KEYWORDS: *pyrido[3,2g]quinolines, diazaanthracenes, aromatic amino acids, foldamers*

ABSTRACT: The synthesis of a variety of 9-functionalized 1,8-diazaanthracene diesters and amino acids is described. Derivatization in the 9-position relies on facile reactions performed on the 9-chloro and 9-bromomethyl precursors. This has allowed the incorporation of nucleophilic or sensitive functional groups that otherwise cannot be incorporated under standard methods for synthesizing these compounds. Additionally, the synthesis of the protected amino acids via a high yielding monosaponification and subsequent Curtius rearrangement has been accomplished on multi-gram scale. These units, together with the functionalized derivatives should prove to be useful monomers in the synthesis of aromatic oligoamide foldamers.

Introduction

The last decade has seen a significant advancement in the synthesis of molecules designed to mimic both structural and functional aspects of biopolymers.^{1,2} Chemists can now readily synthesize oligomeric or even polymeric systems that, through the same principles that direct folding in biological molecules, adopt complex secondary structural features including helices, linear strands and, more rarely, sheets.³⁻⁸ These artificial folded molecular architectures, termed foldamers,⁹ are typically comprised of small distinct units that, when connected together, self-organize into specifically shaped macromolecules, the properties of which are dependent on the composition of monomers used. In this respect, the development of new foldamers can be said to be monomer driven. Thus, the synthesis of novel monomer units is an important endeavor for expanding the diversity of this class of molecules.

While the majority of synthetic foldamers make use of aliphatic units derived from α -amino acids or the homologous β - and γ -amino acids,¹⁰⁻¹² the myriad of chemical building blocks afforded to chemists has given rise to folded systems more distinctly removed from their natural counterparts. These include, but are not limited to, oligomers comprised of *m*-phenylene ethynylenes,^{13,14} pyridine-pyridazines,^{15,16} ureas,^{17,18} and aromatic amides.^{19,20} This last group, aromatic oligoamide foldamers, has shown particular promise in the development of complex architectures as a result of their high predictability, stability, and tunability.

The connection of aromatic rings via an amide linkage gives a planar or close to planar system as a result of conjugation.

Thus, with a functionalized aromatic ring, one of two conformations can be expected, with the preference for *syn* versus *anti* dictated by the local attractive and repulsive electrostatic interactions between the amide and any endo- or exocyclic heteroatoms on the ring, (Figure 1a).^{19,20} Extension of these principles to subsequent monomers consequently results in an overall structure that is defined by the collection of local conformational preferences. In the case of helical structures, where these preferences bring the additional monomers around in a full turn, steric interactions result in the strand being twisted out of planarity and the secondary structure that begins to form being further stabilized by aromatic π - π stacking interactions.

Monomers for these designs, (Figure 1b, c), as long as they fulfill the structural requirements described above, can be readily modified to tune many of the properties of the foldamers including solubility, curvature, or aggregative tendencies. Specifically, by tuning the width of the monomers in a sequence and the angle between their amino and carboxy groups, large cavities capable of encapsulating guest molecules can be developed. Several such systems based on aromatic oligoamides have now been reported.²¹⁻²⁶ However, current limitations on these systems involve both limited cavity sizes and limited functional group diversity on the interior surfaces.

Pyrido-[3,2-g]quinolines, hereafter referred to as 1,8-diazaanthracenes in this manuscript (Figure 1c), represent an attractive candidate for expanding both the size and interior complexity of such helical receptors. These units offer a long

distance (~ 9 Å) and wide angle ($\sim 120^\circ$) between connection sites at positions 2 and 7, which can allow interior cavities of exceptionally large size to be synthesized. Additionally, because only the outer two aromatic rings are used for structural stability by means of their endocyclic nitrogen atom, the central ring, i.e. position 9, can be modified in order to potentially provide enhanced interactions between the host and guest molecules or even provide catalytic sites through the use of functional groups that converge towards the interior of a helical cavity, (Figure 1d). As a class of molecules, 1,8-diazaanthracenes have been studied for both their photophysical and pharmaceutical applications.²⁷⁻³⁰ Despite this, the variety of such compounds is not extensive, and while units of this type have been used in the development of helical aromatic oligoamides,^{24-26,31-34} their diversity has been limited to the two units shown in Figure 1c.

Figure 1. (a) Conformational exchange between *syn* and *anti* forms of an aromatic amide. (b, c) Examples of aromatic building blocks for aromatic oligoamides, including 1,8-diazaanthracenes (c) that have been used for foldamer synthesis. (d) Potential ways for using 1,8-diazaanthracenes for arranging convergent functional groups in a helical foldamer scaffolds

Scheme 1. Typical synthesis of 1,8-diazaanthracenes^a

^aReaction conditions: (a) dimethyl acetylenedicarboxylate, MeOH; (b) Ph₂O, Δ ; (c) diisopropyl azodicarboxylate, PPh₃, ROH, THF

The typical synthetic route to make these molecules likely contributes to this limited diversity (Scheme 1). The synthesis is accomplished via an initial Michael addition of two equivalents of dimethyl acetylenedicarboxylate to the appropriate 1-functionalized-2,6-diaminobenzene.²⁷ Thermal cyclization in refluxing diphenyl ether at 260°C and then alkylation of the resulting 4,5-dihydroxy-1,8-diazaanthracenes under Mitsunobu conditions gives the final monomers.^{23,26,33} Through this protocol, variation of the 9-position substituent is limited to the range of functional groups that can be incorporated into the starting diaminobenzene moiety and that are capable of withstanding the harsh conditions of the cyclization step, i.e. either high temperature,²⁷ or strongly acidic conditions.³⁵ In addition, this route requires a substituent on the diamino-benzene precursor, and does not allow to directly reach the 9-H 1,8-diazaanthracene. Without this substituent, a 1,7-phenanthroline is obtained instead of a 1,8-diazaanthracene.^{27,36}

For modification of the 9-position, it would be ideal to have monomers that could be readily modified after their initial synthesis. The current work provides methods for easily introducing a number of aromatic and alkyl functional groups at the 9-position of the diazaanthracene monomers. Furthermore, because functionalization takes place after the cyclization step, previously unobtainable monomers, such as the 9-hydro derivative, are now accessible.^{27,36}

Additionally, the synthetic route affords symmetrical units having ester functional groups both in the 2- and 7- positions. This has until now hampered the production of multimeric segments of 1,8-diazaanthracene units, their development being limited to the use of less stable connections such as anhydrides.³³ In order to increase the applicability of these units in the synthesis of aromatic oligoamides, two methods for the desymmetrization of the monomers and formation of the amino acids are reported here. Through these synthetic routes, a novel class of large aromatic amino acids with a variety of side-chains has been obtained.

Results and Discussion

Derivatization of the 9-position of the diazaanthracenes.

As shown in Scheme 2, the starting materials for diversification of the diazaanthracene series are the 9-methyl³⁴ (compound **1**) and 9-chloro (compound **2-Cl**) derivatives, both readily obtained from reaction of the corresponding pyridoquinolinone with isobutyl alcohol under Mitsunobu conditions. Compound **1** can be brominated in the benzylic position using N-bromosuccinimide and benzoyl peroxide to give compound **1-Br** in good yield (89 %). Subsequent substitution of the bromide by reaction of Ag₂CO₃, AgOAc, or AgONO₂ gave the derivatives **1-OH**, **1-OAc**, and **1-ONO₂** respectively. Interestingly, while both the acetate and nitrate ester groups were initially planned as methods for getting to the alcohol, the nitrate ester proved resistant to hydrolysis by water and attempted transesterification of the acetate derivative by methanol in the presence of catalytic sulfuric acid instead resulted in the formation of the methyl ether derivative **1-OMe**. The nitrate ester, however, appears to be a reasonable precursor for synthesis of the aldehyde derivative, **1=O**, by reaction with multiple equivalents of Et₃N in refluxing dimethoxyethane.

Nitrogen containing side chains are similarly incorporated. The reaction of five equivalents of sodium azide with **1-Br** in the presence of 15-crown-5 proceeds at room temperature to give **1-N₃** in good yield. However, attempted reduction of the azide to the amine did not give good conversion by either

standard reduction with Pd/C and H₂ or by Staudinger reduction using PPh₃. Instead a Gabriel type synthesis of the amine was used by initially substituting **1-Br** with di-*tert*-butylimidocarbonate to give the bis(*tert*-butoxycarbonyl) protected benzylic amine.³⁷ Selective mono-Boc deprotection using Mg(ClO₄)₂ in refluxing MeCN gave derivative **1-NHBoc** in 80% yield across the two steps.

Scheme 2. Derivatization of diazaanthracene units.^a

^aReaction conditions: (a) NBS, BPO, C₆H₆, 60°C, 89%; (b) Ag₂CO₃, dioxane/H₂O, Δ, 80%; (c) AgOAc, dioxane, 91%; (d) AgONO₂, dioxane, 81%; (e) 1.1. AgOAc, dioxane; 1.2. MeOH, H₂SO₄ cat. 80%; (f) AgONO₂, dioxane, then Et₃N, dioxane, Δ, 41%; (g) NaN₃, 15-crown-5, dioxane, 71% (h) 1.1. KNBoc₂, DMF, 50 °C; 1.2. Mg(ClO₄)₂, MeCN, Δ, 80%; (i) Methylimidazole, Δ, 83%; (j) NaN₃, PPh₃, DMF, Δ, 61%; (k) NaN₃, PPh₃, DMF, Δ, then Boc₂O, DMAP, dioxane, Δ, 80%; (l) HSBn, Cs₂CO₃, toluene 86%; (m) Pd/C, H₂, K₂CO₃, DMF, 79%; (n) C/O₂, toluene, 100 °C 83%.

Cationic nitrogen centers could also be generated quite readily. Reaction of N-methylimidazole with **1-Br** gave the imidazolium salt, **1-imid**, in 83% yield after precipitation in diethyl ether. In addition to the positive charge that it can provide, this derivative could also provide carbene based reactivity inside of a foldamer capsule.

Compound **2-Cl** could similarly be derivatized through nucleophilic displacement of the chloride. Sulfur based nucleophiles readily add to the diazaanthracene. Even at room temperature, the reaction of benzyl mercaptan with **2-Cl** in the presence of Cs₂CO₃ proceeds to give **2-SBn** as a bright red solid in 86% yield.

In order to obtain the 9-amino derivative **2-NH₂**, it was envisaged that reaction with NaN₃ in DMF would give an intermediate azide bearing diazaanthracene that could be reduced to give the amine. However, at the temperatures required for substitution to occur, the resulting azide decomposed, presumably to the nitrene and gave a mixture of species including the amine, in low yield (<30 %), as well as an unstable species assigned to the 9-azido complex based on a strong IR signal at 2116 cm⁻¹ (KBr pellet), and several unidentified species attributed to decomposition products resulting from side reactions with the nitrene intermediate. By combining the displacement and reductive steps through the addition of PPh₃ to the reaction mixture, as described by Kandakar et al.,³⁸ the yield could be greatly increased (61 %) and the amine obtained as a bright red crystalline solid after work-up.

Protection of **2-NH₂** by reaction with Boc₂O proceeds only at high temperatures and with the addition of DMAP. Under these conditions, the reaction cannot be stopped at the mono-Boc complex. Rather, even when the reaction is stopped before completion, only starting material and the di-Boc complex **2-NBoc₂** are observed.

Most importantly for complex **2-Cl**, it provides a method for the synthesis of the 9-hydro compound, **2**, an ideal unit for designing large cavities because of its lack of space filling functional groups. Hydrodehalogenation of **2-Cl** occurs readily in DMF with K₂CO₃ as a base. The use of a weaker base like Et₃N or less polar solvent does not give the desired hydrodehalogenation, rather the major product is a 1,2,3,4-tetrahydropyrido[3,2g]quinoline species, **2-Cl^{red}** (Figure 2c), resulting from reduction of one of the pyridine rings. Even under the ideal conditions the initial product from the hydrodehalogenation, the 9-hydro compound **2** is further reduced to the 9,10-dihydro compound **2-H₂**. Despite best efforts to stop the reaction before the second reduction occurs, a mixture of both products was always obtained. Compound **2-H₂** can however, be reoxidized back to the fully aromatic **2**.

While several conditions for the reoxidation were tested including MnO₂, DDQ, and Pd/C under N₂, the best results were obtained from activated C and O₂³⁹ in refluxing toluene. Reaction progress was monitored by ¹H-NMR through loss of the triplet signals at 4.53 and 4.07 ppm and the appearance of two singlets at 9.29 and 9.20 ppm consistent with the oxidation of the central ring. The combined yield for both the reduction and reoxidation steps is close to 66% and compound **2** can be obtained in multi-gram quantities. The lack of a functional group in the 9 position now allows other derivatives to be synthesized through electrophilic aromatic reactions. As one example, **2** was converted into the 9-bromo compound **2-Br** through reaction with NBS at elevated temperature.

Compounds **2**, **2-H₂**, and the byproduct with the reduced pyridine ring were all characterized by X-ray crystallography, (Figure 2). While the byproduct, (Figure 2c), shows significant differences from either **2** or **2-H₂**, the latter compounds are very similar in structure with the central ring of **2-H₂** showing only minor distortion into a chair conformation. The change in C-C bond lengths between the 9 or 10 position carbons and the adjacent pyridine rings, 1.49 Å in **2-H₂** to 1.40 Å in **2**, is nevertheless consistent with the different degrees of saturation in the central ring.

Desymmetrization and Amino Acid Synthesis.

As stated earlier, for the facile synthesis of diazaanthracene oligoamide segments, it would be ideal to develop amino acid

derivatives. This involves two important steps; the first is the desymmetrization by monosaponification of the equivalent diesters and the second is the conversion of the resulting acid into the protected amine functionality. As shown in Scheme 3, the synthetic approach is different depending on the starting compound.

Figure 2. Top (left) and side (right) views of ball and stick representations of the X-ray crystal structures of (a) **2**, (b) **2-H₂**, and (c) the tetrahydropyrido[3,2g]quinoline byproduct (**2-Cl^{red}**) from failed hydrodehalogenation attempts. Protons and included solvent molecules have been removed and, in the top view, isobutoxy side chains have been shortened for clarity

Figure 3. Ball and Stick representation of the X-ray crystal structures of dimeric byproduct **4-dimer**. Protons and included solvent molecules have been removed and isobutoxy side chains shortened for clarity.

For both **1** and **2**, high yields in the monosaponification step rely on the limited solubility of the monocarboxylate salt. With **1**, it was found that a solvent mixture of 75/25 THF/MeOH and NaOH as the base, gave **3-Me** in the best yields, while for **2**, initial solvation in hot methanol followed by the addition of KOH afforded **3** in 90% yield after a short reaction time at 60 °C followed by reaction overnight at 35 °C. For both compounds the carboxylate salt precipitates out and can be isolated in pure form by filtration. For **3-Me**, the compound was left as the sodium salt and used this way for subsequent steps, while for **3**, the product was washed with a citric acid solution to obtain the acid. Compound **3-Me** was convert-

ed into the Boc protected amino acid through initial reaction with oxalyl chloride followed by acyl azide formation with trimethylsilyl azide. The Curtius rearrangement was performed in refluxing *tert*-butanol to give the Boc protected amine **4-Me**. As a side product of this reaction, a dimeric species, **4-dimer**, was observed where the nitrene that formed during the rearrangement underwent an intermolecular C-H insertion at the position *ortho* to the methyl ester in a second molecule of diazaanthracene, (Figure 3). While the formation of this side product could be limited by further dilution of the reaction, it was never fully eliminated under the conditions used.

Scheme 3. Synthesis of protected amino acids **4** and **4-Me**.^a

^aReaction Conditions: (a) NaOH, THF/MeOH, 89%; (b) 1.1. Oxalyl chloride, CHCl₃; 1.2. TMSN₃, CHCl₃; 1.3. *t*BuOH, Δ, 77%; (c) KOH, MeOH, 60 °C – 30 °C, 90% (d) dppa, toluene, r.t., then toluene, *t*BuOH, Δ, 62%.

Use of a similar scheme for **3** resulted in low yields as a result of instability during the acid chloride formation. Unlike **3-Me**, which stays yellow after reaction with the oxalyl chloride, a solution of **3** turns black and little or no product is obtained. Results were similar with both thionyl chloride and 1-chloro-*N,N*,2-trimethylpropenylamine. As an alternative, diphenylphosphoryl azide was used, but required first an initial reaction in toluene overnight at room temperature, followed by further dilution with toluene and *t*BuOH before heating to reflux for several hours. This dilution step is again required to limit the formation of byproducts that occur during the Curtius rearrangement.

Conclusion

All compounds described above represent derivatives that are difficult to obtain in good yield through the standard synthetic routes described for the precursors **1** and **2-Cl**. Additionally, the methods for desymmetrization and conversion to the protected amino acids have provided large, rigid aromatic units that should serve as important building blocks in the development of supramolecular architectures. The synthetic routes described for these compounds offer a complementary

method for incorporating functional groups into aromatic oligoamide foldamers for the purposes of molecular recognition or reactivity. Studies looking at incorporating these units into longer sequences are under way and will be reported in due course.

Experimental

General Procedures. Unless otherwise stated all solvents and reagents were used without further purification. When required, dry solvents and bases were obtained directly prior to use by either distillation from CaH₂ (CHCl₃, triethylamine, and diisopropylethyl amine) or dried over alumina (THF, Toluene, and DCM). All solvent mixtures for chromatography are reported as (v/v). Compound **1** and dimethyl 10-chloro-4,6-dioxo-1,4,6,9-tetrahydropyrido[3,2-*g*]quinoline-2,8-dicarboxylate were synthesized as previously reported.^{27,34} ¹H and ¹³C NMR chemical shifts are reported in ppm and are calibrated against residual ¹H and ¹³C solvent signals of CDCl₃ (δ 7.26, 77.2) and DMSO-*d*₆ (δ 2.50, 39.4). The following notation is used for the ¹H NMR spectral splitting patterns: singlet (s), broad singlet (bs), doublet (d), triplet (t), multiplet (m). High resolution electrospray ionization oribitrap (ESI-oribitrap) mass spectra were measured in the positive ion mode.

Synthesis

Dimethyl 1,8-diaza-4,5-diisobutoxy-9-(bromomethyl)-2,7-anthracene dicarboxylate, 1-Br. In a 100 mL round-bottomed flask, compound **1** (5.00 g, 11.0 mmol), freshly recrystallized NBS (2.15 g, 12.1 mmol, 1.1 equiv.), and benzoyl peroxide (1.33 g, 5.5 mmol, 0.5 equiv.) were slurried in benzene (30 mL). The mixture was then heated to 65 °C and stirred overnight. Solvent was removed by rotary evaporation and the yellow residue was recrystallized from DCM/MeOH to yield the compound **1-Br** as yellow crystals. (5.2 g, 89%). ¹H NMR (CDCl₃, 300 MHz): δ 9.27 (s, 1H), 7.51 (s, 2H), 6.16 (s, 2H), 4.14 (d, ³J_{HH} = 6.4 Hz, 4H), 4.10 (s, 6H), 2.36 (m, 2H), 1.19 (d, ³J_{HH} = 6.8 Hz, 12H). ¹³C NMR (CDCl₃, 75 MHz): δ 166.4, 163.5, 151.0, 145.1, 135.9, 121.9, 117.2, 99.4, 75.4, 53.4, 28.4, 25.3, 19.3; mp 253-255 °C; HRMS (ESI) *m/z*: Calcd. for C₂₅H₃₀BrN₂O₆ [M+H]⁺ 533.1287, Found 533.1287. X-ray Structure: see supporting information.

Dimethyl 1,8-diaza-4,5-diisobutoxy-9-[(tert-butoxycarbonyl)amino]methyl]-2,7-anthracene dicarboxylate, 1-NHBoc. In a dry 50 mL round-bottomed flask **1-Br** (5.00 g, 9.4 mmol) and potassium ditertbutylimino dicarbonate^{37,40} (2.89 g, 11.3 mmol, 1.2 equiv.) were slurried in 20 mL of anhydrous DMF under an inert gas atmosphere. The flask was then heated to 50 °C for 12 hours. Solvent was removed on the vacuum line and then the crude residue was dissolved in 10 mL of MeCN. The mixture was heated to reflux and Mg(ClO₄)₂ (0.21 g, 0.9 mmol, 0.1 equiv.) was added. The reaction was carefully monitored by TLC and stopped when the intermediate product is no longer visible (~30 min). The reaction was diluted with 100 mL of EtOAc and washed with first water then brine solution. The organic layer was dried over MgSO₄, filtered, and then solvent was removed by rotary evaporation. The crude yellow solid was recrystallized with DCM/MeOH to give compound **1-NHBoc** as a yellow solid (4.31 g, 81%). ¹H NMR (CDCl₃, 300 MHz): δ 9.23 (s, 1H), 7.52 (s, 2H), 6.4 (bs, 1H), 5.79 (d, 2H), ³J_{HH} = 5.6 Hz,

4.15 (d, ³J_{HH} = 6.4 Hz, 4H), 4.09 (s, 6H), 2.37 (m, 2H), 1.42 (s, 9H), 1.20 (d, ³J_{HH} = 6.6 Hz, 12H). ¹³C NMR (CDCl₃, 75 MHz): δ 166.4, 163.7, 156.4, 150.4, 145.6, 145.6, 121.8, 116.0, 98.9, 78.8, 75.4, 53.3, 38.2, 28.7, 28.4, 19.3; mp 215-218 °C; HRMS (ESI) *m/z*: Calcd. for C₃₀H₄₀N₃O₈ [M+H]⁺ 570.2815, Found 570.2817.

Dimethyl 1,8-diaza-4,5-diisobutoxy-9-[azidomethyl]-2,7-anthracene dicarboxylate, 1-N₃. In a dry 50 mL round-bottomed flask **1-Br** (1.00 g, 1.9 mmol) and sodium azide (0.52 g, 9.4 mmol, 5.0 equiv.) were slurried in 15 mL of dioxane. 15-crown-5 (0.5 mL) was added and the reaction was stirred at room temperature for 72 hours. Solvent was removed and the crude yellow solid was redissolved in 100 mL of dichloromethane. The solution was then filtered through celite to remove the residual salts. Solvent was removed on a rotary evaporator and the crude product was recrystallized from DCM/MeOH to give compound **1-N₃** as a yellow solid (0.90 g, 97%). ¹H NMR (CDCl₃, 300 MHz): δ 9.29 (s, 1H), 7.52 (s, 2H), 5.87 (s, 2H), 4.15 (d, ³J_{HH} = 6.2 Hz, 4H), 4.08 (s, 6H), 2.37 (m, 2H), 1.20 (d, ³J_{HH} = 6.6 Hz, 12H). ¹³C NMR (CDCl₃, 75 MHz): δ 166.4, 163.6, 151.2, 146.1, 134.3, 121.8, 117.3, 99.3, 75.5, 53.3, 45.0, 28.5, 19.3; mp 231-235 °C; HRMS (ESI) *m/z*: Calcd. for C₂₅H₃₀N₅O₆ [M+H]⁺ 496.2191, Found 496.2194. X-ray Structure: see supporting information.

Dimethyl 1,8-diaza-4,5-diisobutoxy-9-(acetyloxy)methyl]-2,7-anthracene dicarboxylate, 1-OAc. In a dry 50 mL round-bottomed flask **1-Br** (1.00 g, 1.9 mmol) and silver acetate (0.47 g, 2.8 mmol, 1.5 equiv.) were slurried in 30 mL of dioxane. The reaction was heated to 60 °C and stirred overnight. The solution was poured into dichloromethane (100 mL) then filtered through celite to remove the residual silver salts. Solvent was removed on a rotary evaporator and the crude product was recrystallized from DCM/MeOH to give compound **1-OAc** as a yellow solid (0.80 g, 91%). ¹H NMR (CDCl₃, 300 MHz): δ 9.36 (s, 1H), 7.54 (s, 2H), 6.68 (s, 2H), 4.18 (d, ³J_{HH} = 6.4 Hz, 4H), 4.11 (s, 6H), 2.40 (m, 2H), 2.11 (s, 3H), 1.23 (d, ³J_{HH} = 6.7 Hz, 12H). ¹³C NMR (CDCl₃, 75 MHz): δ 171.2, 166.5, 163.5, 151.1, 146.3, 133.5, 121.6, 117.7, 99.0, 75.4, 58.0, 53.2, 28.4, 21.3, 19.3; mp 211-213 °C; HRMS (ESI) *m/z*: Calcd. for C₂₇H₃₃N₂O₈ [M+H]⁺ 513.2237, Found 513.2235. X-ray Structure: see supporting information.

Dimethyl 1,8-diaza-4,5-diisobutoxy-9-(hydroxymethyl)-2,7-anthracene dicarboxylate, 1-OH. In a dry 25 mL round-bottomed flask **1-Br** (0.60 g, 1.1 mmol) and silver carbonate (0.62 g, 2.3 mmol, 2.0 equiv.) were slurried in 10 mL of a 10% H₂O/dioxane solution under an inert gas atmosphere. The reaction was then stirred for 12 hours at 90 °C. DCM (30 mL) was added and the solution was passed through celite to remove the precipitated silver salts. Solvent was removed on a rotary evaporator and the crude yellow solid was recrystallized with DCM/MeOH to give compound **1-OH** as a yellow solid (0.43 g, 80%). ¹H NMR (CDCl₃, 300 MHz): δ 9.22 (s, 1H), 7.50 (s, 2H), 6.36 (t, ³J_{HH} = 6.6 Hz, 1H), 6.15 (d, ³J_{HH} = 6.4 Hz, 2H), 4.14 (d, ³J_{HH} = 6.4 Hz, 4H), 4.08 (s, 6H), 2.37 (m, 2H), 1.20 (d, ³J_{HH} = 6.8 Hz, 12H). ¹³C NMR (CDCl₃, 75 MHz): δ 166.1, 163.8, 150.0, 145.3, 137.9, 121.6, 115.9, 98.9, 75.4, 59.9, 53.4, 28.4, 19.3; mp 235-237 °C; HRMS (ESI) *m/z*: Calcd. for C₂₅H₃₁N₂O₇ [M+H]⁺ 471.2131, Found 471.2126.

Dimethyl 1,8-diaza-4,5-diisobutoxy-9-(nitrooxymethyl)-2,7-anthracene dicarboxylate, 1-ONO₂. In a dry 50 mL

round-bottomed flask **1-Br** (0.50 g, 0.9 mmol) and silver nitrate (0.24 g, 1.4 mmol, 1.5 equiv.) were slurried in 20 mL of dioxane under an inert gas atmosphere. The reaction was then stirred for 12 hours at room temperature. DCM (30 mL) was added and the solution was passed through celite to remove the precipitated silver salts. Solvent was removed on a rotary evaporator and the crude yellow solid was recrystallized with DCM/MeOH to give compound **1-ONO₂** as a yellow solid (0.39 g, 81%). ¹H NMR (CDCl₃, 300 MHz): δ 9.36 (s, 1H), 7.51 (s, 2H), 7.07 (s, 2H), 4.15 (d, ³J_{HH} = 6.4, 4H), 4.08 (s, 6H), 2.37 (m, 2H), 1.20 (d, ³J_{HH} = 6.8 Hz, 2H). ¹³C NMR (CDCl₃, 75 MHz): δ 166.1, 163.5, 151.6, 146.5, 128.8, 121.5, 119.0, 99.3, 75.5, 66.6, 53.3, 28.4, 19.3; mp 224–227 °C; HRMS (ESI) m/z: Calcd. for C₂₅H₃₀N₃O₉ [M+H]⁺ 516.1982, Found 516.1978. X-ray Structure: see supporting information.

Dimethyl 1,8-diaza-4,5-diisobutoxy-9-[(methyloxy)methyl]-2,7-anthracene dicarboxylate, 1-OMe. In a dry 25 mL round-bottomed flask **1-OAc** (0.10 g, 0.2 mmol) was slurried in 20 mL of MeOH. Concentrated sulfuric acid (0.01 mL, 0.2 mmol, 1.0 equiv.) was added and the reaction was stirred at reflux for 3 hours. The mixture was then neutralized with a saturated solution of NaHCO₃ and the product was extracted with DCM. Solvent was removed on the rotovap and the crude yellow solid was recrystallized with DCM/MeOH to give compound **1-OMe** as a yellow solid (0.08 g, 80%). ¹H NMR (CDCl₃, 300 MHz): δ 9.29 (s, 1H), 7.50 (s, 2H), 5.97 (s, 2H), 4.14 (d, ³J_{HH} = 6.4, 4H), 4.08 (s, 6H), 3.64 (s, 3H), 2.36 (m, 2H), 1.20 (d, ³J_{HH} = 6.6 Hz, 12H). ¹³C NMR (CDCl₃, 75 MHz): δ 166.5, 163.4, 151.0, 146.5, 135.8, 121.7, 117.1, 99.0, 75.3, 64.6, 59.4, 53.2, 28.4, 19.3; mp 211–214 °C; HRMS (ESI) m/z: Calcd. for C₂₆H₃₃N₂O₇ [M+H]⁺ 485.2282, Found 485.2285.

Dimethyl 1,8-diaza-4,5-diisobutoxy-9-(formyl)-2,7-anthracene dicarboxylate, 1=O. In a dry 50 mL round-bottomed flask **1-ONO₂** (0.40 g, 0.8 mmol) was slurried in 30 mL of dry dioxane. Triethylamine (0.97 mL, 8.0 mmol, 10.0 equiv.) was added and the reaction was heated at 85 °C for 16 hours. The reaction was poured into ice water, and the product was extracted into DCM. Solvent was removed on a rotary evaporator and the crude yellow solid was purified by column chromatography with Cyclohexane/Acetone to give **1=O** as a light yellow solid (0.15 g, 41%). ¹H NMR (CDCl₃, 300 MHz): δ 11.86 (s, 1H), 9.51 (s, 1H), 7.58 (s, 2H), 4.17 (d, ³J_{HH} = 6.4, 4H), 4.09 (s, 6H), 2.38 (m, 2H), 1.21 (d, ³J_{HH} = 6.8 Hz, 12H). ¹³C NMR (CDCl₃, 75 MHz): δ 194.5, 166.1, 163.6, 152.9, 146.8, 129.4, 122.5, 121.7, 99.70, 75.6, 53.61, 28.4, 19.3; mp 252–255 °C; HRMS (ESI) m/z: Calcd. for C₂₅H₂₉N₂O₇ [M+H]⁺ 469.1975, Found 469.1970.

Dimethyl 1,8-diaza-4,5-diisobutoxy-9-[N(N'-Methylimidazolium)methyl]-2,7-anthracene dicarboxylate, 1-imid. In a dry 50 mL round-bottomed flask **1-Br** (0.50 g, 0.9 mmol) was slurried in 20 mL of methylimidazole. The reaction was then stirred overnight hours at 60 °C. The solution was cooled to room temperature and diethyl ether (100 mL) was added. The powdery yellow product was collected by filtration and dried on the filter to give **1-imid** as a yellow solid (0.48 g, 83%). ¹H NMR (CDCl₃, 300 MHz): δ 9.55 (s, 1H), 9.34 (s, 1H), 7.88 (s, 1H), 7.70 (s, 1H), 7.53 (s, 2H), 6.71 (s, 2H), 4.18 (s, 6H), 4.17 (d, ³J_{HH} = 6.8 Hz, 4H), 4.15 (s, 3H), 2.38 (m, 2H), 1.19 (d, ³J_{HH} = 6.6 Hz, 12H). ¹³C NMR (CDCl₃, 75 MHz): δ 165.7, 164.1, 151.8, 145.4, 137.4, 129.7, 124.2, 123.0, 121.7, 119.4, 99.6, 75.7, 53.8, 43.9, 37.3, 28.3, 19.2;

mp 192–195 °C; HRMS (ESI) m/z: Calcd. for C₂₉H₃₅N₄O₆ [M+H]⁺ 535.2551, Found 535.2552.

Dimethyl 1,8-diaza-4,5-diisobutoxy-9-chloro-2,7-anthracene dicarboxylate, 2-Cl. In a dry 1 L round-bottomed flask, a mixture of dimethyl 10-chloro-4,6-dioxo-1,4,6,9-tetrahydropyrido[3,2-g]quinoline-2,8-dicarboxylate (26.0 g, 71.8 mmol), freshly distilled 2-methyl propanol (15.2 mL, 158.0 mmol, 2.2 equiv.) and triphenylphosphine (41.4 g, 158.0 mmol, 2.2 equiv.) was suspended in 500 mL anhydrous THF (freshly distilled). The flask was then hermetically closed and remained under protecting gas during the reaction time. (The reagents are not soluble in THF before the addition of diisopropyl azodicarboxylate). The reaction mixture was cooled to 0 °C in an ice bath. DIAD (31.1 mL, 158.0 mmol, 2.2 equiv.) was then added slowly to this mixture, and the resulting solution was stirred at 0 °C for 30 min and then overnight at room temperature. Solvents were rotary evaporated and the residue was re-crystallized from MeOH/DCM (2:2) by slow removal of the dichloromethane on the rotovap. Crystals were filtered using a fine sintered glass funnel and washed with cold methanol (–18 °C). The product was dried under reduced pressure to yield **2-Cl** as a yellow solid (24.1 g, 71%). ¹H NMR (CDCl₃, 300 MHz): δ 9.22 (s, 1H), 7.57 (s, 2H), 4.16 (d, ³J_{HH} = 6.4 Hz, 4H), 4.11 (s, 6H), 2.37 (m, 2H), 1.21 (d, ³J_{HH} = 6.8 Hz, 12H). ¹³C NMR (CDCl₃, 75 MHz): δ 166.2, 163.8, 152.0, 144.4, 134.6, 122.5, 115.1, 99.8, 75.7, 53.7, 28.4, 19.3; mp 261–263 °C; HRMS (ESI) m/z: Calcd. for C₂₄H₂₇ClN₂O₆ [M+H]⁺ 475.1636, Found 475.1634. X-ray Structure: see supporting information.

Dimethyl 1,8-diaza-4,5-diisobutoxy-9-amino-2,7-anthracene dicarboxylate, 2-NH₂. In a dry 25 mL round-bottomed flask **1-Cl** (0.50 g, 1.1 mmol) and triphenyl phosphine (0.55 g, 2.2 mmol, 2.0 equiv.) were slurried in 8.5 mL of DMF. Sodium azide (0.14 g, 2.2 mmol, 2.0 equiv.) was added and the solution was heated to 120 °C. The reaction was then monitored by TLC (50/50 Hex/EtOAc). When the starting material was no longer visible, 1N HCl (1.69 mL) was added and the reaction was stirred for an additional 3 hours. Solvent was removed by azeotropic distillation with toluene on a rotary evaporator. The crude orange-red solid was purified by recrystallization from DCM/MeOH to give compound **1-NH₂** as a bright red solid (0.30 g, 63%). ¹H NMR (CDCl₃, 300 MHz): δ 8.19 (s, 1H), 7.44 (s, 2H), 6.68 (bs, 2H), 4.09 (d, ³J_{HH} = 6.4 Hz, 4H), 4.06 (s, 6H), 2.36 (m, 2H), 1.18 (d, ³J_{HH} = 6.8 Hz, 12H). ¹³C NMR (CDCl₃, 75 MHz): δ 166.4, 163.0, 146.1, 145.1, 133.4, 122.7, 99.8, 98.3, 75.1, 53.1, 26.5, 19.4; mp 200–202 °C; HRMS (ESI) m/z: Calcd. for C₂₄H₃₀N₃O₆ [M+H]⁺ 456.2135, Found 456.2134. X-ray Structure: see supporting information.

Dimethyl 1,8-diaza-4,5-diisobutoxy-9-[bis(tert-butoxycarbonyl)amino]-2,7-anthracene dicarboxylate, 2-NBoc₂. In a dry 25 mL round-bottomed flask **2-NH₂** (0.25 g, 0.5 mmol) was slurried in 4 mL of dioxane. Di-tert-butyl dicarbonate (1.20 g, 5.0 mmol, 10.0 equiv.) and diisopropylethylamine (0.28 mL, 5.0 mmol, 10.0 equiv.) and dimethylaminopyridine (0.07 g, 0.5 mmol, 1.0 equiv.) were added and the solution was stirred overnight at 70 °C. Solvent was removed and the crude yellow solid was purified by column chromatography with Cyclohexane/EtOAc (50/50). Solvent was removed on a rotary evaporator and the product was recrystallized from DCM/MeOH to give compound **2-Boc₂** as a light yellow solid (0.29 g, 81%). ¹H NMR (CDCl₃, 300 MHz): δ 9.22 (s, 1H),

7.48 (s, 2H), 4.13 (d, $^3J_{\text{HH}} = 6.42$ Hz, 4H), 4.01 (s, 6H), 2.32 (m, 2H), 1.34 (s, 18H), 1.19 (d, $^3J_{\text{HH}} = 6.8$ Hz, 12H). ^{13}C NMR (CDCl_3 , 75 MHz): δ 166.7, 163.3, 152.4, 151.3, 143.4, 135.8, 122.0, 116.0, 99.3, 82.1, 75.4, 52.9, 28.4, 28.0, 19.3; mp 207–212 °C; HRMS (ESI) m/z : Calcd. for $\text{C}_{34}\text{H}_{46}\text{N}_3\text{O}_{10}$ $[\text{M}+\text{H}]^+$ 656.3183, Found 656.3196.

Dimethyl 1,8-diaza-4,5-diisobutoxy-9-[benzylmercatol]-2,7-anthracene dicarboxylate, 2-SBn. In a dry 25 mL round-bottomed flask **2-Cl** (1.00 g, 2.1 mmol), and Cs_2CO_3 (0.89 g, 2.7 mmol, 1.3 equiv.) were slurried in 5 mL of toluene. Benzylmercaptan (0.32 mL, 2.7 mmol, 1.3 equiv.) was added and the solution was stirred at room temperature overnight. Solvent was removed on a rotary evaporator and the crude orange-red solid was purified by column chromatography with Toluene/EtOAc (80/20). Solvent was removed on the rotovap and the product was recrystallized from DCM/MeOH to give compound **2-SBn** as a bright red solid (1.02 g, 86%). ^1H NMR (CDCl_3 , 300 MHz): δ 9.08 (s, 1H), 7.53 (dd, $J_{\text{ortho}} = 6.5$, $J_{\text{meta}} = 1.5$ Hz, 2H), 7.49 (s, 2H), 7.23–7.16 (m, 3H), 5.22 (s, 2H), 4.12 (d, $^3J_{\text{HH}} = 6.2$, 4H), 4.07 (s, 6H), 2.35 (m, 2H), 1.19 (d, $^3J_{\text{HH}} = 6.8$ Hz, 12H). ^{13}C NMR (CDCl_3 , 75 MHz): δ 166.5, 163.7, 149.8, 147.0, 139.6, 136.8, 129.8, 128.3, 127.0, 122.1, 114.2, 99.2, 75.4, 53.3, 40.9, 28.5, 19.3; mp 217–219 °C; HRMS (ESI) m/z : Calcd. for $\text{C}_{31}\text{H}_{35}\text{N}_2\text{O}_6\text{S}$ $[\text{M}+\text{H}]^+$ 563.2216, Found 563.2221. X-ray Structure: see supporting information.

Dimethyl 1,8-diaza-4,5-diisobutoxy-9,10-dihydro-2,7-anthracene dicarboxylate, 2-H₂. In a dry 250 mL round-bottomed flask, **2-Cl** (10.0 g, 21.1 mmol), K_2CO_3 (20.4 g, 147.7 mmol, 7.0 equiv.), and 10% Pd/C (2.2 g) were slurried in 100 mL dry DMF. Nitrogen was then bubbled through the solution for 15 minutes to remove oxygen. The solution was then saturated with H_2 by passing a stream of H_2 through the solution for 15 minutes. The reaction was then kept under an atmosphere of H_2 (provided by a balloon) for several hours (5–6 is usually sufficient) while carefully being monitored by TLC (1% MeOH in DCM). When the starting material was no longer visible, the reaction was diluted with DCM and passed through celite. After removal of solvent on a rotary evaporator, the crude product was triturated with MeOH and collected by filtration. After drying on the vacuum line **2-H₂** was obtained as an off white solid (7.3 g, 79%). ^1H NMR (CDCl_3 , 300 MHz): δ 7.56 (s, 2H), 4.50 (t, $^3J_{\text{HH}} = 3.0$ Hz, 2H), 4.05 (t, $^3J_{\text{HH}} = 3.0$ Hz, 2H), 4.01 (s, 6H), 3.94 (d, $^3J_{\text{HH}} = 6.4$ Hz, 4H), 2.21 (m, 2H), 1.11 (d, $^3J_{\text{HH}} = 6.8$ Hz, 12H). ^{13}C NMR (CDCl_3 , 75 MHz): δ 166.2, 163.1, 155.7, 147.9, 120.9, 106.3, 74.8, 53.1, 40.2, 28.3, 22.1, 19.1; mp 213–216 °C; HRMS (ESI) m/z : Calcd. for $\text{C}_{24}\text{H}_{31}\text{N}_2\text{O}_6$ $[\text{M}+\text{H}-\text{H}_2]^+$ 441.2026, Found 441.2024. The loss of hydrogen from protonated 9,10-dihydroanthracenes, to give the $[\text{M}-\text{H}]^+$ cation is an established phenomenon in 9,10-dihydroanthracenes.⁴¹ X-ray Structure: see supporting information.

Dimethyl 1,8-diaza-4,5-diisobutoxy-2,7-anthracene dicarboxylate, 2. Compound **2-H₂** (5.0 g, 11.3 mmol) and dry carbon (2.5 g) were slurried in 50 mL of dry toluene in a 250 mL round-bottomed flask. The solution was placed under an O_2 atmosphere and heated to 100 °C for 16 hours. The reaction was then diluted with 200 mL of DCM and poured onto a pad of silica. The product was then eluted with 2% MeOH in DCM. Solvent was removed on a rotary evaporator and the product was recrystallized from DCM/MeOH to give **2** as a bright yellow solid (4.2 g, 84%) ^1H NMR (CDCl_3 , 300 MHz): δ 9.27 (s, 1H), 9.18 (s, 1H), 7.51 (s, 2H), 4.15 (d, $^3J_{\text{HH}} = 6.4$

Hz, 4H), 4.11 (s, 6H), 2.37 (m, 2H), 1.20 (d, $^3J_{\text{HH}} = 6.8$ Hz, 12H). ^{13}C NMR (CDCl_3 , 75 MHz): δ 166.2, 163.3, 151.6, 147.7, 131.0, 122.0, 116.9, 99.1, 75.3, 53.5, 28.3, 19.2; mp 244–246 °C; HRMS (ESI) m/z : Calcd. for $\text{C}_{24}\text{H}_{29}\text{N}_2\text{O}_6$ $[\text{M}+\text{H}]^+$ 441.2026, Found 441.2022. X-ray Structure: see supporting information.

Dimethyl 1,8-diaza-4,5-diisobutoxy-9-bromo-2,7-anthracene dicarboxylate, 2-Br. In a dry 25 mL round-bottomed flask, compound **2** (0.50 g, 1.1 mmol) and freshly recrystallized NBS (0.24 g, 1.3 mmol, 1.2 equiv.) were slurried in 10 mL of a 1:1 mixture of CHCl_3 /DMF. The solution was heated to 60 °C and stirred overnight. Solvent was then removed and the crude product was purified by column chromatography using 10% EtOAc/Toluene to obtain **2-Br** (0.41 g, 70%). ^1H NMR (CDCl_3 , 300 MHz): δ 9.29 (s, 1H), 7.57 (s, 2H), 4.17 (d, $^3J_{\text{HH}} = 6.2$ Hz, 2H), 4.11 (s, 6H), 2.37 (m, 2H), 1.21 (d, $^3J_{\text{HH}} = 6.6$ Hz, 12H). ^{13}C NMR (CDCl_3 , 75 MHz): δ 166.2, 163.9, 152.3, 145.7, 122.9, 116.3, 99.7, 75.7, 53.7, 28.5, 27.1, 19.3; mp 253–259 °C; HRMS (ESI) m/z : Calcd. for $\text{C}_{24}\text{H}_{28}\text{BrN}_2\text{O}_6$ $[\text{M}+\text{H}]^+$ 519.1131, Found 519.1132. X-ray Structure: see supporting information.

1,8-diaza-4,5-diisobutoxy-7-(methoxycarbonyl)-2-anthracene carboxylic acid, 3. Compound **2** (4.00 g, 9.1 mmol) was slurried in boiling MeOH (200 mL) and heated at 65 °C with stirring until all solid dissolved. To this solution, KOH (0.76 g, 13.6 mmol, 1.5 equiv.) dissolved in 20 mL of MeOH was added dropwise. The reaction was stirred at 65 °C until a precipitate was observed. The reaction was then cooled to 35 °C and stirred overnight. The solid was collected by filtration and washed with cold MeOH, 5% citric acid solution, and then water. After drying on the filter for 1 hour, the solid was redissolved in DCM and further dried over Na_2SO_4 . The solution was then filtered and solvent removed on a rotary evaporator. After drying on the vacuum line **3** was obtained as a yellow solid (3.50 g, 90%). ^1H NMR (CDCl_3 , 300 MHz): δ 9.31 (s, 1H), 9.04 (s, 1H), 7.58 (s, 1H), 7.55 (s, 1H), 4.19 (d, $^3J_{\text{HH}} = 6.4$ Hz, 2H), 4.17 (d, $^3J_{\text{HH}} = 6.4$ Hz, 2H), 4.13 (s, 3H), 2.39 (m, 2H), 1.21 (d, $^3J_{\text{HH}} = 6.8$ Hz, 6H), 1.20 (d, $^3J_{\text{HH}} = 6.8$ Hz, 6H). ^{13}C NMR (CDCl_3 , 75 MHz): δ 166.1, 165.0, 164.3, 163.6, 152.2, 150.3, 147.9, 145.5, 129.3, 122.4, 122.1, 117.8, 99.6, 97.2, 76.0, 75.6, 53.7, 28.4, 28.4, 19.3, 19.3. HRMS (ESI) m/z : Calcd. for $\text{C}_{23}\text{H}_{27}\text{N}_2\text{O}_6$ $[\text{M}+\text{H}]^+$ 427.1864, Found 427.1861.

Sodium 1,8-diaza-4,5-diisobutoxy-7-(methoxycarbonyl)-9-methyl-2-anthracene carboxylate, 3-Me. Compound **1** (10.0 g, 22.0 mmol) was placed in a 1 L round-bottomed flask and dissolved in 750 mL of THF:MeOH (75:25 v/v). NaOH (1.01 g, 25.3 mmol, 1.15 equiv.) dissolved in MeOH (20 mL) was slowly added to this mixture. The reaction was then stirred at room temperature for 24 hours, during which time the product precipitates from solution. The white/yellow solid is collected by filtration and washed with cold MeOH. The solid is dried under vacuum to give the sodium salt of the mono-carboxylate of **1** (**3-Me**) as a light yellow solid (9.1 g, 89%). The compound was used in this form for subsequent reactions. However, because of the limited solubility of **3-Me** in the carboxylate form, for characterization, 100 mg of **3-Me** was washed with a 5% citric acid solution and then extracted into CHCl_3 . After washing with water and brine, the solution was dried over Na_2SO_4 . Solvent was removed on a rotary evaporator and then dried under vacuum to give the carboxylic acid. ^1H NMR (CDCl_3 , 300 MHz): δ 9.19 (s, 1H), 7.58 (s, 1H),

7.52 (s, 1H), 4.18 (d, $^3J_{\text{HH}} = 6.4$ Hz, 2H), 4.15 (d, $^3J_{\text{HH}} = 6.4$ Hz, 2H), 4.11 (s, 3H), 3.43 (s, 3H) 2.38 (m, 2H), 1.21 (d, $^3J_{\text{HH}} = 6.8$ Hz, 6H), 1.20 (d, $^3J_{\text{HH}} = 6.8$ Hz, 6H). ^{13}C NMR (CDCl_3 , 75 MHz): δ 166.2, 164.9, 164.3, 163.3, 150.3, 147.9, 145.7, 143.3, 137.1, 121.6, 121.1, 114.0, 99.2, 96.4, 75.7, 75.3, 53.3, 28.5, 28.4, 19.3, 19.2, 12.7. HRMS (ESI) m/z : Calcd. for $\text{C}_{24}\text{H}_{29}\text{N}_2\text{O}_6$ $[\text{M}+\text{H}]^+$ 441.2020, Found 441.2018.

1,8-diaza-4,5-diisobutoxy-7-[(tert-butoxycarbonyl)amino]-2-anthracene carboxylate, 4. In a dry 100 mL round bottomed flask equipped with a stir bar, **3** (3.46 g, 8.1 mmol) was slurried in 25 mL of dry toluene under a nitrogen atmosphere. DIPEA (2.83 mL, 16.2 mmol, 2 equiv.) and DPPA (3.49 mL, 16.2 mmol, 2 equiv.) were added and the reaction was stirred at room temperature overnight. The reaction was then diluted with an additional 20 mL of dry toluene and anhydrous *t*BuOH (40 mL) was added. The flask was then transferred to a 100 °C oil bath and stirred for 6 hours. Solvent was removed on a rotary evaporator and the crude material was redissolved in 1:1 DCM:MeOH. After slow evaporation of DCM on the rotovap, the solid product was collected by filtration and dried under vacuum to yield **4** as a light yellow solid (2.49 g, 62 %). ^1H NMR (CDCl_3 , 300 MHz): δ 9.11 (s, 1H), 8.60 (s, 1H), 7.68 (s, 1H), 7.66 (s, 1H), 7.44 (s, 1H), 4.12 (d, $^3J_{\text{HH}} = 6.4$ Hz, 2H), 4.11 (d, $^3J_{\text{HH}} = 6.4$ Hz, 2H), 4.10 (s, 3H), 2.35 (m, 2H), 1.55 (s, 9H), 1.19 (d, $^3J_{\text{HH}} = 6.8$ Hz, 6H), 1.18 (d, $^3J_{\text{HH}} = 6.8$ Hz, 6H). ^{13}C NMR (CDCl_3 , 75 MHz): δ 166.6, 163.6, 163.4, 154.7, 152.7, 151.0, 148.2, 147.4, 126.1, 120.8, 119.4, 116.8, 98.3, 92.4, 81.6, 75.2, 75.0, 53.5, 28.4, 19.4, 19.3; mp 258–263 °C; HRMS (ESI) m/z : Calcd. for $\text{C}_{27}\text{H}_{36}\text{N}_3\text{O}_6$ $[\text{M}+\text{H}]^+$ 498.2604, Found 498.2605.

Methyl 1,8-diaza-4,5-diisobutoxy-7-[(tert-butoxycarbonyl)amino]-9-methyl-2-anthracene carboxylate, 4-Me. The sodium salt of **3-Me** (10.0 g, 21.7 mmol), in a nitrogen flushed 250 mL round bottom flask equipped with a septum and stir bar, was slurried in dry DCM (50 mL). A needle was inserted into the septa to act as a gas vent while, oxalyl chloride (12.9 mL, 151.6 mmol, 7 equiv.) was added slowly to the mixture via a syringe. The reaction was stirred for 2–4 hours at room temperature after which time the solution turned orange and appeared slightly cloudy. Solvent was removed under vacuum and the yellow-orange solid further dried on a vacuum line for 4 hours. The solid was then redissolved in dry DCM (50 mL) and trimethylsilyl azide (8.5 mL, 65.0 mmol, 3 equiv.) was added. The mixture was then allowed to stir overnight (12 hours) at room temperature. Solvent was removed under vacuum. Anhydrous *t*BuOH (50 mL) was then added via syringe and the resulting yellow slurry refluxed for 12 hours. Solvent was removed with a rotary evaporator. The crude solid was then dissolved in DCM and filtered through celite. After removal of solvent, the mixture was recrystallized by slow evaporation of DCM from a 2:1 mixture of DCM:MeOH to give **4-Me** as a bright yellow solid (8.5 g, 77%). ^1H NMR (CDCl_3 , 300 MHz): δ 9.01 (s, 1H), 7.67 (s, 1H), 7.56 (s, 1H), 7.42 (s, 1H), 4.11 (d, $^3J_{\text{HH}} = 6.4$ Hz, 4H), 4.08 (s, 3H), 3.23 (m, 3H), 2.34 (m, 2H), 1.57 (s, 9H), 1.19 (d, $^3J_{\text{HH}} = 6.8$ Hz, 6H), 1.18 (d, $^3J_{\text{HH}} = 6.4$ Hz, 6H). ^{13}C NMR (CDCl_3 , 75 MHz): δ 166.7, 163.6, 163.5, 152.9, 152.6, 149.3, 146.2, 145.2, 133.6, 119.9, 119.0, 113.4, 97.7, 91.9, 81.3, 74.9, 53.2, 28.4, 19.3, 12.6; mp 233–235 °C; HRMS (ESI) m/z : Calcd. for $\text{C}_{28}\text{H}_{38}\text{N}_3\text{O}_6$ $[\text{M}+\text{H}]^+$ 512.2761, Found 512.2760.
