

# A Spatial Data Infrastructure dedicated to scientific research and observation of the coastal environment

http://indigeo.fr

Mathias ROUAN

- Research Engineer -

UMR 6554 LETG CNRS

Littoral, Environment, Remote sensing and Geomatics

Context Feature	Original features	Demonstration	Contents	Conclusion	Prospects
-----------------	-------------------	---------------	----------	------------	-----------

#### In 1996:

The multi-site LETG research unit of the CNRS is created (4 cities in the West of France)

#### In 1998:

- European **Aarhus Convention** recommending the free circulation of the environmental data
- Implication of LETG in the observatory of the IUEM (European Institute for Marine Studies through the implementation of the SIEC (Information System for Coastal Environment)

#### In 2003:

- Standardization : **ISO 19115 standard** for geographic information metadata
- Interdisciplinary program " information society " of the CNRS
- Development of MEnIr: Iroise Sea Environmental Memory

Context Features	Original features	Demonstration	Contents	Conclusion	Prospects
------------------	-------------------	---------------	----------	------------	-----------

#### From 2005 to 2007:

- Awareness of the utility of cataloging
- Development of our expertise (CIAO MDWeb in partnership with the UICN)
- IUEM becomes a certified monitoring center (OSU)
- Increase of the observation data series of the coastal environment

#### In 2007:

**INSPIRE (European directive 2007/2/EC)** establishing an infrastructure for spatial information in Europe to support Community environmental policies, and policies or activities which may have an impact on the environment

#### In 2009:

Project of implementation of a federative and interoperable data portal

Context	Features	Original features	Demonstration	Contents	Conclusion	Prospects
---------	----------	-------------------	---------------	----------	------------	-----------

#### From 2009 to 2011:

A series of seminars and training initiatives around the digital management of the observation data of the coastal environment

#### In 2011:

A workgroup "geographical databases" is set up in the West of France

#### In 2012:

Common project between the LETG Unit and the Rennes and Brest Observatories with a strong financial and human investment

**Equipment**: 17 000€

Software (installation, configuration, training and specific developments): 20 000€

**<u>Human resource</u>**: 2 full-time equivalent engineers

Conclusion

**Prospects** 

An SDI allowing the cataloguing, the storage and the distribution of the geographical information produced within the framework of scientific research and observation works led by the UMR LETG and the OSU observatories (Rennes, Brest, Nantes).

Consists of a metadata catalog and a georeferenced data server backed by a web portal with a viewer.

The deployed solution is based on geOrchestra free tools (geonetwork, geoserver, openlayers...) an initiative of géoBretagne (a French regional SDI)

Context F

**Features** 

**Original features** 

**Demonstration** 

Contents

Conclusion

**Prospects** 

This infrastructure is interoperable with other regional, national and scientific SDI through the use of OGC standards (WMS, WFS, CSW)

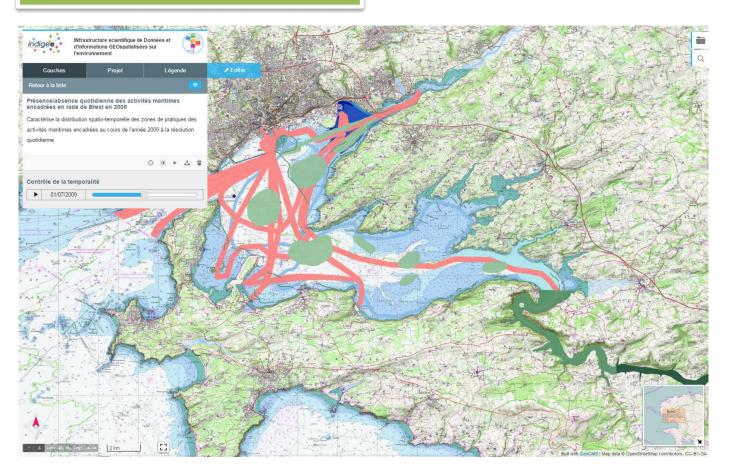

It also benefits from the additional development of an ergonomic and scalable viewer (GeoCMS\*) to meet the specific needs of scientific data (temporal series, spatiotemporal data) and so bring them to knowledge and make it available according to the INSPIRE Directive.

#### PROJETS / PÔLE IMAGE

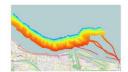

(La Réunion)

MNT à 10 cm de résolution généré à partir d'un nuage de points 3D acquis par Scanner Laser Terrestre (Terrestrial Laser Scan TLS) de 2011 à 2013

Site de Porsmilin

Mesures de la bathymétrie et de l'altimétrie sur la plage de Porsmilin (Finistère)

Levés SMF et LIDAR de la rivières des pluies, Île de la Réunion

Levés SMF des canyons sous-marins à l'embouchure de la rivière des Galets et MNT à 20 cm de résolution, effectué avec des données TLS (Terrestrial Laser Scan)

Suivi géomorphologique de la plage du Vougot (Guissény)

Bathymétrie, profils de plage et suivi du trait de côte sur le site du Vougot (Guissény, Finistère)

Série d'ortho images - rivière Vieux Habitant de 2007 à 2013

Ortho Images d'un méandre de la rivière de Vieux Habitants au lieu dit "Crash Zone" calculée à partir d'images Drone

Levés SMF à la Guadeloupe

Mesures bathymétriques au sondeur multifaisceaux réalisées à l'hiver 2011 autour des îles de Guadeloupe

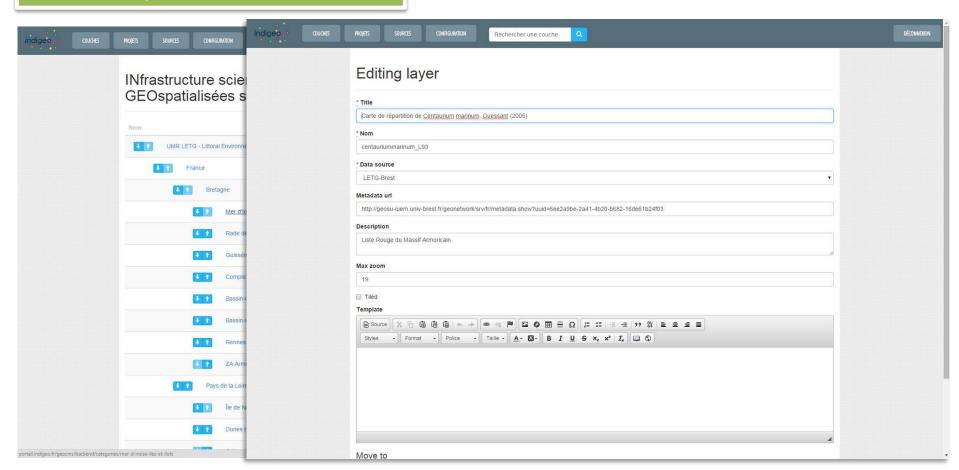

Levés SMF et LIDAR de la rivières des galets, Île de la Réunion

Levés SMF des canyons sous-marins à l'embouchure de la rivière des Galets et MNT à 20 cm de résolution, effectué avec des données TLS (Terrestrial Laser Scan)

indigeo, qui en latin signifie "avoir besoin de...", est une Infrastructure de Données Géographique (IDG) dédiée à la recherche et l'observation scientifique de l'environnement dans l'ouest.

Elle est à l'initiative de l'Unité Mixte de Recherche LETG du CNRS et s'appuie sur l'Observatoire des Sciences de l'Univers de Brest (IUEM) et la Zone Atelier Brest-Iroise.

Elle est constituée d'un catalogue de métadonnées et d'un serveur de données géospatialisées adossés à un visualiseur cartographique.

- ➤ About 15 interoperable SDI harvested: IGN, SHOM, SEXTANT, BRGM, MNHM... representing about 6000 data available

2 other thematic portals hosted

Context	Features	Original features	Demonstration	Contents	Conclusion	Prospects
---------	----------	-------------------	---------------	----------	------------	-----------

#### **Strengths:**

- Technology based on independent tools (geonetwork, geoserver, geocms, managechart)
- Interoperability through the use of international standards (ISO191xx, OGC)
- Ergonomic and adaptable platform
- Active community for geOrchestra

#### **Limits:**

- Shy supply of the catalog:
  - Concern about the availability of data
  - Limited interest of the community
  - Establishment of a training plan
- Lack of availability and skills of multipliers in units
- Small (but growing) community for geoCMS

Context	Features	Original features	Demonstration	Contents	Conclusion	Prospects
---------	----------	-------------------	---------------	----------	------------	-----------

#### Governance

- Establishment of a western SDI steering committee (indigeo, osuris, geoSAS)
- Develop the interactions with other SDI and Long-Term Ecological Research Networks

#### Skills transfer

- Establishment of a two-level training plan:
  - Users level (research staff) -> metadata party (December 2013)
  - Professional level (multipliers in teams)

### **Developments**

- Standardization of time series and sensor data (SOS / SWE)
- Web Processing Service (geomorphological data series treatments scripts)
- Adding web analytics trackers to analyze the use of the platform
- Identity federation authentication
- Online help (guided tour)
