers is currently being studied.

For more details on GATB:
http://gatb.inria.fr

Partners

GATB is developed by the following partners:
INRIA/IRISA/GenScale, Campus de Beaulieu, 35042 Rennes cedex
Department of Computer Science and Engineering, Pennsylvania State University, USA
