GHG balance, livestock production

	GHG emissions (CO ₂ eq)	
	10 ⁹ tonnes	%
Land use, land use change	2.5	36
Feed production	0.4	7
Enteric fermentation, energy	1.9	25
Manure management	2.2	31
Processing, transport	0.03	1

N surplus: an indicator of GHG emissions

- and therefore
improving N use efficiency is
a strategy for GHG mitigation

Outline

- › Diversity of livestock production and manure management
- › Sources of CH_4 and N_2O in manure environments
- › Mitigation measures and strategies
- › Quantifying effects of mitigation
- › Global trends, conclusions

Diversity of livestock production

Case: Sub-Saharan Africa

by dd

Blanchard (2010)	Area	Farms
	ha	%
Crop production w. livestock	5-11	68
Livestock, grazing	11-24	30
Specialist breeders	<1	2

Diversity of livestock production

Case: Sub-Saharan Africa

ANIMAL AGRICULTURE
CONCENTRATING ON ANIMALS WITH HIGH POTENTIAL

Diversity of livestock production

Case: Southeast Asia

Vietnam:
23,000,000
pigs (2004)

Discharge 9-15% of N intake

Vietnam
China

110,000 digesters
30,000,000 digesters

Leakage losses of CH_4 ?¹⁰

Diversity of livestock production

Case: China

Proportion of confined animal feeding operations is increasing

(MOA, 2010)

Diversity of livestock production

Case: China

- › Increase manure treatment to stabilise nutrients
- › Account for manure N fertiliser value
- › Reduce N application rates

(MOA, 2010)

Diversity of livestock production

Case: European Union

Increasing adoption of regulations to reduce N surplus and GHG emissions:

- › Manure storage capacity
- › Manure storage conditions
- › Limits to N application rates
- › Assign manure N fertiliser value

Diversity of livestock production

Case: European Union

More confinement, higher productivity

Livestock production systems (solid → liquid)

Manure storage (aerobic → anaerobic)

Regulation of CH_4 and N_2O emissions in manure environments?

Methane emissions from (liquid) manure

IPCC: Temperature a key control of manure CH₄ emissions

TABLE 10.17 MCF VALUES BY TEMPERATURE FOR MANURE MANAGEMENT SYSTEMS																				
System ^a		MCFs by average annual temperature (°C)																		
		Cool					Temperate											Warm		
		≤ 10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	≥ 28
Liquid/Slurry	With natural crust cover	10%	11%	13%	14%	15%	17%	18%	20%	22%	24%	26%	29%	31%	34%	37%	41%	44%	48%	50%
	Without natural crust cover	17%	19%	20%	22%	25%	27%	29%	32%	35%	39%	42%	46%	50%	55%	60%	65%	71%	78%	80%

Methane emissions

Role of methanogens?

>3 months old cattle slurry

Elsgaard et al. (unpubl.)

- pig slurry storage, age <1 to >6 months
- pig house, age <1 month

Petersen et al. (subm.)

Methane emissions

Role of methanogens?

Hydrogenotrophs

Acetotrophs,
methylophs

>3 months old cattle slurry

Elsgaard et al. (unpubl.)

Methane emissions

Potential CH₄ mitigation strategies

Reduce CH₄ production by:

- › Lower storage temperature
- › Avoid mixing with adapted slurry
- › Remove volatile solids
- › Additives to inhibit methanogens

Nitrous oxide emissions

Via nitrification

AOB - Ammonia oxidizing bacteria

NOB - Nitrite oxidizing bacteria

	AOB	NOB
	<i>Nitrosomonas</i> sp.	<i>Nitrobacter</i> sp.
Oxygen affinity, K_m (kPa)	5-15	22-108
NH_3 (free) (mg N L^{-1})	10-150	0.1-1.0
HNO_2 (free) (mg N L^{-1})	0.1-0.4	0.011-0.023

Nitrous oxide emissions

Via nitrification

AOB - Ammonia oxidizing bacteria

NOB - Nitrite oxidizing bacteria

	AOB	NOB
	<i>Nitrosomonas</i> sp.	<i>Nitrobacter</i> sp.
Oxygen affinity, K_m (kPa)	5-15	22-108
NH_3 (free) (mg N L^{-1})	10-150	0.1-1.0
HNO_2 (free) (mg N L^{-1})	0.1-0.4	0.011-0.023

Nitrous oxide emissions Via denitrification

Nitrous oxide emissions

Potential N₂O mitigation strategies

Reduce N₂O emissions by:

- › Minimising the extent of oxic-anoxic interfaces
(oxic or anoxic)
- › Uncoupling C and N turnover
(treatment before storage)

Mitigation measures

Treatment effects

Petersen et al. (in prep.)

After 24 h:

Thomsen et al. (2010)

Mitigation measures

Field application

- › Application method
- › Application rate
- › Timing

(soil-manure contact)

(avoid large pools of mineral N)

(mineral N residence time)

Soil type
Soil wetness
Tillage practice

Strategies for GHG mitigation

The “manure management continuum”

Example:

Three diets (early grass, late grass, maize) w/wo rapeseed

Strategies for GHG mitigation

The “manure management continuum”

β_0 (faeces)
MCF = 10%

Evaluating GHG mitigation
requires a whole-farm approach

GHG mitigation at farm level

Criteria for evaluating farm models

- › Ability to simulate temporal, spatial, genetic variability, and farmer decision making
- › Coupling of nutrient, water, energy flows
- › Economy
- › Uncertainties

Data availability for parameterisation

- 1) Temperature;
- 2) O₂ status;
- 3) Manure handling/treatment/application

Global trends

Livestock populations, by region

Growth mainly in developing countries

At least 75% of the growth in confined systems (FAO scenario)

How to achieve sustainable intensification?

How to achieve sustainable intensification?

Subsistence agriculture

- › Containment of manure nutrients during storage
- › Recycling of manure nutrients for crop production
- › Increasing market orientation

How to achieve sustainable intensification?

Mixed farms > farms specialised in crops or livestock

- › Less external inputs (fertilisers, feed)
- › Lower costs
- › Diversification = less sensitivity to fluctuating prices
- › Lower risk of N pollution
- › Greater biodiversity

How to achieve sustainable intensification?

Industrialised production systems

- › Recycling rather than discharge of manure nutrients
- › Treatment technologies
- › Need for regulation/incentives

(Kyllingsbæk and Hansen, 2007)

Conclusions

- › Treatment and management to improve N use efficiency will also promote GHG mitigation
- › Higher N use efficiency can improve farm profitability while also reducing GHG emissions per unit product
- › Future increases in livestock production mainly in confinement systems – effective recycling of nutrients should be ensured via regulations/incentives
- › A whole-farm approach is needed to identify cost-effective GHG mitigation measures
