HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Investigation of nonlinear bulk viscoelasticity in complex media using dynamic acoustoelasticity

. Non-contact
. Acoustic rheology
. Nonlinear viscoelasticity

Introduction

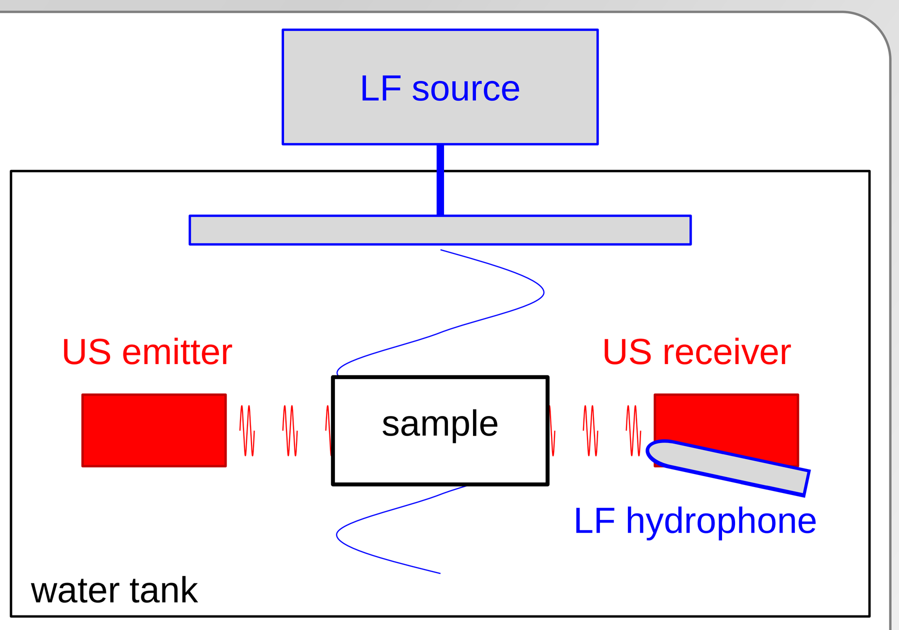
❖ Few tools have been developed for industrial quality control of textures. The use of non-contact techniques, based on acoustic waves, offers obvious advantages in food-processing or cosmetics industries : health & safety, non-destructive testing, continuous inline measurement.

❖ The Dynamic AcoustoElastic Testing (DAET) assesses the nonlinear viscoelastic properties of materials in response to a bulk compression/expansion stress. In this study, we present several applications of DAET method in complex media.

DAET method

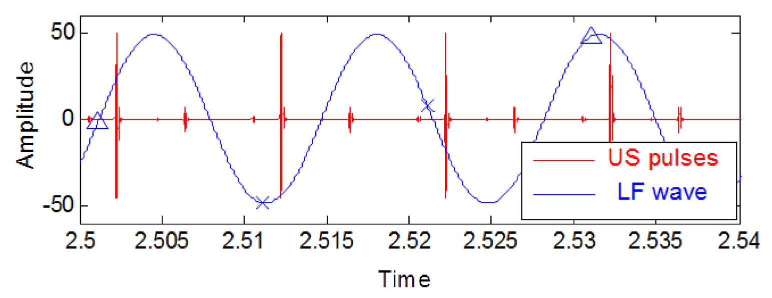
❖ Interaction between two acoustic waves :

- Low-frequency sinusoidal wave (LF, 4kHz) to successively compress and expand the medium,
- Ultrasound longitudinal pulses (US, 1 MHz) to probe this medium at different pressure values imposed by the LF wave.

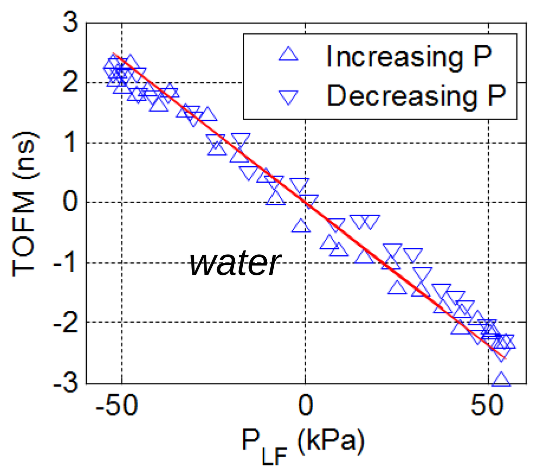


DAET synopsis

❖ Measurement of the Time of Flight Modulations (TOFM) of the US pulses, induced by the variations of the applied LF pressure: $TOFM = TOF_{P_{LF}} - TOF_0$



Acquired signals



❖ **DAET diagram:** plot of TOFM as a function of LF pressure

$$\Rightarrow TOFM^* \simeq -\frac{L}{c_0^2}\Delta c^* \simeq -\frac{L}{2\rho_0 c_0^3}\Delta M^*$$

with c the celerity, L the length propagation, ρ the density and **M*= ρc*²** the complex longitudinal modulus

Nonlinear viscoelastic parameters

❖ $M^* = A^* - B^*\varepsilon + C^*\frac{\varepsilon^2}{2} - ...$

$$\Rightarrow \Delta M^* = -B^*\varepsilon + C^*\frac{\varepsilon^2}{2} - ... \quad = -(B + j\omega\eta_B)\varepsilon + (C + j\omega\eta_C)\frac{\varepsilon^2}{2} - ...$$

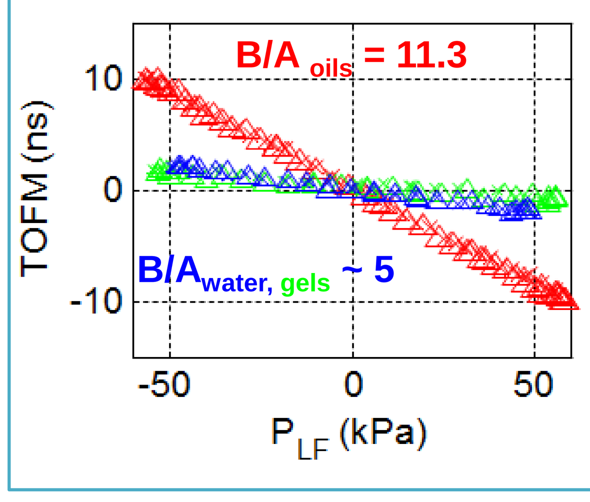
❖ From the measured TOFM, we identify nonlinear viscoelastic parameters:

$$TOFM = -\frac{L}{2\rho_0 c_0^3}\mathrm{Re}\left\{\left(\frac{B}{A} + j\frac{\omega\eta_B}{A}\right)\Delta P + \left(\frac{C}{A} + j\frac{\omega\eta_C}{A}\right)\frac{\Delta P^2}{2A}\right\}$$

Elastic parameters (B/A, C/A) Viscous parameters ($\omega\eta_B$/A, $\omega\eta_C$/A)

Validation in Fluids

HOMOGENEOUS MEDIA



Water, Carbomer gels, Silicon oils :

- Low values of B* ⇨ homogeneous media

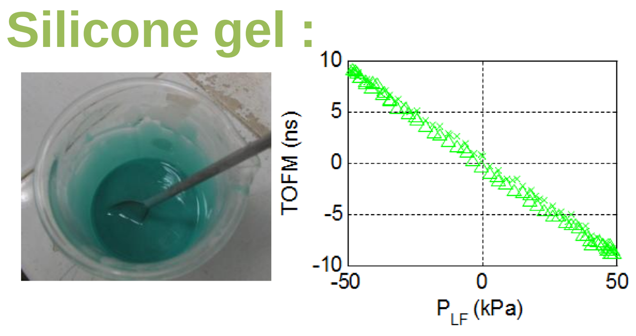
B/A	<15
$\omega\eta_B$/A	<1

- Governed by **fluid nature**

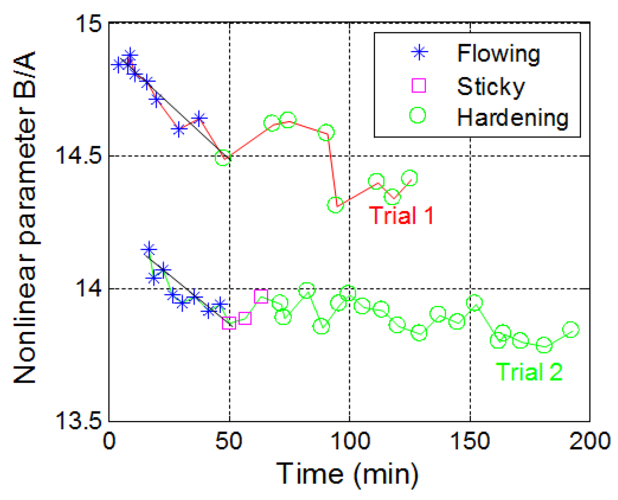
Results in Complex media

POLYMERIZATION

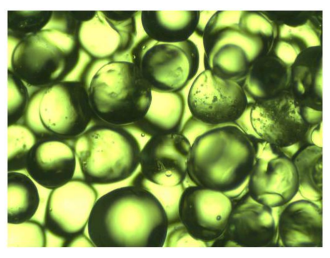
Silicone gel :



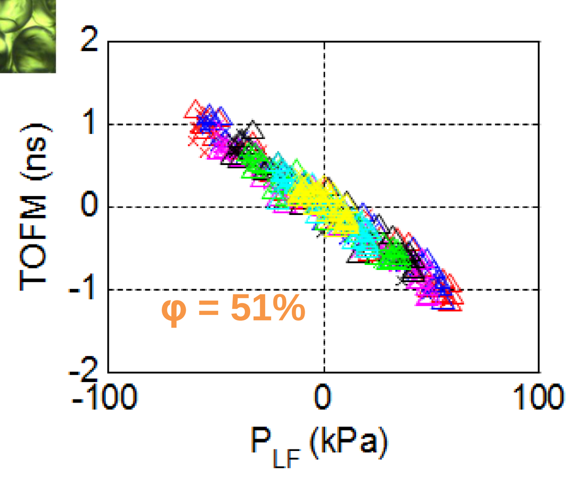
❖ **Silicon hardening kinetics** :
⇨ Gel time determination

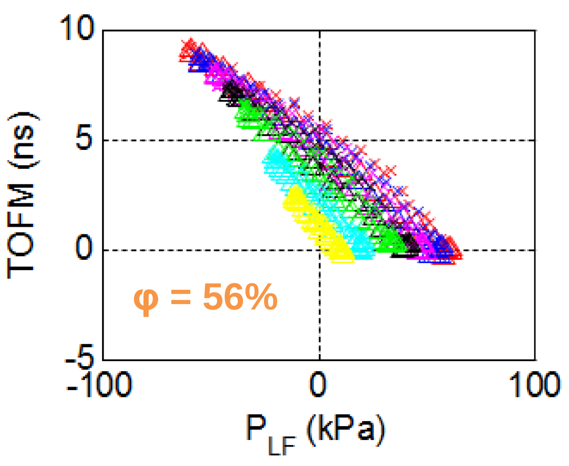


GRANULAR MEDIA



250 µm glass beads in gelatin :





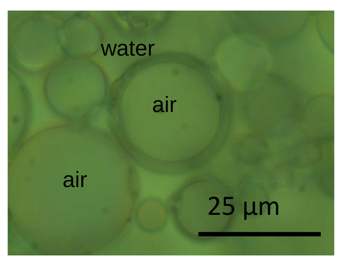
No beads contact (B*)	
B/A	12,2 ± 0,2
$\omega\eta_B$/A	-0,5 ± 0,7
Offset (ns)	0,0 ±0,1

⇨

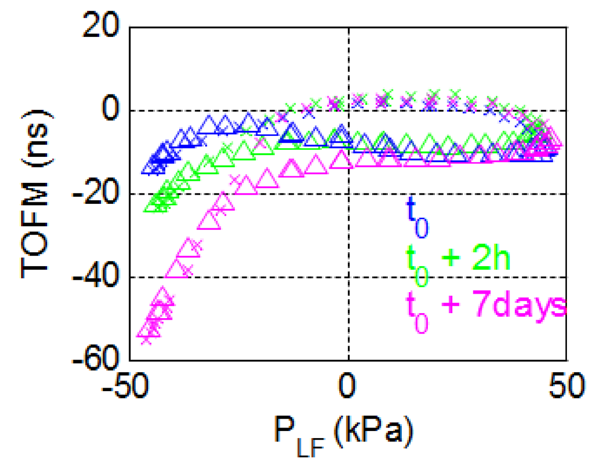
Beads contact (B*, C*)	
B/A	68 ± 13
$\omega\eta_B$/A	14 ± 3
C/A (x10⁶)	2 ± 1
Offset (ns)	3,9 ± 1,1

❖ Sensitivity to a **percolation threshold**

AIR-BASED MEDIA

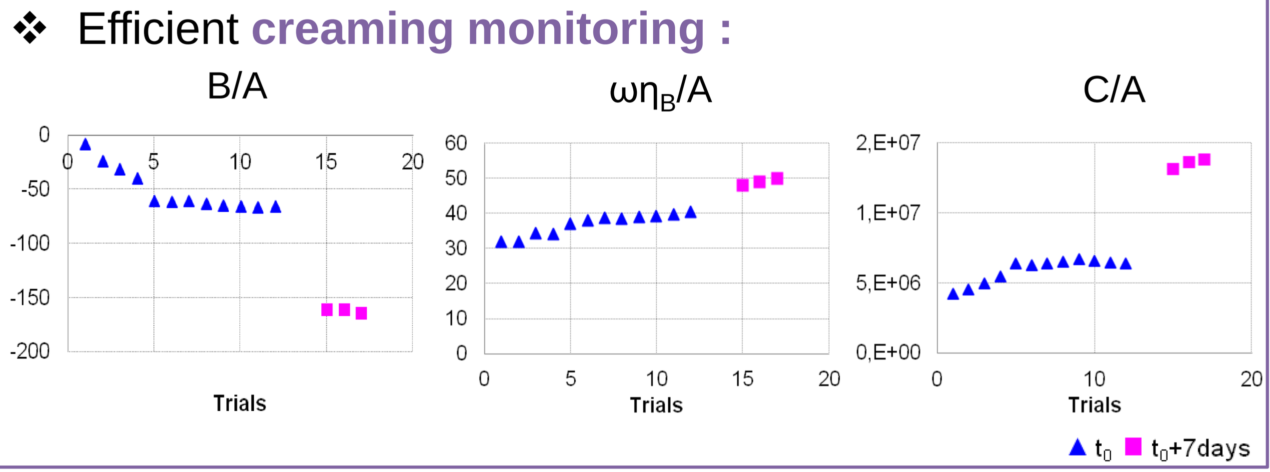


Hollow glass beads in water :



❖ High values of B*, C* and D*
⇨ air presence

❖ Efficient **creaming monitoring :**



Governed by **chemical bonds** Governed by **beads contact** Governed by **air and beads contact**

Conclusion and perspectives

❖ The DAET method measures with a good reproducibility the variations of the bulk viscoelastic modulus, through the quantification of nonlinear elastic and viscous parameters.

❖ Homogeneous fluids exhibit classical viscoelastic nonlinearities (1[rst] order B*) and complex media nonclassical viscoelastic nonlinearities (until 3 orders B*, C*, D*).

❖ This method appears to be an interesting alternative to conventional rheometry, especially for the characterization of these complex fluids.

❖ A similar work has to be done on the RAM data related to an attenuation of US pulses (thanks to a nonlinear Kramers-Kronig relationship ?…)
