HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Dynamics of Cl + propane, butanes revisited: a crossed-beam slice imaging study

Baptiste Joalland, Yuanyuan Shi, Nitin Patel, Richard Van Camp and Arthur G. Suits

By taking advantage of an improved atomic chlorine source, we have measured velocity–contour flux maps of H–D abstractions in the reactions of chlorine with selected alkanes at an unprecedented level of detail. Angular and reduced translational energy distributions for the set of studied alkanes, namely propane, its two selectively labeled isotopologues $\text{CD}_3\text{CH}_2\text{CD}_3$ and $\text{CH}_3\text{CD}_2\text{CH}_3$, and butane isomers n-butane and isobutane for which none or only interpolated differential cross sections were measured in the past, show distinct differences that allow us to revisit the “reaction picture” of this family of reactions.

Experimental

Crossed-beam DC slice imaging set-up

A high-density Cl source: photolysis/ablation

Advantages:

- Enhanced S/N ratio => Unfocused probe
- Probe/interaction region overlap
- Little density-to-flux correction
- No multiple photon ionization
- => **Product selection with ionization energies**

Thermochemical data

Reactant	Product	RDE (kcal mol ⁻¹)	ΔH(0 K) (kcal mol ⁻¹)	Vertical IE (eV)	Adiabatic IE (eV)
Propane D1, D2	n-Propyl				
	$\text{CH}_3\text{CH}_2\text{CH}_2\cdot$	100.6	-2.8	8.40	7.66
	$\text{CD}_3\text{CH}_2\text{CH}_2\cdot$	103.1	-3.3	8.41	7.68
	$\text{CH}_3\text{CH}_2\text{CD}_2\cdot$	100.6	-2.8	8.43	7.64
	Isopropyl	97.0	-6.4	7.74	7.47
	$\text{CD}_3\text{CH}(\text{CD}_3)\cdot$	97.3	-6.1	7.75	7.48
n-Butane	$\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\cdot$	100.5	-3.0	8.32	7.51
	2-Butyl	97.3	-6.1	7.67	7.32
	2-Methylene-propane	100.6	-2.8	8.33	6.64
Isobutane	Isobutyl	95.3	-8.1	7.22	6.87
	$(\text{CH}_3)_2\text{CH}\cdot$				

- Bond dissociation energies (BDEs) and reaction enthalpies at 0 K (DH(0 K)) for all the possible H–D abstractions, and adiabatic and vertical energies of the corresponding products.
- Values calculated at the CBS-QB3 level of theory.

=> **Velocity-flux maps measured for secondary H(D) abstractions in propane and n-butane, and tertiary H abstraction in isobutane.**

Imaging

DC sliced raw images of reactive scattering and nominal Newton diagrams for the reactions of chlorine with propane and butane: (a) propane, $E_c = 11.6 \text{ kcal.mol}^{-1}$ (b) propane D2, probe at $m/z = 49$ (CD_3CHCD_3) $E_c = 11.8 \text{ kcal.mol}^{-1}$, (c) propane D2, probe at $m/z = 46$, ($\text{CH}_3\text{CD}_2\text{CH}_3$) $E_c = 12.1 \text{ kcal.mol}^{-1}$, (d) n-butane, probe at $m/z = 57$, $E_c = 13.4 \text{ kcal.mol}^{-1}$, and (e) isobutane, probe at $m/z = 57$, $E_c = 13.6 \text{ kcal.mol}^{-1}$. All images are shown after background subtraction and density-to-flux correction.

Differential Cross Sections

- Reduced translational energy distributions for forward (30–60 deg.), sideways (60–120 deg.), and backward (120–180 deg.) scattered products and the center-of-mass angular distributions.
- Top panel corresponds to propane reactions. Bottom panel corresponds to butane reactions.
- Each distribution is normalized to its backward component that dominates the translational energy distributions of all the systems in this range of integrated angles.

- Left: Reduced translational energy distributions for 10 deg. steps of the angular distributions of reactions of chlorine with n-butane and isobutane.
- Right: Fractions f_c and f_{av} of collision energy E_c and available energy E_{av} , respectively.

Conclusions

Propane and isotopologues:

- Concerning translational energy recoil, FW and SW $\text{CD}_3\text{CH}_2\text{CD}_3$ distributions peak at lower E_T^* than regular propane and $\text{CH}_3\text{CD}_2\text{CH}_3$, while all FW distributions peak at similar E_T^* , reflecting a more effective energy disposal into the CD_3CHCD_3 propyl degrees of freedom for the “rebound-like” mechanism.

=> **the role of vibrational excitation of the propyl product**

- The angular distribution of D2 is affected by the deuteration.

=> **a kinematic effect**

Butane isomers:

Compared to n-butane distributions, isobutane distributions exhibit a more sharply peaked angular distribution with a broader translational energy distribution in the FW direction, even possibly a bimodal distribution.

=> **vibrationally excited HCl or steric hindrance effect?**

=> Need for state-resolved experiments
