HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
Optimal Partial Mass Transportation and Obstacle Monge–Kantorovich Equation

Noureddine Igbida† and Van Thanh Nguyen‡

Abstract. Optimal partial mass transport, which is a variant of the optimal transport problem, consists in transporting effectively a prescribed amount of mass from a source to a target. The problem was first studied by Caffarelli and McCann [12, Ann. of Math., 2010] and Figalli [21, Arch. Ration. Mech. Anal., 2010] with a particular attention to the quadratic cost. Our aim here is to study the optimal partial mass transport problem with Finsler distance costs including the Monge cost given by the Euclidean distance. Our approach is different and our results do not follow from previous works. Among our results, we introduce a PDE of Monge–Kantorovich type with a double obstacle to characterize optimal active submeasures, Kantorovich potential and optimal flow for the optimal partial transport problem. This new PDE enables us to study the uniqueness and monotonicity results for the optimal active submeasures. Another interesting issue of our approach is its convenience for numerical analysis and computations that we develop in a separate paper [23, IMA J. Numer. Anal., 2017].

1. Introduction

The Monge–Kantorovich (MK) problem (or optimal transport) aims to find the best way to move all mass from a given source into a prescribed target. The source and target are modelled by two finite Radon measures $\mu, \nu \in \mathcal{M}^+_b(\mathbb{R}^N)$ with $\mu(\mathbb{R}^N) = \nu(\mathbb{R}^N)$ and the problem can be written as

$$\min_{\gamma \in \mathcal{M}^+_b(\mathbb{R}^N \times \mathbb{R}^N)} \left\{ \mathcal{K}(\gamma) := \int_{\mathbb{R}^N \times \mathbb{R}^N} c(x,y)d\gamma : \pi_x \# \gamma = \mu, \pi_y \# \gamma = \nu \right\},$$

Key words and phrases. Optimal transport, optimal partial transport, Monge–Kantorovich problem, minimum flow problem, obstacle Monge–Kantorovich equation, tangential gradient, nonlinear PDE.

†E-mail: noureddine.igbida@unilim.fr
‡E-mail: van-thanh.nguyen@unilim.fr
where $\pi_x \# \gamma$ and $\pi_y \# \gamma$ are marginals of $\gamma$ (see Section 2) and $c(x, y)$ is a given ground cost, i.e., $c(x, y)$ is the cost one pays to move one unit of the material from $x$ to $y$. This problem and related topics are central in the optimal transport theory which has become popular in the last few decades with applications in PDEs, differential geometry, image processing and many other areas. For a further discussion on the MK problem, its history and applications, we refer to pedagogical books [1], [31], [34] and [35].

The partial Monge–Kantorovich (PMK) problem (or optimal partial transport) is a very natural extension of the original optimal transport problem. The problem aims to study the case where only a part of the commodity (respectively, consumer demand) of total mass $m$ needs to be transported (respectively, fulfilled). Given $\mu, \nu \in \mathcal{M}_b^+(\mathbb{R}^N)$ and a prescribed total mass $0 \leq m \leq \min\{\mu(\mathbb{R}^N), \nu(\mathbb{R}^N)\}$, the PMK problem reads as follows

$$\min_{\gamma \in \mathcal{M}_b^+(\mathbb{R}^N \times \mathbb{R}^N)} \left\{ \mathcal{K}(\gamma) := \int_{\mathbb{R}^N \times \mathbb{R}^N} c(x, y) d\gamma : \pi_x \# \gamma \leq \mu, \pi_y \# \gamma \leq \nu, \gamma(\mathbb{R}^N \times \mathbb{R}^N) = m \right\}.$$  

This generalized problem brings out new unknown quantities $\rho_0 := \pi_x \# \gamma$ and $\rho_1 := \pi_y \# \gamma$ called active submeasures. Here $\rho_0$ and $\rho_1$ are the sites where the commodity is taken and the consumer demand is fulfilled, respectively. Existence, uniqueness and regularity issues were initially studied by Caffarelli and McCann [12] with a special focus on the quadratic cost, i.e., $c(x, y) = |x - y|^2$. Thereafter, in an original paper [21], Figalli significantly improves the results. In particular, he removes the disjointness assumption on the supports of the corresponding initial measures. The regularity issues are also discussed in [15, 24] for $c(x, y) = |x - y|^2$ and in [14] for general costs under assumptions on "smoothness" of $c$ and regularity of $\mu, \nu$. In [6], Barrett and Prigozhin study the problem from the numerical point of view for the case where $c(x, y) = |x - y|$.

In this paper, our aim is to give a complete and rigorous study of the PMK problem with the cost given by a Finsler distance $c(x, y) = d_F(x, y)$ (including the case of Euclidean distance cost). We introduce first the Kantorovich-type duality for the PMK problem with general costs. Then, using the triangle inequality satisfied by $d_F$, we introduce the notion of Kantorovich potential for the PMK problem with Finsler distance costs. Recall that in the case $c(x, y) = |x - y|^2$, the obstacle Monge–Ampère equation (cf. [12] and [21]) plays an important role to gather many informations on the PMK problem. In our case, we introduce the obstacle Monge-Kantorovich (OMK) equation and show how it is information-rich PDE for the PMK problem and how it can operate effectively. In particular, the uniqueness of the so called optimal active submeasures is one of the main issues of our approach connected to the OMK equation. Notice that an interesting resulting numerical study of the PMK problem can be found in [23].

Before giving the plan of the paper, let us take a while to comment our approach and main ideas. It is not difficult to see that the PMK problem is a bilevel optimization problem that aims to find the optimal active submeasures with the constraint on the total mass as well as the optimal plan. The authors in [12] introduce a Lagrange multiplier $\lambda$ for the mass constraint, add a point at infinity which acts as a tariff-free reservoir for transporting the extra mass, and study the relations given by classical duality results. In their duality, $\lambda$ is a parameter to be straightened to study the original PMK problem. In this way, they could deduce existence and uniqueness of minimizers when the supports of $\mu$ and $\nu$ are disjoint. As to the strategy of [21]
is to study directly the minimization problem by studying the convexity of the function that
associates to each $\mathbf{m}$ the total Monge-Kantorovich work. In particular, this allows the author to
prove the uniqueness without the disjoint support condition on $\mu$ and $\nu$. Note that the methods
used in [12] and [21] do not work for the uniqueness of optimal active submeasures of the PMK
problem with the Euclidean cost (a particular case of Finsler costs). Our point of view is to
obtain the uniqueness via the study of the OMK equation. Our approach is different and our
results do not follow readily from previous works. We begin by handling directly the problem
for general costs by adding two arbitrary sites in $\mathbb{R}^N$ to process the problem into a balanced
optimal mass transportation. Taking the cost for free to the new sites, we show that the new
total work coincides with the total work of the PMK problem. Moreover, combining this with
classical duality results, we introduce a bilevel maximization problem to provide a natural dual
partial Monge–Kantorovich (DPMK) problem for the optimal partial transportation. In the
case of Finsler distance, the variable of the DPMK problem can be expressed as a couple $(\lambda, u)$
where $u$ can be interpreted as the Kantorovich potential associated with the PMK problem and
$\lambda$ would be used to give informations on active submeasures. Recall that in the case where
the cost is given by the square of the Euclidean distance (cf. [12]), the connection between the
obstacle Monge–Ampère PDE and the PMK problem is given by a map that associates to each
value parameter $\lambda$ a solution of the Monge–Ampère PDE. In our case, we introduce a map
that associates to each value $\lambda$ a solution of the OMK equation. Then, we show how a right
value $\lambda_m$ enters in connection with the Kantorovich potential to bring out the solution of the
PMK problem. Among the main issues of our approach, the uniqueness of the optimal active
submeasures as well as their monotonicity hold true in the case where $\mu$ and $\nu$ are absolutely
continuous without disjointness condition of the supports.

The paper is organized as follows: In Section 2, we start in the first part by recalling the
Kantorovich duality for a general lower semicontinuous cost function $c$. In the second part of
Section 2, we summarize our main results on the PMK problem for a general cost $c$ as well as
for the case where $c$ satisfies the triangle inequality. The third part deserves the results for the
case of Finsler distance and the OMK equation. The remaining sections aim to prove the main
results. The proof of the duality is given in Section 3. We study the existence and uniqueness
issues for the OMK equation in Section 4. In Section 5, we show the connection between the
OMK equation and the optimal active submeasures for the PMK problem by using the DPMK
problem and the partial minimum flow problem. Thanks to this connection and the results
on the OMK equation, we deduce the uniqueness of optimal active submeasures. To finish the
proof of the main results, we study some strong $L^1$ continuous dependence and monotonicity of
the solution of the OMK equation with respect to the obstacle in Section 6. We terminate the
paper by an appendix in which we give a chain rule for the tangential gradient with respect to
a measure.

2. Preliminaries and main results

In this section, we recall the Kantorovich duality for the optimal transport problem with a
general cost $c : \mathbb{R}^N \times \mathbb{R}^N \to [0, +\infty]$. After that, we summarize our main results. The details of
the proofs are given in the remaining sections.
Given metric spaces $X_1, X_2$, a measure $\eta \in \mathcal{M}_b^+(X_1)$ and Borel map $T : X_1 \rightarrow X_2$, we denote by $T_#\eta$ the pushforward measure of $\eta$ by $T$,

$$T_#\eta(B) := \eta(T^{-1}(B)) \text{ for every Borel subset } B \subset X_2.$$

2.1. Preliminaries on Monge–Kantorovich problem. To begin with, we assume that $\mu(\mathbb{R}^N) = \nu(\mathbb{R}^N)$. The Monge–Kantorovich problem (MK) reads as

$$\min \left\{ \mathcal{K}(\gamma) := \int_{\mathbb{R}^N \times \mathbb{R}^N} c(x, y) \, d\gamma : \gamma \in \pi(\mu, \nu) \right\},$$

where

$$\pi(\mu, \nu) := \{ \gamma \in \mathcal{M}_b^+(\mathbb{R}^N \times \mathbb{R}^N) : \pi_x\#\gamma = \mu, \pi_y\#\gamma = \nu \}.$$

Here $\pi_x, \pi_y : \mathbb{R}^N \times \mathbb{R}^N \rightarrow \mathbb{R}^N$ denote the standard projections and are given by $\pi_x(x, y) = x, \pi_y(x, y) = y$ for any $x, y \in \mathbb{R}^N$. The measure $\gamma \in \pi(\mu, \nu)$ is called transport plan. One of basic concepts in the optimal transport theory is the Kantorovich duality that can be restated as follows:

**Theorem 2.1.** (cf. [35], Chapter 5) Let $c$ be a lower semicontinuous cost function (l.s.c.) and $\mu, \nu \in \mathcal{M}_b^+(\mathbb{R}^N)$ be such that $\mu(\mathbb{R}^N) = \nu(\mathbb{R}^N)$. Then

(i) The MK problem has an optimal plan and the Kantorovich duality holds true, i.e.

$$\min \{ \mathcal{K}(\gamma) : \gamma \in \pi(\mu, \nu) \} = \sup \left\{ \int_{\mathbb{R}^N} u \, d\mu + \int_{\mathbb{R}^N} v \, d\nu : (u, v) \in \mathcal{S}_c(\mu, \nu) \right\},$$

(2.1)

(ii) It does not change the value of the supremum in the right-hand side of (2.1) if one restricts the definition of $\mathcal{S}_c(\mu, \nu)$ to those functions $(u, v)$ which are bounded and continuous.

(iii) If $c(x, y) \leq C_\mu(x) + C_\nu(y)$ for some $(C_\mu, C_\nu) \in L_1^1(\mathbb{R}^N) \times L_1^1(\mathbb{R}^N)$, then the dual problem on the right-hand side (called Kantorovich dual problem) has an optimal solution.

(iv) If the cost function satisfies the triangle inequality and $c(x, x) = 0$ for any $x \in \mathbb{R}^N$, then the Kantorovich dual problem can be rewritten as

$$\sup \left\{ \int_{\mathbb{R}^N} u \, d(\nu - \mu) : u \in \text{Lip}_c \right\},$$

where $\text{Lip}_c := \{ u : \mathbb{R}^N \rightarrow \mathbb{R} : u \in L_1^1 \cap L_1^1, u(y) - u(x) \leq c(x, y) \forall x, y \in \mathbb{R}^N \}$. A solution of the Kantorovich dual problem is called Kantorovich potential.

An interesting situation where the triangle inequality is fulfilled corresponds to the case where the cost is proportional to a distance. Monge’s original optimal mass transport problem corresponds to the Euclidean distance. The case where the cost $c$ is given by a continuous Finsler distance has been studied recently in [22] (see also [30] for the symmetric case).
Let us begin with a reminder concerning Finsler metric. A continuous function \( F: \mathbb{R}^N \times \mathbb{R}^N \rightarrow [0, +\infty) \) is called Finsler metric on \( \mathbb{R}^N \) if

- \( F(x, t) \) is positively 1-homogeneous \( \forall x \in \mathbb{R}^N \), i.e.
  \[ F(x, tv) = tF(x, v) \] for every \( x \in \mathbb{R}^N, v \in \mathbb{R}^N \) and \( t > 0 \);
- \( F(x, .) \) is convex for every \( x \in \mathbb{R}^N \).

In addition, in this paper, we assume that \( F \) is nondegenerate in the sense that there exist \( \beta, \alpha > 0 \) such that

\[ \alpha|v| \leq F(x, v) \leq \beta|v| \] for all \( (x, v) \in \mathbb{R}^N \times \mathbb{R}^N \).

The Finsler distance \( d_F \) on \( \mathbb{R}^N \) is defined by

\[
d_F(x, y) = \inf \left\{ \int_0^1 F(\xi(t), \dot{\xi}(t)) dt : \xi \in \Gamma_{x,y}(\mathbb{R}^N) \right\}, \tag{2.2}
\]

where \( \Gamma_{x,y}(\mathbb{R}^N) \) is the set of Lipschitz curves on \([0, 1]\) taking values in \( \mathbb{R}^N \) joining \( x \) to \( y \). Under the above assumptions, it is known that the inf problem (2.2) is actually the minimum and that \( d_F \) is not necessary symmetric distance, i.e. \( d_F \) satisfies

- \( d_F(x, y) \geq 0 \); \( d_F(x, y) = 0 \) if and only if \( x = y \).
- \( d_F(x, y) \leq d_F(x, z) + d_F(z, y) \) for any \( x, y, z \in \mathbb{R}^N \).

The polar function \( F^* \) of \( F \) is defined by

\[
F^*(x, p) := \sup \{ \langle v, p \rangle : F(x, v) \leq 1 \} \quad \text{for} \quad x, p \in \mathbb{R}^N.
\]

It is easy to see that \( F^* \) is also a continuous, non-degenerate Finsler metric and

\[
\langle \xi, p \rangle \leq F^*(x, p) F(x, v) \quad \forall x, v, p \in \mathbb{R}^N.
\]

Now, we consider the optimal transport problem of moving \( \mu \) into \( \nu \) with the cost \( c = d_F \). Since the cost \( d_F \) satisfies the triangle inequality and \( d_F(x, x) = 0 \) for any \( x \in \mathbb{R}^N \), we have

\[
\min \left\{ K(\sigma) : \sigma \in \pi(\mu, \nu) \right\} = \sup \left\{ \int_{\mathbb{R}^N} ud(\nu - \mu) : u \in \text{Lip}_{d_F} \right\}.
\]

In the case where \( F(x, v) = |v| \) for any \( (x, v) \in \mathbb{R}^N \times \mathbb{R}^N \), it is clear that \( d_F \) is the Euclidean distance. For regular densities \( \mu \) and \( \nu \), Evans and Gangbo proved that the characterization of the Kantorovich potential may be given by a nonlinear PDE of the \( p \)-Laplacian type with \( p = \infty \). Since [11], this PDE is called Monge–Kantorovich equation and formally reads

\[
\begin{cases}
  -\nabla \cdot \Phi = \nu - \mu & \text{in} \ D^\prime(\mathbb{R}^N) \\
  u \in \text{Lip}_{d_F}, \quad \Phi \cdot \nabla u = |\Phi|.
\end{cases} \tag{2.3}
\]

Roughly speaking, the flux \( \Phi \) in (2.3) is called the transportation flow and its total variation \( |\Phi| \) gives the density of the transportation. Formally, the second line of (2.3) conceives the equation

\[
\Phi \in \partial II_{\overline{B}(0, 1)}(\nabla u),
\]

where \( \overline{B}(0, 1) \) is the Euclidean closed unit ball.
As we will see, among our results, we give a generalization of the PDE (2.3) for general Finsler metrics. Actually, for a Finsler metric $F$, (2.3) reads formally
\[
\begin{align*}
-\nabla \cdot \Phi &= \nu - \mu & \text{in } D'(\mathbb{R}^N) \\
u &\in Lip_{d_F}, \quad \Phi \cdot \nabla u = F(, \Phi).
\end{align*}
\] (2.4)

In general, since $\Phi$ is a finite Radon vector measure, the second equation of (2.4) needs to be understood in the sense of tangential gradient with respect to a measure. Moreover, a couple $(u, \Phi)$ is said to satisfy the PDE (2.4) if $(u, \Phi) \in Lip_{d_F} \times M_b(\mathbb{R}^N; \mathbb{R}^N)$, $-\nabla \cdot \Phi = \nu - \mu$ in $D'(\mathbb{R}^N)$ and
\[
\frac{\Phi}{|\Phi|} \cdot \nabla |\Phi|u = F\left(\frac{\Phi}{|\Phi|}(\cdot)\right), \quad |\Phi| - \text{ a.e. in } \mathbb{R}^N.
\]

Here, we denote by $\frac{\Phi}{|\Phi|}$ the density of $\Phi$ with respect to $|\Phi|$ and by $\nabla |\Phi|u$ the tangential gradient of $u$ with respect to $|\Phi|$ (cf. [10, 11, 25]) which is well-defined for any Lipschitz continuous function. Following [25, Lemma 4.9], given $\Phi \in M_b(\mathbb{R}^N; \mathbb{R}^N)$ and $\eta \in M_b(\mathbb{R}^N)$ such that $-\nabla \cdot \Phi = \eta$ in $D'(\mathbb{R}^N)$, we have
\[
\int_{\mathbb{R}^N} \frac{\Phi}{|\Phi|} \cdot \nabla |\Phi| \xi d|\Phi| = \int_{\mathbb{R}^N} \frac{\Phi}{|\Phi|} \cdot \nabla \xi d|\Phi| = \int_{\mathbb{R}^N} \xi d\eta \quad \text{for all } \xi \in C_0^\infty(\mathbb{R}^N).
\] (2.5)

Moreover, one can prove that (using approximation and (2.5))
\[
\int_{\mathbb{R}^N} \frac{\Phi}{|\Phi|} \cdot \nabla |\Phi| \xi d|\Phi| = \int_{\mathbb{R}^N} \xi d\eta \quad \text{for all } \xi \in Lip(\mathbb{R}^N) \cap C_b(\mathbb{R}^N).
\]

### 2.2. Main result for the PMK with general costs.

Assume that $\mu, \nu \in M_b^+(\mathbb{R}^N)$ are compactly supported and
\[
m_{\text{max}} := \min\{\mu(\mathbb{R}^N), \nu(\mathbb{R}^N)\}.
\]

Given a total mass $m \in [0, m_{\text{max}}]$, the PMK problem aims to transport effectively a total mass $m$ from a supply submeasure of $\mu$ into a submeasure of $\nu$. The set of submeasures of mass $m$ is given by
\[
Sub_m(\mu, \nu) := \{(\rho_0, \rho_1) \in M_b^+(\mathbb{R}^N) \times M_b^+(\mathbb{R}^N) : \rho_0 \leq \mu, \rho_1 \leq \nu, \rho_0(\mathbb{R}^N) = \rho_1(\mathbb{R}^N) = m\}.
\]

Then the PMK reads as
\[
\min \left\{ K(\gamma) := \int_{\mathbb{R}^N \times \mathbb{R}^N} c(x, y) d\gamma : \gamma \in \pi_m(\mu, \nu) \right\},
\] (2.6)

where
\[
\pi_m(\mu, \nu) := \left\{ \gamma \in \pi(\rho_0, \rho_1) : (\rho_0, \rho_1) \in Sub_m(\mu, \nu) \right\}.
\]

The couple $(\rho_0, \rho_1) \in Sub_m(\mu, \nu)$ is called a couple of active submeasures. It is a couple of optimal active submeasures if it solves the PMK (2.6). That is, there exists an optimal plan $\gamma$ of the PMK (2.6) such that $\gamma \in \pi(\rho_0, \rho_1)$.

Our main result concerning duality for the PMK problem with general costs is the following.
Theorem 2.2. Let \( \mu, \nu \in M^+_b(\mathbb{R}^N) \) be measures with compact supports \( X \) and \( Y \), \( m \in [0, m_{\text{max}}] \). Assume that \( c \) is lower semi continuous and bounded on \( X \times Y \). The PMK problem has a solution \( \sigma^* \in \pi_m(\mu, \nu) \) and the Kantorovich duality turns into

\[
\mathcal{K}(\sigma^*) = \min_{\gamma \in \pi_m(\mu, \nu)} \left\{ \int_{\mathbb{R}^N \times \mathbb{R}^N} c \, d\gamma \right\} = \max_{\lambda \in \mathbb{R}^+, (\phi, \psi) \in S_c^\lambda(\mu, \nu)} \left\{ \int_{\mathbb{R}^N} \phi \, d\mu + \int_{\mathbb{R}^N} \psi \, d\nu + \lambda m : \lambda \in \mathbb{R}^+, (\phi, \psi) \in S_c^\lambda(\mu, \nu) \right\},
\]

where

\[
S_c^\lambda(\mu, \nu) := \{ (\phi, \psi) \in L^1_c \times L^1_c : \phi \leq 0, \psi \leq 0 \text{ and } \phi(x) + \psi(y) + \lambda \leq c(x, y) \forall x, y \in \mathbb{R}^N \}.
\]

Moreover, \( \sigma \in \pi_m(\mu, \nu) \) and \( (\lambda, \phi, \psi) \in \mathbb{R}^+ \times S_c^\lambda(\mu, \nu) \) are solutions, respectively, if and only if

\[
\phi(x) = 0 \text{ for } (\mu - \pi_x \# \sigma) - \text{a.e. } x \in \mathbb{R}^N, \quad \psi(y) = 0 \text{ for } (\nu - \pi_y \# \sigma) - \text{a.e. } y \in \mathbb{R}^N
\]

and \( \phi(x) + \psi(y) + \lambda = c(x, y) \) for \( \sigma \)-a.e. \( (x, y) \in \mathbb{R}^N \times \mathbb{R}^N \).

The maximization problem on the right hand side of (2.7) is called dual partial Monge–Kantorovich (DPMK) problem.

Remark 2.3. See that the duality formulations (2.7) is different from Caffarelli-McCann's duality (see [12, Corollary 2.7]). In (2.7), \( \lambda \) is a variable and the duality is direct to the PMK problem. This formulation can be seen also as a minimax formulation of the problem. For numerical computation concerning the PMK problem, the formulation (2.7) with \( \lambda \) as a variable is very useful. This issue is discussed in [23].

We have a further structure of the duality (2.7) for the costs satisfying the triangle inequality.

Theorem 2.4. Under the assumptions and notations of Theorem 2.2, assume moreover that the cost function \( c \) satisfies the triangle inequality and \( c(x, x) = 0 \) for any \( x \in \mathbb{R}^N \). Then the DPMK problem can be rewritten as

\[
\mathcal{K}(\sigma^*) = \max \left\{ D(\lambda, u) := \int u d(\nu - \mu) + \lambda (m - \nu(\mathbb{R}^N)) : \lambda \geq 0 \text{ and } u \in L^\lambda_c \right\},
\]

where

\[
L^\lambda_c := \left\{ u \in \text{Lip}_c : 0 \leq u(x) \leq \lambda \text{ for any } x \in \mathbb{R}^N \right\}.
\]

In addition, \( \sigma \in \pi_m(\mu, \nu) \) and \( (\lambda, u) \in \mathbb{R}^+ \times L^\lambda_c \) are solutions of the PMK and of the DPMK (2.9), respectively, if and only if

\[
u(x) = 0 \text{ for } (\mu - \pi_x \# \sigma) - \text{a.e. } x \in \mathbb{R}^N, \quad u(x) = \lambda \text{ for } (\nu - \pi_y \# \sigma) - \text{a.e. } x \in \mathbb{R}^N
\]

and \( u(y) - u(x) = c(x, y) \) for \( \sigma \)-a.e. \( (x, y) \in \mathbb{R}^N \times \mathbb{R}^N \).

The proofs of Theorem 2.2 and Theorem 2.4 are given in Section 3.
2.3. Main results for Finsler distance costs. Coming back to the Finsler distance cost $d_F$, we introduce a new nonlinear PDE that we call the obstacle Monge–Kantorovich (OMK) equation. Then, we use this PDE to show the uniqueness of optimal active submeasures whenever the data $\mu$ and $\nu$ are absolutely continuous with respect to Lebesgue measure.

To introduce our PDE, we see that the dual formulation (2.9) may be written as

$$\max_{\lambda \geq 0} \left\{ \max_u \left\{ D(\lambda, u) : \ u \in L^\lambda_{d_F} \right\} \right\}.$$ 

Moreover, formally, for any fixed $\lambda \geq 0$, the Euler–Lagrange equation associated with the problem

$$\max_u \left\{ D(\lambda, u) : \ u \in L^\lambda_{d_F} \right\}$$

is given by the following PDE

$$\begin{cases}
\theta - \nabla \cdot \Phi = \nu - \mu & \text{in } D'(\mathbb{R}^N) \\
\Phi \cdot \nabla u = F(\cdot, \Phi) \\
u \in L^\lambda_{d_F}, \ \theta \in \partial II_{[0,\lambda]}(u).
\end{cases}$$

This is a double obstacle problem associated with the PMK problem (2.6) with $c = d_F$. And, formally we conclude that the study of the PMK is closely connected to the study of the dependence of a solution of $(P_\lambda)$ with respect to $\lambda$. Our aim now is to study this connection to get a characterization of optimal active submeasures of the PMK problem. Before going further, let us give the notion of solution to the OMK equation $(P_\lambda)$.

**Definition 2.5.** For a fixed $\lambda \geq 0$, a triplet $(\theta, \Phi, u) \in \mathcal{M}_b(\mathbb{R}^N) \times \mathcal{M}_b(\mathbb{R}^N; \mathbb{R}^N) \times \text{Lip}_{d_F}$ is said to be a solution to the OMK equation $(P_\lambda)$ if $u \in L^\lambda_{d_F}$ and we have

$$\begin{cases}
\theta - \nabla \cdot \Phi = \nu - \mu & \text{in } D'(\mathbb{R}^N) \\
\Phi \cdot \nabla u = F(\cdot, \Phi) \\
u = 0, \ \theta^- \text{-a.e. in } \mathbb{R}^N \ \text{and} \ u = \lambda, \ \theta^+ \text{-a.e. in } \mathbb{R}^N,
\end{cases}$$

where $\theta^\pm$ is the positive and negative part of the measure $\theta$ given by the Jordan decomposition.

Without abusing, we also say that a Radon measure $\theta \in \mathcal{M}_b(\mathbb{R}^N)$ is a solution of $(P_\lambda)$ if there exists $(\Phi, u) \in \mathcal{M}_b(\mathbb{R}^N; \mathbb{R}^N) \times \text{Lip}_{d_F}$ such that $(\theta, \Phi, u)$ satisfies the OMK equation $(P_\lambda)$.

To set the connection between the OMK equation and the optimal active submeasures, let us denote by $\mu \wedge \nu$ the measure of common mass of $\mu$ and $\nu$. Recall that if $\mu, \nu \in L^1(\mathbb{R}^N)$ then $\mu \wedge \nu \in L^1(\mathbb{R}^N)$ and

$$\mu \wedge \nu(x) = \min\{\mu(x), \nu(x)\} \ \text{for a.e. } x \in \mathbb{R}^N.$$ 

In general, the measure $\mu \wedge \nu$ is defined by (see [2])

$$\mu \wedge \nu(A) = \inf\{\mu(A_1) + \nu(A_2) : \text{disjoint Borel sets } A_1, A_2, \text{ such that } A_1 \cup A_2 = A\}.$$
Theorem 2.6 (Existence of a solution to the OMK equation). Given $\mu, \nu \in \mathcal{M}_b^+(\mathbb{R}^N)$ and $\lambda \geq 0$, the OMK equation $(P_\lambda)$ admits at least one solution $(\theta, \Phi, u)$. Moreover,

$$\theta^- \leq \mu - \mu \wedge \nu \leq \mu$$

and

$$\theta^+ \leq \nu - \mu \wedge \nu \leq \nu$$

for any solutions $(\theta, \Phi, u)$.

Because of the degeneracy of the OMK equation, the question of the uniqueness of a solution for $(P_\lambda)$ is delicate. In fact, one cannot in general expect the uniqueness of the components $\Phi$ and $u$ of solutions for the OMK equation $(P_\lambda)$. However, we can prove the uniqueness of the component $\theta$ whenever $\mu$ and $\nu$ are absolutely continuous with respect to the Lebesgue measure.

Theorem 2.7 (Uniqueness of $\theta$). Assume that $\mu, \nu \in L^1(\mathbb{R}^N)^+$. Let $\theta_1$ and $\theta_2$ be two solutions to the same OMK equation $(P_\lambda)$. Then $\theta_1, \theta_2 \in L^1(\mathbb{R}^N)$ and $\theta_1 = \theta_2$.

Now, we come to the connection between the OMK equation and the PMK problem.

Theorem 2.8 (Optimal active submeasures and OMK equation). Let $\mu, \nu \in \mathcal{M}_b^+(\mathbb{R}^N)$ be compactly supported.

(i) For any $\lambda \geq 0$ and $\theta_\lambda$ a solution of the OMK equation $(P_\lambda)$, the couple

$$(\rho_0, \rho_1) := (\mu - \theta^-_\lambda, \nu - \theta^+_\lambda)$$

is a couple of optimal active submeasures corresponding to $m_\lambda = (\mu - \theta^-_\lambda)(\mathbb{R}^N)$.

(ii) Conversely, if $(\rho_0, \rho_1) \in \text{Sub}_m(\mu, \nu)$ is a given couple of optimal active submeasures and $m \in [(\mu \wedge \nu)(\mathbb{R}^N), m_{\text{max}}]$ then for any $\lambda_m \geq 0$ such that

$$\lambda_m \in \arg \max_{\lambda \geq 0} \left\{ \max_u \left\{ D(\lambda, u) : u \in L^1_{dF} \right\} \right\},$$

the measure $\theta_{\lambda_m}$ defined by

$$\theta^-_{\lambda_m} := \mu - \rho_0 \quad \text{and} \quad \theta^+_{\lambda_m} := \nu - \rho_1$$

is a solution of the OMK equation $(P_{\lambda_m})$.

Following Theorems 2.8 and 2.7, we have the following result for the PMK problem.

Corollary 2.9 (Uniqueness of couple of optimal active submeasures). Let $\mu, \nu \in L^1(\mathbb{R}^N)^+$ be compactly supported and $m \in [(\| \mu \wedge \nu \|_{L^1}, m_{\text{max}}]$. There exists a unique couple of optimal active submeasures.

To end up this section of main results, we propose to study the maps that associate to each $\lambda \geq 0$ the corresponding optimal active submeasures and their total mass in the case $\mu, \nu \in L^1(\mathbb{R}^N)$. Thanks to Theorems 2.6, 2.8 and 2.7, for any $\lambda \geq 0$ there exist a unique mass $m_\lambda := (\mu - \theta^-_\lambda)(\mathbb{R}^N)$ and a unique couple of optimal active submeasures $(\rho_0^\lambda, \rho_1^\lambda) := (\mu - \theta^-_\lambda, \nu - \theta^+_\lambda)$ corresponding to $m_\lambda$. Let us define the maps

$$m : [0, \infty) \rightarrow [(\mu \wedge \nu)(\mathbb{R}^N), m_{\text{max}}]$$

$$\lambda \quad \rightarrow \quad m(\lambda) := m_\lambda$$
and
\[
\mathcal{R} : [0, \infty) \to L^1(\mathbb{R}^N) \times L^1(\mathbb{R}^N)
\]
\[
\lambda \to \mathcal{R}(\lambda) := (\rho_{0, \lambda}, \rho_{1, \lambda}).
\]

To simplify the presentation, let us denote
\[
\text{Sub}_{\text{opt}}(\mu, \nu) := \{(\rho_0, \rho_1) : \rho_0 \text{ and } \rho_1 \text{ are optimal active submeasures for some } m \in [\|\mu \wedge \nu\|_{L^1}, m_{\text{max}}]\}.
\]

**Theorem 2.10.** Let \(\mu, \nu \in L^1(\mathbb{R}^N)^+\) be compactly supported. We have that
(i) the map \( m \) is continuous, non-decreasing and surjective;
(ii) the map \( \mathcal{R} \) is continuous, non-decreasing and surjective from \([0, \infty)\) to \(\text{Sub}_{\text{opt}}(\mu, \nu)\).

**Remark 2.11.** (i) There is in general no uniqueness of optimal active submeasures when \( m < (\mu \wedge \nu)(\mathbb{R}^N) \). Indeed, in this case, all active submeasures \( \rho_0 \equiv \rho_1 \leq \mu \wedge \nu \) are optimal. This is not a contradiction with our PDE approach. Because there is no such an OMK equation with \( \lambda \geq 0 \) characterizing the PMK problem in this case.

(ii) In general, the uniqueness of optimal active submeasures does not hold true if both \( \mu \) and \( \nu \) are not in \( L^1(\mathbb{R}^N) \). For example, on \( \mathbb{R}^2 \), taking \( \mu = \delta_1 + \delta_3 \), \( \nu = \delta_2 \), where \( \delta_k \) is the Dirac mass at \( k \) in \( \mathbb{R}^2 \). Then all active submeasures are optimal for any \( m \).

(iii) We show that the uniqueness holds true whenever \( \mu, \nu \in L^1(\mathbb{R}^N) \) by using PDE techniques. We do not know if this remains to be true when one of \( \mu, \nu \) belongs to \( L^1(\mathbb{R}^N) \).

3. Kantorovich-type duality

The aim of this section is to prove Theorems 2.2 and 2.4.

**Proof of Theorem 2.2.** The existence of an optimal plan \( \sigma^* \in \pi_m(\mu, \nu) \) is standard which can be shown by Direct Method. Next, for any \( \sigma \in \pi_m(\mu, \nu) \) and \( (\lambda, \phi, \psi) \in \mathbb{R}^+ \times \mathcal{S}_c^\lambda(\mu, \nu) \), we have
\[
\int_{\mathbb{R}^N} \phi(x) \, d\mu(x) + \int_{\mathbb{R}^N} \psi(y) \, d\nu(y) + \lambda m \leq \int_{\mathbb{R}^N} \phi(x) \, d\pi_x \#\sigma + \int_{\mathbb{R}^N} \psi(y) \, d\pi_y \#\sigma + \lambda m
\]
\[
= \int_{\mathbb{R}^N \times \mathbb{R}^N} (\phi(x) + \psi(y) + \lambda) \, d\sigma
\]
\[
\leq \int_{\mathbb{R}^N \times \mathbb{R}^N} c(x, y) \, d\sigma.
\]
Hence,
\[
\sup \left\{ \int_{\mathbb{R}^N} \phi \, d\mu + \int_{\mathbb{R}^N} \psi \, d\nu + \lambda m : \lambda \in \mathbb{R}^+, (\phi, \psi) \in \mathcal{S}_c^\lambda(\mu, \nu) \right\} \leq \min_{\sigma \in \pi_m(\mu, \nu)} \mathcal{K}(\sigma).
\]

In order to prove the converse inequality, we add two points \( \hat{x} \in \mathbb{R}^N \setminus X \) and \( \hat{y} \in \mathbb{R}^N \setminus Y \) as extra production and consumption positions, respectively. Let us consider \( \hat{X} := X \cup \{\hat{x}\} \), \( \hat{Y} := Y \cup \{\hat{y}\} \) as metric spaces (induced by the Euclidean distance) and the measures on \( \hat{X} \) and \( \hat{Y} \) defined, respectively, by
\[ \hat{\mu} = \mu + (\nu(Y) - \mathbf{m})\delta_{\hat{y}} \quad \text{and} \quad \hat{\nu} = \nu + (\mu(X) - \mathbf{m})\delta_{\hat{x}}. \]

Obviously, \( \hat{\mu}(\hat{X}) = \hat{\nu}(\hat{Y}) \). Then, let us consider the extra cost on \( \hat{X} \times \hat{Y} \)

\[
\hat{c}(x, y) := \begin{cases} 
    c(x, y) & \text{if } (x, y) \in X \times Y \\
    0 & \text{if } x = \hat{x} \text{ or } y = \hat{y}.
\end{cases}
\]

From the assumptions on \( c \), we have that \( \hat{c} \) is l.s.c. and bounded on the compact metric space \( \hat{X} \times \hat{Y} \). Using Theorem 2.1,

\[
\min_{\hat{\gamma} \in \hat{\Pi}(\hat{\mu}, \hat{\nu})} \int_{\hat{X} \times \hat{Y}} \hat{c}(x, y) \, d\hat{\gamma} = \max_{(\hat{u}, \hat{v}) \in \hat{S}(\hat{\mu}, \hat{\nu})} \left( \int_{X} \hat{u} \, d\hat{\mu} + \int_{Y} \hat{v} \, d\hat{\nu}. \right)
\]

Fixed any \( \hat{\gamma} \in \hat{\Pi}(\hat{\mu}, \hat{\nu}) \), set \( \gamma_{1} := \hat{\gamma} \mathcal{L}_{X \times Y} \) the restricted measure of \( \hat{\gamma} \) on \( X \times Y \). It is easy to see that \( \pi_{x} \# \gamma_{1} \leq \mu, \pi_{y} \# \gamma_{1} \leq \nu \) and \( \gamma_{1}(X \times Y) \geq \mathbf{m} \). Let us define \( \gamma := \frac{\mathbf{m}}{\gamma_{1}(X \times Y)} \gamma_{1} \in \Pi_{\mathbf{m}}(\mu, \nu) \)

\[
\int_{X \times Y} c(x, y) \, d\gamma \leq \int_{\hat{X} \times \hat{Y}} \hat{c}(x, y) \, d\hat{\gamma} = \int_{\hat{X} \times \hat{Y}} \hat{c}(x, y) \, d\hat{\gamma}. \]

This implies that

\[
\min_{\gamma \in \Pi_{\mathbf{m}}(\mu, \nu)} \int_{X \times Y} c(x, y) \, d\gamma \leq \min_{\hat{\gamma} \in \hat{\Pi}(\hat{\mu}, \hat{\nu})} \int_{\hat{X} \times \hat{Y}} \hat{c}(x, y) \, d\hat{\gamma} = \max_{(\hat{u}, \hat{v}) \in \hat{S}_{\hat{\mu}}(\hat{\nu})} \left( \int_{X} \hat{u} \, d\hat{\mu} + \int_{Y} \hat{v} \, d\hat{\nu}. \right)
\]

To finish the proof, for any \( (\hat{u}, \hat{v}) \in \hat{S}_{\hat{\mu}}(\hat{\nu}) \), we can moreover assume that \( \hat{u}, \hat{v} \) have finite values.

Set \( u_{1} := \hat{u} + \hat{v}(\hat{y}), v_{1} := \hat{v} + \hat{u}(\hat{x}) \) and \( \lambda := -\hat{u}(\hat{x}) - \hat{v}(\hat{y}) \geq 0 \). Since \( \hat{u}(x) + \hat{v}(y) \leq \hat{c}(x, y) \), we see that \( u_{1} \leq 0 \) in \( X \), \( v_{1} \leq 0 \) in \( Y \) and \( u_{1}(x) + v_{1}(y) \leq c(x, y) - \lambda \) for any \( (x, y) \in X \times Y \). So, extending arbitrarily \( u_{1} \) and \( v_{1} \) up to \( \mathbb{R}^{N} \) such that \( (u_{1}, v_{1}) \in S_{\lambda}^{\gamma}(\mu, \nu) \), we get

\[
\int_{\hat{X}} \hat{u}(x) \, d\hat{\mu} + \int_{\hat{Y}} \hat{v}(y) \, d\hat{\nu} = \int_{X} \hat{u}(x) \, d\mu + \int_{Y} \hat{v}(y) \, d\nu + (\nu(Y) - \mathbf{m})\hat{u}(\hat{x}) + (\mu(X) - \mathbf{m})\hat{v}(\hat{y})
\]

\[
= \int_{X} (\hat{u}(x) + \hat{v}(\hat{y})) \, d\mu + \int_{Y} (\hat{v}(y) + \hat{u}(\hat{x})) \, d\nu - (\hat{u}(\hat{x}) + \hat{v}(\hat{y}))\mathbf{m}
\]

\[
= \int_{X} u_{1}(x) \, d\mu + \int_{Y} v_{1}(y) \, d\nu + \lambda\mathbf{m}.
\]

Thus

\[
\min_{\gamma \in \Pi_{\mathbf{m}}(\mu, \nu)} \int_{X \times Y} c(x, y) \, d\gamma \leq \max_{(\hat{u}, \hat{v}) \in \hat{S}_{\hat{\mu}}(\hat{\nu})} \left( \int_{X} \hat{u} \, d\hat{\mu} + \int_{Y} \hat{v} \, d\hat{\nu}. \right)
\]

\[
\leq \sup \left\{ \int_{\mathbb{R}^{N}} \phi \, d\mu + \int_{\mathbb{R}^{N}} \psi \, d\nu + \lambda\mathbf{m} : \lambda \geq 0, (\phi, \psi) \in S_{\lambda}^{\gamma}(\mu, \nu) \right\}.
\]
From the above arguments, the supremum is actually the maximum.

At last, by the duality (2.7), \( \sigma \in \pi_m(\mu, \nu) \) and \( (\lambda, \phi, \psi) \in \mathbb{R}^+ \times S^\lambda_c(\mu, \nu) \) are solutions of the PMK and of the DPMK, respectively, if and only if the two inequalities in (3.1) are equalities. This is equivalent to the optimality condition (2.8).

\[ \square \]

Now, we prove the duality for the case where the cost satisfies the triangle inequality.

**Proof of Theorem 2.4.** We see that
\[
\min_{\gamma \in \pi_m(\mu, \nu)} \int_{\mathbb{R}^N \times \mathbb{R}^N} c(x, y) d\gamma \geq \sup \left\{ D(\lambda, u) : \lambda \geq 0 \text{ and } u \in L^\lambda_c \right\}.
\]

Indeed, for any \( \gamma \in \pi_m(\mu, \nu) \) and \( u \in L^\lambda_c \), we have
\[
\int_{\mathbb{R}^N} u d(\nu - \mu) + \lambda(m - \nu(\mathbb{R}^N)) = \int_{\mathbb{R}^N} -u(x) d\mu + \int_{\mathbb{R}^N} (u(y) - \lambda) d\nu + \lambda m
\]
\[
\leq \int_{\mathbb{R}^N} -u d\pi_x \# \gamma + \int_{\mathbb{R}^N} (u(y) - \lambda) d\pi_y \# \gamma + \lambda m
\]
\[
\leq \int_{\mathbb{R} \times \mathbb{R}^N} c(x, y) d\gamma(x, y).
\]

Conversely, for a given \( \lambda \geq 0 \) and \( (\phi, \psi) \in S^\lambda_c(\mu, \nu) \), we consider
\[
u_1(x) := \sup_{y \in Y} (\psi(y) + \lambda - c(x, y)) \leq \lambda \text{ and } \nu(x) := \max\{\nu_1(x), 0\} \quad \forall x \in \mathbb{R}^N.
\]

We see that \( \nu \) is 1-Lipschitz with respect to \( c \) and \( -\nu \geq \phi \) and \( \nu(y) - \lambda \geq \psi(y) \) \( \forall y \in Y \) (where we use the condition \( c(y, y) = 0 \)). So
\[
\int_{\mathbb{R}^N} u d(\nu - \mu) + \lambda(m - \nu(\mathbb{R}^N)) \geq \int_{\mathbb{R}^N} -\nu d\mu + \int_{\mathbb{R}^N} \phi d\nu + \lambda m.
\]

By Theorem 2.2, the duality and the existence of a solution \( (\lambda^*, u^*) \) are proven. For the optimality condition (2.10), we use again the duality and (3.2) similarly to the case of general costs \( c \). \( \square \)

**Remark 3.12.** If \( c \) satisfies the triangle inequality and \( c(x, x) = 0 \) for any \( x \in \mathbb{R}^N \) then the DPMK problem can be also written as
\[
\max \left\{ \int_{\mathbb{R}^N} u d(\nu - \mu) + \lambda(m - \mu(\mathbb{R}^N)) : \lambda \in \mathbb{R}^+, \; u \in \text{Lip}_c, \; -\lambda \leq u \leq 0 \right\}.
\]

Indeed, in the construction of \( u \) from \( (\phi, \psi) \), we can take
\[
u_1(y) := \inf_{x \in X} (c(x, y) - \phi(x) - \lambda) \text{ and } \nu(y) := \min\{\nu_1(y), 0\} \quad \forall y \in \mathbb{R}^N.
\]
4. OMK equation

The aim of this section is to study the existence and uniqueness of solutions for the OMK equation \((P_\lambda)\). Besides this, we also show some estimates for solutions \(\theta\) of the OMK equation which are useful for later use. We will make use of variational techniques for the existence while the uniqueness and the estimates of \(\theta\) are shown by using PDE techniques. In this section, we do not really need the compactness of the supports of \(\mu\) and \(\nu\).

4.1. Existence of solution to the OMK equation. The existence of solution to the OMK equation is based on the dual approach. More precisely, by applying the Fenchel–Rockafellar dual theory to the problem (2.11), we introduce a minimum flow-type problem (for the minimum flow problem and some its variants, one can see [31, Chapter 4]). And then we show that the OMK equation is given by the optimality condition for the two problems.

**Proposition 4.13.** Let \(\mu, \nu \in \mathcal{M}_b^+ (\mathbb{R}^N)\) and \(\lambda \geq 0\) be fixed. We have
\[
\max_{u \in L^d_F}_{\mathbb{R}^N} \int_{\mathbb{R}^N} ud(\nu - \mu) = \min \left\{ \int_{\mathbb{R}^N} F(x, \Phi(x)) d\Phi + \lambda \int_{\mathbb{R}^N} d\theta : (\Phi, \theta^0, \theta^1) \in S \right\},
\]
where
\[
S := \left\{ (\Phi, \theta^0, \theta^1) \in \mathcal{M}_b (\mathbb{R}^N, \mathbb{R}^N) \times \mathcal{M}_b^+ (\mathbb{R}^N) \times \mathcal{M}_b^+ (\mathbb{R}^N) : -\nabla \cdot \Phi = \nu - \theta^1 - (\mu - \theta^0) \right\}.
\]

We need some elementary lemmas concerning the set \(\text{Lip}_d\) of 1-Lipschitz functions w.r.t \(d_F\).

**Lemma 4.1.** Let \(F\) be a continuous, nondegenerate Finsler metric and \(u \in \text{Lip}_d\). Setting \(u_{\varepsilon} := \rho_{\varepsilon} \ast u\), where \(\rho_{\varepsilon}\) is the standard mollifier on \(\mathbb{R}^N\). Then
\[
\limsup_{\varepsilon \to 0} \frac{F^*(x, Du_{\varepsilon}(x))}{1} \leq 1 \quad \text{for all} \quad x \in \mathbb{R}^N.
\]

**Proof.** Let \(x \in \mathbb{R}^N\) be fixed. There exists some \(\|\xi_{\varepsilon}\| = 1\) such that
\[
F^*(x, Du_{\varepsilon}(x)) = \frac{(Du_{\varepsilon}(x) \cdot \xi_{\varepsilon})}{F(x, \xi_{\varepsilon})} = \lim_{h \to 0^+} \frac{u_{\varepsilon}(x + h\xi_{\varepsilon}) - u_{\varepsilon}(x)}{F(x, h\xi_{\varepsilon})}
\]
\[
= \lim_{h \to 0^+} \int_{\mathbb{R}^N} \rho_{\varepsilon}(t) (u(x + h\xi_{\varepsilon} - t) - u(x - t)) dt.
\]
This implies that
\[
F^*(x, Du_{\varepsilon}(x)) \leq \limsup_{h \to 0^+} \int_{\mathbb{R}^N} \rho_{\varepsilon}(t) dF(x - t, x - t + h\xi_{\varepsilon}) dt
\]
\[
\leq \lim_{h \to 0^+} \int_{\mathbb{R}^N} \rho_{\varepsilon}(t) \int_0^1 F(x - t + \tau h\xi_{\varepsilon}, h\xi_{\varepsilon}) d\tau dt
\]
\[
= \int_{\mathbb{R}^N} \rho_{\varepsilon}(t) F(x - t, \xi_{\varepsilon}) dt \quad \text{for all} \quad x \in \mathbb{R}^N.
\]
On the other hand, there is a sequence \( \varepsilon_n \to 0 \) such that
\[
\limsup_{\varepsilon \to 0} F^*(x, Du_\varepsilon(x)) = \lim_{\varepsilon_n \to 0} F^*(x, Du_{\varepsilon_n}(x)).
\] (4.4)

Since \( \|\xi_{\varepsilon_n}\| = 1 \), up to a subsequence of \( \{\xi_{\varepsilon_n}\} \), we can assume moreover that \( \xi_{\varepsilon_n} \to \xi \) as \( \varepsilon_n \to 0 \). (4.5)

Thanks to (4.3), we get
\[
F^*(x, Du_{\varepsilon_n}(x)) \leq \int_{\mathbb{R}^N} \rho_{\varepsilon_n}(t) F(x - t, \xi_{\varepsilon_n}) \, dt \quad F(x, \xi_{\varepsilon_n}).
\] (4.6)

Let \( \varepsilon_n \to 0 \), using (4.4), (4.6) and (4.5), we obtain
\[
\limsup_{\varepsilon \to 0} F^*(x, Du_\varepsilon(x)) = \lim_{\varepsilon_n \to 0} F^*(x, Du_{\varepsilon_n}(x)) \leq \lim_{\varepsilon_n \to 0} \frac{\int_{\mathbb{R}^N} \rho_{\varepsilon_n}(t) F(x - t, \xi_{\varepsilon_n}) \, dt}{F(x, \xi_{\varepsilon_n})} = 1. \quad \square
\]

**Remark 4.14.** The lower semicontinuity of \( F \) is not enough to hold (4.2). Indeed, taking the lower semicontinuous, non-degenerate Finsler metric \( F \) on \( \mathbb{R} \) defined by
\[
F(x, \xi) = \begin{cases} |\xi| & \text{if } x \leq 0 \\ 2|\xi| & \text{if } x > 0 \end{cases} \quad \text{for } x, \xi \in \mathbb{R}
\]
and \( u \) is 1-Lipschitz w.r.t. \( d_F \) given by
\[
u(x) = \begin{cases} x & \text{if } x \leq 0 \\ 2x & \text{if } x > 0 \end{cases} \quad \text{for } x \in \mathbb{R}.
\]
Then,
\[
F^*(x, p) = \begin{cases} |p| & \text{if } x \leq 0 \\ \frac{1}{2} |p| & \text{if } x > 0 \end{cases} \quad \text{and } u'(x) = \int_{\mathbb{R}} \rho_{\varepsilon}(s) u'(x - s) ds.
\]
Therefore, \( u'(0) = \int_{[s \geq 0]} \rho_{\varepsilon}(s) ds + 2 \int_{[s < 0]} \rho_{\varepsilon}(s) ds = \frac{3}{2} \) and \( F^*(0, u'(0)) = \frac{3}{2} > 1 \).

It is known that if \( u \in C^1(\mathbb{R}^N) \) then
\[
u(y) - \nu(x) \leq d_F(x, y) \quad \forall x, y \in \mathbb{R}^N \text{ (i.e., } u \in \text{Lip}_{d_F}) \text{ if and only if } F^*(x, \nabla \nu(x)) \leq 1 \quad \forall x \in \mathbb{R}^N.
\]
The latter is equivalent to
\[
q \cdot \nabla \nu(x) \leq F(x, q) \quad \forall x \in \mathbb{R}^N, \forall q \in \mathbb{R}^N.
\]
In the case where \( u \) is non-smooth, we have the characterization via the tangential gradient.

**Lemma 4.2.** For any \( u \in \text{Lip}_{d_F} \) and \( \Phi \in \mathcal{M}_b(\mathbb{R}^N; \mathbb{R}^N) \) such that \( \nabla \cdot \Phi \in \mathcal{M}_b(\mathbb{R}^N) \), we have
\[
\frac{\Phi}{|\Phi|}(x) \cdot \nabla \Phi \nu(x) \leq F(x, \frac{\Phi}{|\Phi|}(x)) \quad |\Phi|-a.e. \quad x \in \mathbb{R}^N.
\]
Proof. Taking $u_\varepsilon$ as in Lemma 4.1, for any Borel subset $B$, we have

$$\int_B \frac{\Phi}{|\Phi|} \cdot \nabla |\Phi| u d|\Phi| = \lim_{\varepsilon \to 0} \int_B \frac{\Phi}{|\Phi|} (x) \cdot \nabla u_\varepsilon (x) d|\Phi| \leq \limsup_{\varepsilon \to 0} \int_B F^*(x, \nabla u_\varepsilon (x)) F(x, \frac{\Phi}{|\Phi|} (x)) d|\Phi|(x).$$

Letting $\varepsilon \to 0$, using again Fatou’s Lemma and Lemma 4.1, we get

$$\int_B \frac{\Phi}{|\Phi|} |\Phi| (x) \cdot \nabla |\Phi| u d|\Phi| \leq \int B F^*(x, \frac{\Phi}{|\Phi|} (x)) d|\Phi|.$$

The proof ends up by the arbitrariness of Borel set $B$. \hfill \Box

Proof of Proposition 4.13. The case $\lambda = 0$ is obvious. Let us now assume that $\lambda > 0$.

1. We show that

$$\max_{u \in L^\lambda_{d\rho} \mathbb{R}^N} \int_{\mathbb{R}^N} u d(\nu - \mu) \leq \inf \left\{ \int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|} (x)) d|\Phi| + \lambda \int_{\mathbb{R}^N} d\theta^1 : (\Phi, \theta^0, \theta^1) \in S \right\}.$$

Fix any $u \in L^\lambda_{d\rho}$ and $(\Phi, \theta^0, \theta^1) \in S$. Taking $u$ as a test function in the equation $-\nabla \cdot \Phi = \nu - \theta^1 - (\mu - \theta^0)$, using Lemma 4.2, we have

$$\int_{\mathbb{R}^N} u d(\nu - \mu) = \int_{\mathbb{R}^N} \frac{\Phi}{|\Phi|} \nabla |\Phi| u d|\Phi| + \int_{\mathbb{R}^N} u d\theta^1 - \int_{\mathbb{R}^N} u d\theta^0$$

$$\leq \int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|} (x)) d|\Phi| + \lambda \int_{\mathbb{R}^N} d\theta^1.$$

So

$$\sup_{u \in L^\lambda_{d\rho} \mathbb{R}^N} \int_{\mathbb{R}^N} u d(\nu - \mu) \leq \inf \left\{ \int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|} (x)) d|\Phi| + \lambda \int_{\mathbb{R}^N} d\theta^1 : (\Phi, \theta^0, \theta^1) \in S \right\}.$$

It is not difficult to see that the supremum is actually a maximum by the direct method.

2. Obviously, we have

$$\max \left\{ \int_{\mathbb{R}^N} u d(\nu - \mu) : u \in L^\lambda_{d\rho} \right\} \geq \sup \left\{ \int_{\mathbb{R}^N} u d(\nu - \mu) : u \in L^\lambda_{d\rho}, u \in C^{1,1}(\mathbb{R}^N) \right\}.$$

It remains to show that

$$\sup \left\{ \int_{\mathbb{R}^N} u d(\nu - \mu) : u \in C^{1,1}(\mathbb{R}^N) \cap L^\lambda_{d\rho} \right\} = \min \left\{ \int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|} (x)) d|\Phi| + \lambda \int_{\mathbb{R}^N} d\theta^1 : (\Phi, \theta^0, \theta^1) \in S \right\}. \tag{4.7}$$
On the other hand,
\[
\sup \left\{ \int_{\mathbb{R}^N} u d(\nu - \mu) : u \in C^{1,1}(\mathbb{R}^N) \cap L^\lambda_{d_F} \right\}
\]
\[
= \sup \left\{ \int_{\mathbb{R}^N} u d(\nu - \mu) : u \in C^{1,1}(\mathbb{R}^N), F^*(x, \nabla u(x)) \leq 1, 0 \leq u(x) \leq \lambda \forall x \in \mathbb{R}^N \right\}
\]
\[
= -\inf_{u \in V} \left\{ \mathcal{F}(u) + \mathcal{G}(\Lambda u) \right\},
\]
where
\[
\mathcal{F}(u) := -\int_{\mathbb{R}^N} u d(\nu - \mu) \quad \forall u \in V := C^{1,1}(\mathbb{R}^N) \cap C_b(\mathbb{R}^N),
\]
\[
\Lambda(u) = (\nabla u, -u, u) \in Z := C_b(\mathbb{R}^N; \mathbb{R}^N) \times C_b(\mathbb{R}^N) \times C_b(\mathbb{R}^N)
\]
and, for all \((q, z, w) \in Z,
\[
\mathcal{G}(q, z, w) := \begin{cases}
0 & \text{if } z(x) \leq 0, w(x) \leq \lambda \text{ and } F^*(x, q(x)) \leq 1 \forall x \in \mathbb{R}^N \\
+\infty & \text{otherwise}.
\end{cases}
\]
We use the \(W^{1,\infty}\)-norm and \(L^\infty\)-norm for the spaces \(V\) and \(Z\), respectively, i.e.,
\[
\|u\|_V := \|u\|_{L^\infty} + \|\nabla u\|_{L^\infty} \quad \text{and} \quad \|(q, z, w)\|_Z := \|q\|_{L^\infty} + \|z\|_{L^\infty} + \|w\|_{L^\infty}.
\]

Now, applying the Fenchel–Rockafellar dual theory (see e.g. [17], Chapter III, Theorem 4.1 with the choice \(u_0 = \frac{\lambda}{2}\) there. Note that the assumption \(\lambda > 0\) is used in this step), we have
\[
\inf_{u \in V} \mathcal{F}(u) + \mathcal{G}(\Lambda(u))
\]
\[
= \max_{(\Phi, \theta^0, \theta^1) \in M_b(\mathbb{R}^N; \mathbb{R}^N) \times M_b(\mathbb{R}^N) \times M_b(\mathbb{R}^N)} \left( -\mathcal{F}^*(-\Lambda^*(\Phi, \theta^0, \theta^1)) - \mathcal{G}^*(\Phi, \theta^0, \theta^1) \right).
\]
The proof of (4.7) is completed by computing explicitly the quantities in this maximization problem. For completeness, let us give the results of this computation.

- Since \(\mathcal{F}\) is linear, \(\mathcal{F}^*(-\Lambda^*(\Phi, \theta^0, \theta^1))\) is finite (and is always equal to 0) if and only if
  \[
  \langle -\Lambda^*(\Phi, \theta^0, \theta^1), u \rangle = \mathcal{F}(u) = -\int_{\mathbb{R}^N} u d(\nu - \mu) \quad \text{for any } u \in V,
  \]
or equivalently
  \[
  \langle \Phi, \nabla u \rangle - \langle \theta^0, u \rangle + \langle \theta^1, u \rangle = \langle \nu - \mu, u \rangle \quad \text{for any } u \in V.
  \]
This means that
  \[
  -\nabla \cdot \Phi = \nu - \theta^1 - (\mu - \theta^0) \quad \text{in } \mathcal{D}'(\mathbb{R}^N).
  \]
For $G^*(\Phi,\theta^0,\theta^1)$, we have

$$
G^*(\Phi,\theta^0,\theta^1) = \sup_{q \in C_b(\mathbb{R}^N;\mathbb{R}^N): F^*(x,q(x)) \leq 1, \forall x \in \mathbb{R}^N} \langle \Phi, q \rangle + \sup_{z \in C_b(\mathbb{R}^N): z \leq 0} \langle \theta^0, z \rangle + \sup_{w \in C_b(\mathbb{R}^N): w \leq \lambda} \langle \theta^1, w \rangle
$$

$$
= \begin{cases}
\int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|}(x)) |\Phi| + \lambda \int_{\mathbb{R}^N} d\theta^1 & \text{if } \theta^0 \geq 0 \text{ and } \theta^1 \geq 0 \\
+\infty & \text{otherwise}
\end{cases}
$$

}\Box

**Proposition 4.15.** Given $\mu,\nu \in \mathcal{M}_b^+(\mathbb{R}^N)$ and $\lambda \geq 0$. We have that

(i) if $u$ and $(\Phi,\theta^0,\theta^1)$ are solutions for the duality \((4.1)\) then $(\theta,\Phi,u) := (\theta^1 - \theta^0,\Phi,u)$ is a solution to the OMK equation \((P_\lambda)\). Moreover $\theta^+ = \theta^1$, $\theta^- = \theta^0$ if $\lambda > 0$.

(ii) Conversely, if $(\theta,\Phi,u)$ is a solution to the OMK equation \((P_\lambda)\) then $u$ and $(\Phi,\theta^0,\theta^1) := (\Phi,\theta^-,\theta^+) \in \mathcal{M}_b^+(\mathbb{R}^N)$ are solutions for the duality \((4.1)\).

**Proof.** (i) Let $u \in L^2_{\text{loc}}$ and $(\Phi,\theta^0,\theta^1) \in S$ be solutions for the duality \((4.1)\). Then $(\theta,\Phi,u) := (\theta^1 - \theta^0,\Phi,u)$ is a solution to the OMK equation \((P_\lambda)\). Indeed, we have

$$
\theta - \nabla \cdot \Phi = \nu - \mu \text{ in } \mathcal{D}'(\mathbb{R}^N)
$$

and

$$
\int_{\mathbb{R}^N} u d(\nu - \mu) = \int_{\mathbb{R}^N} \frac{\Phi}{|\Phi|} \nabla_{|\Phi|} u |\Phi| + \int_{\mathbb{R}^N} u d\theta^1 - \int_{\mathbb{R}^N} u d\theta^0
$$

$$
\leq \int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|}(x)) |\Phi| + \lambda \int_{\mathbb{R}^N} d\theta^1 \text{ (by Proposition 4.2)}.
$$

From the optimality of $u$ and $(\Phi,\theta^0,\theta^1)$, using Proposition 4.13, we have that

$$
\frac{\Phi}{|\Phi|}(x) \nabla_{|\Phi|} u(x) = F(x, \frac{\Phi}{|\Phi|}(x)), |\Phi|-\text{a.e. } x,
$$

$$
u = 0, \theta^0 \text{-a.e. and } u = \lambda, \theta^1 \text{-a.e.}.
$$

By the Jordan decomposition, we get $\theta^+ \leq \theta^1$, $\theta^- \leq \theta^0$ and thus

$$u = 0, \theta^- \text{-a.e. and } u = \lambda, \theta^+ \text{-a.e.}.
$$

So $(\theta,\Phi,u)$ is a solution to the OMK equation \((P_\lambda)\). It remains to verify that $\theta^- = \theta^0$ and $\theta^+ = \theta^1$ in the case $\lambda > 0$. Since $\lambda > 0$, we deduce that $\theta^0$ and $\theta^1$ are concentrated on two disjoint sets. Thus $\theta^+ = \theta^1$ and $\theta^- = \theta^0$ by the Jordan decomposition.

(ii) Conversely, assume that $(\theta,\Phi,u)$ is a solution to the OMK equation \((P_\lambda)\). We see that

$$
\int_{\mathbb{R}^N} u d(\nu - \mu) = \int_{\mathbb{R}^N} \frac{\Phi}{|\Phi|} \nabla_{|\Phi|} u |\Phi| + \int_{\mathbb{R}^N} u d\theta
$$

$$
= \int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|}(x)) |\Phi| + \int_{\mathbb{R}^N} \lambda d\theta^+.
$$
The optimality of \( u \) and \( (\Phi, \theta^-, \theta^+) \) follows immediately from the duality (4.1).

We have the following estimates for solutions \( \theta \) of the OMK equation.

**Proposition 4.16** (Estimate of solutions \( \theta \)). Given \( \mu, \nu \in \mathcal{M}_b^+(\mathbb{R}^N) \) and \( \lambda \geq 0 \). Let \( (\theta, \Phi, u) \) be a solution to the OMK equation \((P_\lambda)\). Then

\[
\theta^- \leq \mu - \mu \land \nu \leq \mu \quad \text{and} \quad \theta^+ \leq \nu - \mu \land \nu \leq \nu.
\]

**Proof.**

**Case 1:** If \( \lambda = 0 \), then \( u \equiv 0 \), \( \Phi \equiv 0 \) and

\[
\theta \equiv \nu - \mu = \nu - \mu \land \nu - (\mu - \mu \land \nu).
\]

By the Jordan decomposition, \( \theta^+ \leq \nu - \mu \land \nu \) and \( \theta^- \leq \mu - \mu \land \nu \).

**Case 2:** Let us now assume that \( \lambda > 0 \). For \( 0 < \varepsilon < \lambda \), let us consider the Lipschitz continuous functions of one variable

\[
T_\varepsilon^1(r) := \begin{cases} 
0 & \text{if } r \leq \lambda - \varepsilon \\
\frac{r - (\lambda - \varepsilon)}{\varepsilon} & \text{if } \lambda - \varepsilon \leq r \leq \lambda, \quad \forall r \in \mathbb{R}. \\
1 & \text{if } r \geq \lambda
\end{cases}
\]

For \( \xi \in C_c^\infty(\mathbb{R}^N) \) such that \( \xi \geq 0 \), we take \( T_\varepsilon^1(u)\xi \) as a test function in the equation \( \theta - \nabla \cdot \Phi = \nu - \mu \). We get

\[
\int T_\varepsilon^1(u)\xi \, d\theta + \int \frac{\Phi}{|\Phi|} \cdot \nabla|\Phi| (T_\varepsilon^1(u)\xi) \, d|\Phi| = \int T_\varepsilon^1(u)\xi \, d(\nu - \mu). \tag{4.8}
\]

Thanks to Lemma 7.5 (see Appendix), we get

\[
\int \frac{\Phi}{|\Phi|} \cdot \nabla|\Phi| (T_\varepsilon^1(u)\xi) \, d|\Phi| = \int (T_\varepsilon^1)'(u)\nabla|\Phi|u \cdot \frac{\Phi}{|\Phi|} \xi \, d|\Phi| + \int \frac{\Phi}{|\Phi|} \cdot \nabla \xi T_\varepsilon^1(u) \, d|\Phi| \geq \int \frac{\Phi}{|\Phi|} \cdot \nabla \xi T_\varepsilon^1(u) \, d|\Phi|. \tag{4.9}
\]

Using (4.8) and (4.9), we see that

\[
\int T_\varepsilon^1(u)\xi \, d\theta + \int \frac{\Phi}{|\Phi|} \cdot \nabla \xi T_\varepsilon^1(u) \, d|\Phi| \leq \int T_\varepsilon^1(u)\xi \, d(\nu - \mu) = \int T_\varepsilon^1(u)\xi \, d(\nu - \mu \land \nu - (\mu - \mu \land \nu)) \tag{4.10}
\]

\[
\leq \int T_\varepsilon^1(u)\xi \, d(\nu - \mu \land \nu).
\]

Since \( u \leq \lambda \), for any \( x \in \mathbb{R}^N \), we have

\[
T_\varepsilon^1(u)(x) \to \chi_{[u=\lambda]}(x) \quad \text{as } \varepsilon \to 0.
\]

Now, using Lemma 7.5 (ii), the non-degeneracy of \( F \) and the definition of solution for \((P_\lambda)\), we have \(|\Phi|([u=\lambda]) = 0 \) (i.e. \( \Phi \) gives no mass on the set \([u=\lambda]\)). This implies that

\[
\int \frac{\Phi}{|\Phi|} \cdot \nabla \xi T_\varepsilon^1(u) \, d|\Phi| \to 0 \quad \text{as } \varepsilon \to 0.
\]
Letting $\varepsilon \to 0$ in (4.10), we get
\[
\int_{|u=\lambda|} \xi d\theta \leq \int_{|u=\lambda|} \xi d(\nu - \mu \wedge \nu) \quad \text{for any } \xi \in C_c^\infty(\mathbb{R}^N), \xi \geq 0.
\]
Using the definition of solution for $(P_\lambda)$, we have $u = 0$ for $\theta^-$-a.e. Since $\lambda > 0$, we deduce that
\[
\int_{|u=\lambda|} \xi d\theta^+ = \int_{|u=\lambda|} \xi d\theta \leq \int_{|u=\lambda|} \xi d(\nu - \mu \wedge \nu) \quad \text{for any } \xi \in C_c^\infty(\mathbb{R}^N), \xi \geq 0.
\]
This implies that $\theta^+ \leq \nu - \mu \wedge \nu$ on $|u=\lambda|$ and that $\theta^+ \leq \nu - \mu \wedge \nu$ (since $\theta^+$ is concentrated on $|u=\lambda|$). At last, using $T_\varepsilon^2(u)\xi$ as a test function in the equation $\theta - \nabla \cdot \Phi = \nu - \mu$, we can prove in the same way that $\theta^- \leq \mu - \mu \wedge \nu$.

Proof of Theorem 2.6. The proof follows directly from Propositions 4.13, 4.15 and 4.16.

As a consequence of Proposition 4.13, we have the following result that will be useful later.

Corollary 4.17. Let $\mu, \nu \in M_0^+(\mathbb{R}^N)$ be such that $\nu(\mathbb{R}^N) \leq \mu(\mathbb{R}^N)$. We have
\[
\sup \left\{ \int_{\mathbb{R}^N} ud(\nu - \mu) : u \in \text{Lip}_{d_F}, u \geq 0 \right\} = \min_{(\Phi, \theta^0) \in M_b(\mathbb{R}^N, \mathbb{R}^N) \times M_b^+(\mathbb{R}^N)} \left\{ \int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|}(x))d|\Phi| : -\nabla \cdot \Phi = \nu - (\mu - \theta^0) \right\}.
\]

Proof. Using the assumption $\nu(\mathbb{R}^N) \leq \mu(\mathbb{R}^N)$, there exists $(\tilde{\Phi}, \tilde{\theta}^0) \in M_b(\mathbb{R}^N, \mathbb{R}^N) \times M_b^+(\mathbb{R}^N)$ such that $-\nabla \cdot \tilde{\Phi} = \nu - (\mu - \tilde{\theta}^0)$. This implies that
\[
\inf_{(\Phi, \theta^0) \in M_b(\mathbb{R}^N, \mathbb{R}^N) \times M_b^+(\mathbb{R}^N)} \left\{ \int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|}(x))d|\Phi| : -\nabla \cdot \Phi = \nu - (\mu - \theta^0) \right\} := C < +\infty.
\]
Now, taking $u$ as a test function in the equation $-\nabla \cdot \Phi = \nu - (\mu - \theta^0)$, we get
\[
\int_{\mathbb{R}^N} ud(\nu - \mu) = \int_{\mathbb{R}^N} \frac{\Phi}{|\Phi|} \nabla |\Phi| ud|\Phi| - \int_{\mathbb{R}^N} ud\theta^0 \leq \int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|}(x))d|\Phi|.
\]
Thus, up to a subsequence, $M$ the lower semicontinuity of the functional

$$\text{It is not difficult to see that therein). It uses mainly the following result.}$$

variable technique (the technique was known in PDEs, due to [26, Theorem 2.38]) and passing to the limit in (4.12), we obtain

$$\int F(x, \frac{\Phi_n}{|\Phi_n|}(x))d|\Phi_n| + \lambda_n \int \mu d(\nu - \mu)$$

Conversely, let us consider a sequence $\lambda_n \to +\infty$ as $n \to +\infty$. Thanks to Proposition 4.13, there exist $u_n \in L_{d_i}^\lambda$ and $(\theta_n^0, \theta_n^1) \in S$ such that

$$\int F(x, \frac{\Phi_n}{|\Phi_n|}(x))d|\Phi_n| + \lambda_n \int \mu d(\nu - \mu)$$

It is not difficult to see that $\{(\Phi_n, \theta_n^0, \theta_n^1)\}$ is bounded in $M_b(\mathbb{R}^N; \mathbb{R}^N) \times M_b(\mathbb{R}^N) \times M_b(\mathbb{R}^N)$. Thus, up to a subsequence, $(\Phi_n, \theta_n^0, \theta_n^1)$ converges to some $(\Phi, \theta^0, \theta^1)$ weakly* in $M_b(\mathbb{R}^N; \mathbb{R}^N) \times M_b(\mathbb{R}^N) \times M_b(\mathbb{R}^N)$. It is clear that $\theta^1 = 0$, $\theta^0 \geq 0$ and $-\nabla \cdot \Phi = \nu - (\mu - \theta^0)$. Now, using the lower semicontinuity of the functional $\int F(x, \frac{\Phi}{|\Phi|}(x))d|\Phi|$ w.r.t. the weak* convergence in variable $\Phi$ (see e.g. [2, Theorem 2.38]) and passing to the limit in (4.12), we obtain

$$\int F(x, \frac{\Phi_n}{|\Phi_n|}(x))d|\Phi_n| \leq \lim_{n \to +\infty} \int F(x, \frac{\Phi_n}{|\Phi_n|}(x))d|\Phi_n| \leq \sup \{ \int ud(\nu - \mu) : u \in Lip_{d_i}, u \geq 0 \}.$$

The proof is completed by combining this with (4.11). \qed

4.2. Uniqueness of solution $\theta$ to the OMK equation. We usually identify a measure with its density function with respect to Lebesgue measure $L^N$ when the measure is absolutely continuous w.r.t. $L^N$. In this subsection, we focus on the proof of the uniqueness for the solution $\theta$ of the OMK equation $(P_\lambda)$ which is then used to show the uniqueness of optimal active submeasures for the PMK problem. The result of uniqueness is somehow optimal in view of Theorem 2.8 and Remark 2.11 (ii). Our proof will be based on the doubling and de-doubling variable technique (the technique was known in PDEs, due to [26], see also [13] and the references therein). It uses mainly the following result.

**Lemma 4.3.** Let $\lambda \geq 0$ and $\mu, \nu \in L^1(\mathbb{R}^N)^+$. Suppose that $(\theta_i, \Phi_i, u_i), i = 1, 2,$ are solutions to the same OMK equation $(P_\lambda)$. Then $\theta_1, \theta_2 \in L^1(\mathbb{R}^N)$ and, for any $\xi \in C_c^\infty(\mathbb{R}^N \times \mathbb{R}^N)$ such that $\xi \geq 0$, we have

$$\int F(x, \frac{\Phi_i}{|\Phi_i|}(x))d|\Phi_i| \leq \lim_{n \to +\infty} \int F(x, \frac{\Phi_i}{|\Phi_i|}(x))d|\Phi_i| \leq \sup \{ \int ud(\nu - \mu) : u \in Lip_{d_i}, u \geq 0 \}.$$
\[
\int_{\mathbb{R}^N} \int_{\mathbb{R}^N} (\theta_1(x) - \theta_2(y))^+ \xi(x, y) \, dx \, dy \leq \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} |(\nabla_x \xi + \nabla_y \xi)| |d| \Phi_1|(x) \, dy \\
+ \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} |(\nabla_x \xi + \nabla_y \xi)| |d| \Phi_2|(y) \, dx \\
+ \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} |(\nu - \mu)(x) - (\nu - \mu)(y)| \xi(x, y) \, dx \, dy.
\] (4.13)

Before giving the proof of this lemma, let us show how it enables us to prove the main result of uniqueness in Subsection 2.3.

**Proof of Theorem 2.7.** Fixed any \( \alpha \in C^\infty_c(\mathbb{R}^N) \), \( \alpha \geq 0 \), let us choose

\[
\xi_\varepsilon(x, y) := \rho_\varepsilon(x - y) \alpha(x + y)
\]
as test functions in (4.13). Note that \( \nabla_x \xi_\varepsilon + \nabla_y \xi_\varepsilon = 2\rho_\varepsilon(x - y) \nabla \alpha(x + y) \). We have

\[
\int_{\mathbb{R}^N} \int_{\mathbb{R}^N} |\nabla_x \xi_\varepsilon + \nabla_y \xi_\varepsilon| |d| \Phi_1|(x) \, dy = \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} |\nabla_x \xi_\varepsilon + \nabla_y \xi_\varepsilon| |dy| |d| \Phi_1|(x)
\]
\[
= 2 \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} \rho_\varepsilon(x - y) |\nabla \alpha(x + y)| |dy| |d| \Phi_1|(x)
\]
\[
= 2 \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} \rho_\varepsilon(t) |\nabla \alpha(2x - t)| |dt| |d| \Phi_1|(x)
\]
\[
\to 2 \int_{\mathbb{R}^N} |\nabla \alpha(2x)| |d| \Phi_1|(x).
\]

Similarly, \( \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} |\nabla_x \xi_\varepsilon + \nabla_y \xi_\varepsilon| |d| \Phi_2|(y) \, dx \to 2 \int_{\mathbb{R}^N} |\nabla \alpha(2y)| |d| \Phi_2|(y) \). Next, since \( f := \nu - \mu \in L^1 \), we have

\[
\int_{\mathbb{R}^N} \int_{\mathbb{R}^N} |f(x) - f(y)| \xi_\varepsilon(x, y) \, dx \, dy \leq \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} |f(x) - f(y)| \rho_\varepsilon(x - y) \alpha(x + y) \, dx \, dy
\]
\[
\leq ||\alpha||_\infty \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} |f(x) - f(y)| \rho_\varepsilon(x - y) \, dy \, dx
\]
\[
= ||\alpha||_\infty \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} |f(x) - f(x - t)| \rho_\varepsilon(t) \, dt \, dx
\]
\[
= ||\alpha||_\infty \int_{\mathbb{R}^N} F_\varepsilon(x) \, dx \to 0,
\]
by the fact that $F_\varepsilon(x) := \int_{\mathbb{R}^N} |f(x) - f(x-t)|\rho_\varepsilon(t) \, dt$, and $F_\varepsilon \to 0$ in $L^1$. Thus (4.13) leads to

$$\int_{\mathbb{R}^N} (\theta_1(x) - \theta_2(x))^+ \alpha(2x) \, dx \leq 2 \int_{\mathbb{R}^N} |\nabla \alpha(2x)| \Phi_1(x) + 2 \int_{\mathbb{R}^N} |\nabla \alpha(2x)| \Phi_2(y). \quad (4.14)$$

Taking a sequence $\alpha_n \in C^\infty_c(\mathbb{R}^N)$ such that $\chi_{B(0,n)} \leq \alpha_n \leq \chi_{B(0,n+1)}$ and $|\nabla \alpha_n| \leq C$. Substituting $\alpha_n$ into (4.14) and letting $n \to +\infty$, using the finiteness of $\Phi_1$, we get $\int_{\mathbb{R}^N} (\theta_1(x) - \theta_2(x))^+ \, dx \leq 0$. Hence $\theta_1 \leq \theta_2$. Since $\theta_1$ and $\theta_2$ have the same role, we obtain $\theta_1 = \theta_2$. \hfill \Box

Now, we give the proof of Lemma 4.3. Let us consider the Lipschitz continuous function

$$H_\varepsilon(r) := \min\left(r^+ / \varepsilon, 1\right) \quad \text{for any } r \in \mathbb{R}.$$

**Proof of Lemma 4.3.** Thanks to Proposition 4.16, we have $\theta_1, \theta_2 \in L^1(\mathbb{R}^N)$. Let us consider the test functions $\xi_\varepsilon(x, y) := H_\varepsilon(u_1(x) - u_2(y) + \varepsilon \rho(x, y))\xi(x, y)$ where $\xi \in C^\infty_c(\mathbb{R}^N \times \mathbb{R}^N)$, $\xi \geq 0$, $\rho \in C^\infty_c(\mathbb{R}^N \times \mathbb{R}^N)$ and $0 \leq \rho \leq 1$. For each $y$, considering $\xi_\varepsilon(\cdot, y)$ as a test function, we have

$$\int_{\mathbb{R}^N} H_\varepsilon(u_1(x) - u_2(y) + \varepsilon \rho(x, y))\xi(x, y)\theta_1(x) \, dx$$

$$+ \int_{\mathbb{R}^N} \frac{\Phi_1}{|\Phi_1|} \cdot \nabla \Phi_1 \cdot \left(H_\varepsilon(u_1(x) - u_2(y) + \varepsilon \rho(x, y))\xi(x, y)\right) \, d|\Phi_1|(x)$$

$$= \int_{\mathbb{R}^N} H_\varepsilon(u_1(x) - u_2(y) + \varepsilon \rho(x, y))\xi(x, y) \, (\nu - \mu) \, dx.$$

Integrating with respect to $y$, we get

$$\int_{\mathbb{R}^N} \int_{\mathbb{R}^N} H_\varepsilon(u_1(x) - u_2(y) + \varepsilon \rho(x, y))\xi(x, y)\theta_1(x) \, dx \, dy$$

$$+ \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} \frac{\Phi_1}{|\Phi_1|} \cdot \nabla \Phi_1 \cdot \left(H_\varepsilon(u_1(x) - u_2(y) + \varepsilon \rho(x, y))\xi(x, y)\right) \, d|\Phi_1|(x) \, dy \quad (4.15)$$

$$= \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} H_\varepsilon(u_1(x) - u_2(y) + \varepsilon \rho(x, y))\xi(x, y) \, (\nu - \mu) \, dx \, dy.$$

Similarly, applying for $(\theta_2, \Phi_2, u_2)$, we get
\[
\int \int_{\mathbb{R}^N \times \mathbb{R}^N} H_{\varepsilon}(u_1(x) - u_2(y) + \varepsilon \rho(x, y)) \xi(x, y) \theta_2(y) \, dy \, dx \\
+ \int \int_{\mathbb{R}^N \times \mathbb{R}^N} \frac{\Phi_2}{|\Phi_2|}(y) \nabla |\Phi_2|_y (H_{\varepsilon}(u_1(x) - u_2(y) + \varepsilon \rho(x, y)) \xi(x, y)) \, d|\Phi_2|(y) \, dx \\
= \int \int_{\mathbb{R}^N \times \mathbb{R}^N} H_{\varepsilon}(u_1(x) - u_2(y) + \varepsilon \rho(x, y)) \xi(x, y) (\nu - \mu)(y) \, dy \, dx.
\] (4.16)

From (4.15) and (4.16), we have

\[
I_1(\varepsilon) + I_2(\varepsilon) + I_3(\varepsilon) = 0,
\]

where

\[
I_1(\varepsilon) := \int \int_{\mathbb{R}^N \times \mathbb{R}^N} H_{\varepsilon}(u_1(x) - u_2(y) + \varepsilon \rho(x, y)) \xi(x, y) (\theta_1(x) - \theta_2(y)) \, dx \, dy \\
- \int \int_{\mathbb{R}^N \times \mathbb{R}^N} H_{\varepsilon}(u_1(x) - u_2(y) + \varepsilon \rho(x, y)) \xi(x, y) (\nu - \mu)(x) \, dx \, dy \\
+ \int \int_{\mathbb{R}^N \times \mathbb{R}^N} H_{\varepsilon}(u_1(x) - u_2(y) + \varepsilon \rho(x, y)) \xi(x, y) (\nu - \mu)(y) \, dx \, dy;
\]

\[
I_2(\varepsilon) := \int \int_{\mathbb{R}^N \times \mathbb{R}^N} \frac{\Phi_1}{|\Phi_1|}(x) \nabla |\Phi_1|_x (H_{\varepsilon}(u_1(x) - u_2(y) + \varepsilon \rho(x, y)) \xi(x, y)) \, d|\Phi_1|(x) \, dy;
\]

and

\[
I_3(\varepsilon) := -\int \int_{\mathbb{R}^N \times \mathbb{R}^N} \frac{\Phi_2}{|\Phi_2|}(y) \nabla |\Phi_2|_y (H_{\varepsilon}(u_1(x) - u_2(y) + \varepsilon \rho(x, y)) \xi(x, y)) \, d|\Phi_2|(y) \, dx.
\]

Recall that

\[
\int \nabla g(x) \, dx = 0 \text{ for any } g \in \text{Lip}(\mathbb{R}^N) \cap C_c(\mathbb{R}^N).
\] (4.18)

For short, in the following computation, we denote by
\[
H_{\varepsilon} := H_{\varepsilon}(u_1(x) - u_2(y) + \varepsilon \rho(x, y)) \text{ and } H'_{\varepsilon} := H'_{\varepsilon}(u_1(x) - u_2(y) + \varepsilon \rho(x, y)).
\]

Using the chain rule in Lemma 7.5, we have
Using the Lebesgue Dominated Convergence Theorem gives (4.20). Next, by (4.19) and (4.20),

\[ I_2(\varepsilon) = \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} \frac{\Phi_1}{|\Phi_1|}(x) \left( \nabla_{x}\xi H_\varepsilon + \nabla_{|\Phi_1|}u_1 H'_\varepsilon \xi + \varepsilon \nabla_{x}\rho H'_\varepsilon \xi \right) d|\Phi_1|(x)dy \]

\[ = \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} \frac{\Phi_1}{|\Phi_1|}(x) \left( (\nabla_{x}\xi + \nabla_{y}\xi)H_\varepsilon + (\nabla_{|\Phi_1|}u_1 - \nabla u_2(y))H'_\varepsilon \xi + \varepsilon (\nabla_{x}\rho + \nabla_{y}\rho)H'_\varepsilon \xi \right) d|\Phi_1|(x)dy \]

\[ \geq \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} \frac{\Phi_1}{|\Phi_1|}(x) \left( \nabla_{x}\xi + \nabla_{y}\xi \right) H_\varepsilon d|\Phi_1|(x)dy + \varepsilon \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} \frac{\Phi_1}{|\Phi_1|}(x)(\nabla_{x}\rho + \nabla_{y}\rho)H'_\varepsilon \xi d|\Phi_1|(x)dy, \tag{4.19} \]

where, in the second equality, we used (4.18) and the fact that \( \xi \in C_\infty_c(\mathbb{R}^N \times \mathbb{R}^N) \) as follows:

\[ \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} \frac{\Phi_1}{|\Phi_1|}(x) \left( \nabla_{y}\xi H_\varepsilon - \nabla u_2(y)H'_\varepsilon \xi + \varepsilon \nabla_{y}\rho H'_\varepsilon \xi \right) d|\Phi_1|(x)dy \]

\[ = \int_{\mathbb{R}^N} \frac{\Phi_1}{|\Phi_1|}(x) \int_{\mathbb{R}^N} \nabla_{y}(H_\varepsilon(u_1(x) - u_2(y) + \varepsilon\rho(x,y))\xi(x,y))dyd|\Phi_1|(x) = 0. \]

On the other hand,

\[ \varepsilon \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} \frac{\Phi_1}{|\Phi_1|}(x)(\nabla_{x}\rho + \nabla_{y}\rho)H'_\varepsilon(u_1(x) - u_2(y) + \varepsilon\rho(x,y))\xi d|\Phi_1|(x)dy \]

\[ = \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} \frac{\Phi_1}{|\Phi_1|}(x)(\nabla_{x}\rho + \nabla_{y}\rho)\chi_{[-\varepsilon\rho \leq u_1(x) - u_2(y) \leq (1-\varepsilon)\rho]}\xi d|\Phi_1|(x)dy \to 0. \tag{4.20} \]

Indeed, since \( \Phi_1 \) gives no mass on the set \([u_1 = u_2(y)]\), for each \( y \) (using again Lemma 7.5 (ii), the non-degeneracy of \( F \) and the definition of solution for \((P_\lambda)\)),

\[ F_\varepsilon(y) := \int_{\mathbb{R}^N} \frac{\Phi_1}{|\Phi_1|}(x)(\nabla_{x}\rho + \nabla_{y}\rho)\chi_{[-\varepsilon\rho \leq u_1(x) - u_2(y) \leq (1-\varepsilon)\rho]}\xi d|\Phi_1|(x) \]

\[ \to \int_{\mathbb{R}^N} \frac{\Phi_1}{|\Phi_1|}(x)(\nabla_{x}\rho + \nabla_{y}\rho)\chi_{[u_1(x) = u_2(y)]}\xi d|\Phi_1|(x) = 0; \]

and moreover,

\[ |F_\varepsilon(y)| \leq \int_{\mathbb{R}^N} |(\nabla_{x}\rho + \nabla_{y}\rho)|\xi d|\Phi_1|(x) \in L^1(\mathbb{R}^N). \]

Using the Lebesgue Dominated Convergence Theorem gives (4.20). Next, by (4.19) and (4.20),

\[ \lim inf_{\varepsilon} \frac{I_2}{\varepsilon} \geq - \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} |(\nabla_{x}\xi + \nabla_{y}\xi)| d|\Phi_1|(x)dy. \tag{4.21} \]
In the same way, we have
\[
\lim \inf \varepsilon \geq -\int_{\mathbb{R}^N} \int_{\mathbb{R}^N} |(\nabla x \xi + \nabla y \xi)| d\Phi_2(y) dx.
\] (4.22)

Concerning \( I_1(\varepsilon) \), we have the convergence in pointwise \((x,y)\),
\[
H_\varepsilon(u_1(x) - u_2(y) + \varepsilon \rho(x,y)) \to \text{Sign}_0^+(u_1(x) - u_2(y)) + \rho(x,y)\chi_{u_1(x)=u_2(y)},
\]
where
\[
\text{Sign}_0^+(r) = \begin{cases} 
1 & \text{if } r > 0 \\
0 & \text{if } r \leq 0.
\end{cases}
\]
Since \( \nu - \mu \in L^1 \), then
\[
I_1(\varepsilon) \to \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} (\theta_1(x) - \theta_2(y)) \left( \text{Sign}_0^+(u_1(x) - u_2(y)) + \rho(x,y)\chi_{u_1(x)=u_2(y)} \right) \xi dx dy \\
- \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} ((\nu - \mu)(x) - (\nu - \mu)(y)) \left( \text{Sign}_0^+(u_1(x) - u_2(y)) + \rho(x,y)\chi_{u_1(x)=u_2(y)} \right) \xi dx dy \\
\geq \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} (\theta_1(x) - \theta_2(y)) \left( \text{Sign}_0^+(u_1(x) - u_2(y)) + \rho(x,y)\chi_{u_1(x)=u_2(y)} \right) \xi dx dy \\
- \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} |(\nu - \mu)(x) - (\nu - \mu)(y)| \xi(x,y) dx dy,
\]
where we used the assumption \( 0 \leq \rho(x,y) \leq 1 \) and therefore
\[
\text{Sign}_0^+(u_1(x) - u_2(y)) + \rho(x,y)\chi_{u_1(x)=u_2(y)} \leq 1.
\]
Now, by density, we can choose \( \rho(x,y) := \text{Sign}_0^+(\theta_1(x) - \theta_2(y)) \), so that
\[
\lim \inf \varepsilon \geq \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} (\theta_1(x) - \theta_2(y))^+ \xi - \int_{\mathbb{R}^N} \int_{\mathbb{R}^N} |(\nu - \mu)(x) - (\nu - \mu)(y)| \xi(x,y) dx dy.
\]
Combining this with (4.17), (4.21) and (4.22), we obtain Lemma 4.3.

5. OMK equation vs optimal active submeasures

5.1. Partial minimum flow problem. Recall that in the connection between balanced MK problem and the Monge–Kantorovich equation the so called minimum flow problem is a key ingredient. For the PMK problem, the definition of minimum flow problem, that we call here the partial minimum flow problem, as well as its connection with the PMK problem are given in the following proposition.
Proposition 5.18 (Partial minimum flow problem). Let $\mu, \nu \in \mathcal{M}_b^+(\mathbb{R}^N)$ be compactly supported. For any $m \in [0, m_{\text{max}}]$, we have
\[
\min \{ \mathcal{K}(\sigma) : \sigma \in \pi_m(\mu, \nu) \} = \max \left\{ \mathcal{D}(\lambda, u) : (\lambda, u) \in \mathbb{R}^+ \times L^\lambda_{d_\rho} \right\}
\]
\[
= \min \left\{ \int_{\mathbb{R}^N} F \left( x, \frac{\Phi}{|\Phi|} (x) \right) \, d|\Phi|(x) : (\Phi, \theta^0, \theta^1) \in \Psi_m(\mu, \nu) \right\},
\]
where
\[
\Psi_m(\mu, \nu) := \left\{ (\Phi, \theta^0, \theta^1) \in \mathcal{M}_b(\mathbb{R}^N; \mathbb{R}^N) \times \mathcal{M}_b^+(\mathbb{R}^N) \times \mathcal{M}_b^+(\mathbb{R}^N) : \theta^0(\mathbb{R}^N) = \mu(\mathbb{R}^N) - m, \theta^1(\mathbb{R}^N) = \nu(\mathbb{R}^N) - m \right\}.
\]

The last minimization problem in (5.1) is called the partial minimum flow (PMF). We have an immediate consequence.

Corollary 5.19. If $(\Phi, \theta^0, \theta^1) \in \Psi_m(\mu, \nu)$ is an optimal solution to the PMF problem and $\theta^0 \leq \mu, \theta^1 \leq \nu$ then $\rho_0 := \mu - \theta^0$ and $\rho_1 := \nu - \theta^1$ are optimal active submeasures of the PMK problem. Conversely, if $\rho_0$ and $\rho_1$ are optimal active submeasures to the PMK problem then there is a vector measure $\Phi$ such that $(\Phi, \theta^0, \theta^1) := (\Phi, \mu - \rho_0, \nu - \rho_1)$ is a solution to the PMF problem.

Note that we do not have any constraints of type $\theta^0 \leq \mu$ or $\theta^1 \leq \nu$ in the definition of the PMF problem. However, following Theorem 5.20 and Proposition 4.16, these constraints are automatically satisfied for any optimal solutions $(\Phi, \theta^0, \theta^1)$ whenever $m \in \{(\mu \land \nu)(\mathbb{R}^N), m_{\text{max}}\}$. The case $m < (\mu \land \nu)(\mathbb{R}^N)$ is not interesting for the optimal partial transport problem because of the obviousness of solutions.

Proof of Proposition 5.18. The first equality has been shown in Theorem 2.4. Let us prove the second equality. First, for any $(\lambda, u) \in \mathbb{R}^+ \times L^\lambda_{d_\rho}$ and a triplet $(\Phi, \theta^0, \theta^1) \in \Psi_m(\mu, \nu)$, using Lemma 4.2, we have
\[
\int_{\mathbb{R}^N} ud(\nu - \mu) + \lambda(m - \nu(\mathbb{R}^N)) = \int_{\mathbb{R}^N} ud(\nu - \mu) - \lambda \int_{\mathbb{R}^N} d\theta^1
\]
\[
\leq \int_{\mathbb{R}^N} ud(\nu - \mu) + \int_{\mathbb{R}^N} ud\theta^0 - \int_{\mathbb{R}^N} ud\theta^1
\]
\[
= \int_{\mathbb{R}^N} \nabla |\Phi| u(x) \frac{\Phi}{|\Phi|} (x) d|\Phi| \leq \int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|} (x)) d|\Phi|.
\]
This shows that
\[
\max \left\{ \mathcal{D}(\lambda, u) : (\lambda, u) \in \mathbb{R}^+ \times L^\lambda_{d_\rho} \right\} \leq \inf \left\{ \int_{\mathbb{R}^N} F \left( x, \frac{\Phi}{|\Phi|} (x) \right) \, d|\Phi|(x) : (\Phi, \theta^0, \theta^1) \in \Psi_m(\mu, \nu) \right\}.
\]
Now, let \((\rho_0, \rho_1)\) be a couple of optimal active submeasures for the PMK problem w.r.t. \(\mathbf{m}\). Thanks to Corollary 4.17, there exists \(\Phi \in \mathcal{M}_b(\mathbb{R}^N; \mathbb{R}^N)\) such that \(-\nabla \cdot \Phi = \rho_1 - \rho_0\) and
\[
\int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|}(x)) d|\Phi| = \sup \left\{ \int_{\mathbb{R}^N} u \rho_1 - \rho_0 : u \in \text{Lip}_{d_F}, u \geq 0 \right\}
\]
\[
= \min \{ \mathcal{K}(\sigma) : \sigma \in \pi_{\mathbf{m}}(\rho_0, \rho_1) \}.
\]
Let us set
\[
\theta^0 := \mu - \rho_0 \quad \text{and} \quad \theta^1 := \nu - \rho_1.
\]
Then \((\Phi, \theta^0, \theta^1) \in \Psi_{\mathbf{m}}(\mu, \nu)\) and
\[
\int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|}(x)) d|\Phi| = \min \{ \mathcal{K}(\sigma) : \sigma \in \pi_{\mathbf{m}}(\rho_0, \rho_1) \} = \max \left\{ \mathcal{D}(\lambda, u) : (\lambda, u) \in \mathbb{R}^+ \times L^\lambda_{d_F} \right\}.
\]

### 5.2. Link between the OMK equation and the PMK problem

The connection between the OMK equation and the PMK problem appears when we deal with the extremal condition between the PMF problem and DPMK problem. Roughly speaking, the optimality condition in the duality of the DPMK and PMK problems corresponds to \((P_\lambda)\) for some \(\lambda\).

**Theorem 5.20.** Let \(\mu, \nu \in \mathcal{M}_b^+(\mathbb{R}^N)\) be compactly supported.

(i) Given \(\mathbf{m} \in [0, \mathbf{m}_{\text{max}}]\) and a solution \((\Phi, \theta^0, \theta^1)\) to the PMF problem and \((\lambda, u)\) is a solution to the DPMK problem. Setting \(\theta := \theta^1 - \theta^0\), the triplet \((\theta, \Phi, u)\) is a solution to the OMK equation \((P_\lambda)\). Moreover, \(\theta^+ = \theta^1\) and \(\theta^- = \theta^0\) if \(\mathbf{m} \geq (\mu \land \nu)(\mathbb{R}^N)\).

(ii) Given \(\lambda \geq 0\) and \((\theta, \Phi, u)\) a solution to the OMK equation \((P_\lambda)\). Then \((\lambda, u)\) is a solution to the DPMK problem corresponding to \(\mathbf{m} = (\mu - \theta^-)(\mathbb{R}^N)\) and \((\Phi, \theta^0, \theta^1) := (\Phi, \theta^-, \theta^+)\) is a solution to the associated PMF problem.

**Proof.** (i) From the optimality of \((\Phi, \theta^0, \theta^1)\) and of \((\lambda, u)\), using Proposition 5.18, we have
\[
\int_{\mathbb{R}^N} u(\nu - \mu) + \lambda(\mathbf{m} - \nu(\mathbb{R}^N)) = \int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|}(x)) d|\Phi|,
\]
or
\[
\int_{\mathbb{R}^N} u(\nu - \mu) = \int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|}(x)) d|\Phi| + \lambda \int_{\mathbb{R}^N} d\theta^1.
\]

Thanks to Proposition 4.13, we have that \(u\) and \((\Phi, \theta^0, \theta^1)\) are solutions for the duality (4.1). Using Proposition 4.15, we have that \((\theta, \Phi, u)\) is a solution to the OMK equation \((P_\lambda)\). Now, let us show that \(\theta^+ = \theta^1\) and \(\theta^- = \theta^0\) for the case \(\mathbf{m} \geq (\mu \land \nu)(\mathbb{R}^N)\). We divide into two cases: If \(\mathbf{m} = (\mu \land \nu)(\mathbb{R}^N)\), then the total cost of the associated optimal partial transport problem is zero. This implies that \(\Phi \equiv 0\) and \(\theta := \theta^1 - \theta^0 = \nu - \mu = \nu - \mu \land \nu - (\mu - \mu \land \nu)\). By the Jordan decomposition, we have
\[
\theta^+ = \nu - \mu \land \nu \leq \theta^1 \quad \text{and} \quad \theta^- = \mu - \mu \land \nu \leq \theta^0.
\]
Using the constraints on the total mass of \(\theta^0\) and of \(\theta^1\), we obtain
\[
\theta^+ = \nu - \mu \land \nu = \theta^1 \quad \text{and} \quad \theta^- = \mu - \mu \land \nu = \theta^0.
\]
If \( m > \mu \land \nu \langle R^N \rangle \) then \( \lambda > 0 \) and the conclusion follows from Proposition 4.15. (ii) The proof is similar as the one of Proposition 4.15 (ii) with the use of the duality (5.1). □

We are now ready to give the proof of the connection between optimal active submeasures and solutions \( \theta \) of the OMK equation.

**Proof of Theorem 2.8.** First, let \( \theta_\lambda \) be a solution of the OMK equation \( (P_\lambda) \). Thanks to Proposition 4.16, \( 0 \leq \mu - \theta_\lambda^- \leq \mu \) and \( 0 \leq \nu - \theta_\lambda^+ \leq \nu \). Then, using Theorem 5.20 (ii) and Corollary 5.19, we deduce that \( \rho_0 := \mu - \theta_\lambda^- \) and \( \rho_1 := \nu - \theta_\lambda^+ \) are optimal active submeasures. Conversely, let \( m \in [\mu \land \nu \langle R^N \rangle, m_{\text{max}}] \) and \( (\rho_0, \rho_1) \) be a couple of optimal active submeasures. Let \( (\lambda_m, u_m) \) be a solution of the DPMK problem. Thanks to Corollary 5.19, there exists a flow \( \Phi \) such that \( (\Phi, \mu - \rho_0, \nu - \rho_1) \) is a solution of the corresponding PMF problem. And, thanks to Theorem 5.20 (i), \( \theta_{\lambda_m} := \nu - \rho_1 - \mu + \rho_0 \) is a solution of the OMK equation \( (P_{\lambda_m}) \) and

\[
\theta_{\lambda_m}^+ = \nu - \rho_1, \quad \theta_{\lambda_m}^- = \mu - \rho_0.
\]

Thanks to the above connection, let us give the proof of the uniqueness of optimal active submeasures by using the result of the OMK equation.

**Proof of Corollary 2.9.** Assume that \( (\rho_0, \rho_1) \) and \( (\eta_0, \eta_1) \in \text{Sub}_m(\mu, \nu) \) are two pairs of optimal active submeasures. We will show that \( \rho_0 = \eta_0 \) and \( \rho_1 = \eta_1 \). Let \( \lambda_m \geq 0 \) be fixed such that

\[
\lambda_m \in \arg\max_{\lambda \geq 0} \left\{ \max_{\mu, \nu} \left\{ D(\lambda, u) : u \in L_{DF}^\lambda \right\} \right\}.
\]

Let \( \theta_1, \theta_2 \) be Lebesgue functions with negative and positive parts defined by

\[
\theta_1^+ = \nu - \rho_1, \quad \theta_1^- = \mu - \rho_0,
\]

and \( \theta_2^+ = \nu - \eta_1, \quad \theta_2^- = \mu - \eta_0. \)

Thanks to Theorem 2.8, \( \theta_1 \) and \( \theta_2 \) are solutions to the same OMK equation \( (P_{\lambda_m}) \). So, using the uniqueness in Theorem 2.7, we deduce that \( \theta_1 = \theta_2 \) and that \( \theta_1^- = \theta_2^-, \theta_1^+ = \theta_2^+ \). This implies that \( \rho_0 = \eta_0 \) and \( \rho_1 = \eta_1 \). □

6. Monotonicity

In order to study the maps \( m \) and \( R \) defined in Section 2, we study the monotone and continuous dependence of the solution \( \theta_\lambda \) of the OMK equation \( (P_\lambda) \) on the parameter \( \lambda \).

**Proposition 6.21** (Monotonicity and continuity of \( \theta_\lambda \)). Let \( \mu, \nu \in \mathcal{M}_b^+ (\langle R^N \rangle) \) be compactly supported and absolutely continuous. Let \( (\theta_\lambda, \Phi_\lambda, u_\lambda) \) be a solution to the OMK equation \( (P_\lambda) \). (i) Let \( 0 \leq \lambda_1 \leq \lambda_2 \) and \( \theta_{\lambda_1}, \theta_{\lambda_2} \) be solutions to the OMK equations \( (P_{\lambda_1}) \) and \( (P_{\lambda_2}) \), respectively. Then

\[
\theta_{\lambda_1}^+ \geq \theta_{\lambda_2}^+ \quad \text{and} \quad \theta_{\lambda_1}^- \geq \theta_{\lambda_2}^-.
\]

(ii) If a nonnegative sequence \( \lambda_n \to \lambda \) then \( \theta_{\lambda_n} \to \theta_\lambda \) strongly in \( L^1 (\langle R^N \rangle) \).
Lemma 6.4 (Monotonicity of total mass). For any $\lambda \geq 0$, let $\theta_\lambda$ be the solution of the OMK equation $(P_\lambda)$ and $m_\lambda := (\mu - \theta_\lambda)(\mathbb{R}^N) = (\nu - \theta_\lambda^*)(\mathbb{R}^N)$. If $0 \leq \lambda_1 \leq \lambda_2$ then
\[
(\mu \wedge \nu)(\mathbb{R}^N) \leq m_{\lambda_1} \leq m_{\lambda_2} \leq m_{\text{max}}.
\]

Proof. Thanks to Proposition 4.16, we see that $\mu \wedge \nu \leq \mu - \theta_\lambda^*$ and therefore $(\mu \wedge \nu)(\mathbb{R}^N) \leq m_{\lambda}$. Since $\mu - \theta_\lambda^* \leq \mu$ and $\nu - \theta_\lambda^* \leq \nu$, we have $m_{\lambda} \leq m_{\text{max}}$. For the monotonicity, due to Theorem 5.20, $(\lambda_1, u_{\lambda_1})$ and $(\lambda_2, u_{\lambda_2})$ are solutions to the DPMK problem w.r.t. $m_{\lambda_1}$ and $m_{\lambda_2}$. By optimality, we have
\[
\int u_{\lambda_1} d(\nu - \mu) + \lambda_1 (m_{\lambda_1} - \nu(\mathbb{R}^N)) \geq \int u_{\lambda_2} d(\nu - \mu) + \lambda_2 (m_{\lambda_2} - \nu(\mathbb{R}^N)),
\]
and
\[
\int u_{\lambda_2} d(\nu - \mu) + \lambda_2 (m_{\lambda_2} - \nu(\mathbb{R}^N)) \geq \int u_{\lambda_1} d(\nu - \mu) + \lambda_1 (m_{\lambda_1} - \nu(\mathbb{R}^N)).
\]
Adding both sides, we obtain
\[
\lambda_1 m_{\lambda_1} + \lambda_2 m_{\lambda_2} \geq \lambda_2 m_{\lambda_1} + \lambda_1 m_{\lambda_2},
\]
or
\[
(\lambda_2 - \lambda_1)(m_{\lambda_2} - m_{\lambda_1}) \geq 0.
\]

To prove Proposition 6.21, we use the following result whose proof is given in [12].

Theorem 6.22. ([12, Theorem 3.4]) Let $\Gamma_{\text{opt}}^m$ be the set of optimal transport plans of the mass $m \geq 0$. There is a curve $m \in [0, \min\{\|\mu\|_{L^1}, \|\nu\|_{L^1}\}] \rightarrow \gamma^m \in \Gamma_{\text{opt}}^m$ along which the left and right marginals $\gamma^{m+\varepsilon}$ dominate those of $\gamma^m$ whenever $\varepsilon > 0$.

Proof of Proposition 6.21. (i) Set $m_i := m_{\lambda_i} \geq (\mu \wedge \nu)(\mathbb{R}^N), i = 1, 2$. Since $\lambda_1 \leq \lambda_2$ and Lemma 6.4, we have $m_1 \leq m_2$. Thanks to Theorem 6.22, there exist pairs of optimal active submeasures $(\rho_0^{\lambda_i}, \rho_1^{\lambda_i})$ corresponding to the mass $m_i, i = 1, 2$, such that
\[
\rho_0^{\lambda_1} \leq \rho_0^{\lambda_2} \quad \text{and} \quad \rho_1^{\lambda_1} \leq \rho_1^{\lambda_2}. \tag{6.1}
\]
By Theorem 5.20 (ii), $(\lambda_1, u_{\lambda_1})$ is a solution to the DPMK with mass $m_1$. Setting $\theta := \nu - \rho_1^{\lambda_1} - \mu + \rho_0^{\lambda_1}$. By Theorem 5.20 (i), there is $\Phi$ such that $(\theta, \Phi, u_{\lambda_1})$ is a solution to the OMK equation $(P_{\lambda_1})$. Due to the uniqueness in Theorem 2.7, we get
\[
\theta_{\lambda_1} = \theta = \nu - \rho_1^{\lambda_1} - \mu + \rho_0^{\lambda_1}.
\]
Following the proof of Theorem 2.8, we obtain
\[
\theta^-_{\lambda_1} = \mu - \rho_0^{\lambda_1} \quad \text{and} \quad \theta^+_{\lambda_1} = \nu - \rho_1^{\lambda_1}.
\]
In the same way, we have
\[
\theta_{\lambda_2} = \mu - \rho_0^{\lambda_2} \quad \text{and} \quad \theta^+_{\lambda_2} = \nu - \rho_1^{\lambda_2}.
\]
Combining these with (6.1), we get $\theta^-_{\lambda_1} \geq \theta^-_{\lambda_2}$ and $\theta^+_{\lambda_1} \geq \theta^+_{\lambda_2}$.

(ii) Since $\theta_{\lambda_n} \leq \mu, \theta_{\lambda_n}^+ \leq \nu$ as in Proposition 4.16, we have that $|\theta_{\lambda_n}| \leq \mu + \nu \in L^1$ and therefore $\{\theta_{\lambda_n}\}$ is equi-integrable. By Dunford–Pettis theorem, up to a subsequence, $\theta_{\lambda_n}$ converges weakly to some $\theta \in L^1(\mathbb{R}^N)$. Now, let us show that $\theta$ is a solution of the OMK equation $(P_\lambda)$. Once this
is done, by the uniqueness in Theorem 2.7, we deduce that \( \theta \equiv \theta_\lambda \) and thus the whole sequence \( \theta_{\lambda_n} \rightarrow \theta_\lambda \) weakly in \( L^1(\mathbb{R}^N) \). By the non-degeneracy of \( F \) and the definition of solution for the OMK equation \( (P_{\lambda_n}) \), it is clear that \( \{u_{\lambda_n}\} \) is bounded and equi-Lipschitz; and that \( \{\Phi_{\lambda_n}\} \) is bounded in \( \mathcal{M}_b(\mathbb{R}^N; \mathbb{R}^N) \). So, up to subsequence,

\[
u_{\lambda_n} \rightarrow u \quad \text{uniformly on each compact subset of } \mathbb{R}^N,\]

and

\[
\Phi_{\lambda_n} \rightarrow \Phi \quad \text{weakly}^* \in \mathcal{M}_b(\mathbb{R}^N; \mathbb{R}^N).
\]

Let us show that \( (\theta, \Phi, u) \) is a solution to the OMK equation \( (P_\lambda) \). First, it is clear that \( u \in L^2_{d\xi} \),

\[
\int u \, d\theta^- = \lim_{\lambda_n \rightarrow \lambda} \int u_{\lambda_n} \, d\theta_{\lambda_n}^- = 0,
\]

and

\[
\int (u - \lambda) \, d\theta^+ = \lim_{\lambda_n \rightarrow \lambda} \int (u_{\lambda_n} - \lambda_n) \, d\theta_{\lambda_n}^+ = 0.
\]

Moreover,

\[
\int \xi \, d\theta + \int \frac{\Phi}{|\Phi|} \nabla \xi \, d|\Phi| = \lim_{\lambda_n \rightarrow \lambda} \int \xi \, d\theta_{\lambda_n} + \int \frac{\Phi_{\lambda_n}}{|\Phi_{\lambda_n}|} \nabla \xi \, d|\Phi_{\lambda_n}| = \int \xi \, d(\nu - \mu) \quad \forall \xi \in C_c^\infty(\mathbb{R}^N),
\]

which implies that

\[
\theta - \nabla \cdot \Phi = \nu - \mu \quad \text{in } \mathcal{D}'(\mathbb{R}^N).
\]

It remains to check that \( \frac{\Phi}{|\Phi|}(x) \nabla |\Phi| u(x) = F(x, \frac{\Phi}{|\Phi|}(x)), |\Phi|-\text{a.e. } x \in \mathbb{R}^N \). Thanks to Lemma 4.2, this is equivalent to

\[
\int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|}(x)) \, d|\Phi| \leq \int_{\mathbb{R}^N} \frac{\Phi}{|\Phi|}(x) \nabla |\Phi| u(x) \, d|\Phi|. \quad (6.2)
\]

Since \( \Phi_{\lambda_n} \rightarrow \Phi \) weakly* in \( \mathcal{M}_b(\mathbb{R}^N; \mathbb{R}^N) \), we have (see e.g. [2, Theorem 2.38])

\[
\int_{\mathbb{R}^N} F(x, \frac{\Phi}{|\Phi|}(x)) \, d|\Phi| \leq \liminf_{\lambda_n \rightarrow \lambda} \int_{\mathbb{R}^N} F(x, \frac{\Phi_{\lambda_n}}{|\Phi_{\lambda_n}|}(x)) \, d|\Phi_{\lambda_n}|. \quad (6.3)
\]

On the other hand,

\[
\lim_{\lambda_n \rightarrow \lambda} \int_{\mathbb{R}^N} F(x, \frac{\Phi_{\lambda_n}}{|\Phi_{\lambda_n}|}(x)) \, d|\Phi_{\lambda_n}| = \lim_{\lambda_n \rightarrow \lambda} \frac{\Phi_{\lambda_n}}{|\Phi_{\lambda_n}|} \nabla |\Phi_{\lambda_n}| u_{\lambda_n} \, d|\Phi_{\lambda_n}| = \lim_{\lambda_n \rightarrow \lambda} \int u_{\lambda_n} \, d(\nu - \mu) + \int u_{\lambda_n} \, d\theta_{\lambda_n} \quad (6.4)
\]

\[
= \int u \, d(\nu - \mu) + \int u \, d\theta = \int \frac{\Phi}{|\Phi|}(x) \nabla |\Phi| u(x) \, d|\Phi|.
\]

From (6.3) and (6.4), we deduce (6.2). We have just proved that \( \theta_{\lambda_n} \rightarrow \theta_\lambda \) weakly in \( L^1(\mathbb{R}^N) \). At last, by the monotonicity of the first part, we deduce the strong convergence in \( L^1(\mathbb{R}^N) \). \( \square \)
Proof of Theorem 2.10. The fact that \( m_\lambda \in ((\mu \land \nu)(\mathbb{R}^N), m_{\text{max}}) \) and the monotonicity of \( m_\lambda \) are given in Lemma 6.4 while the continuity of \( m_\lambda \) follows from the continuity of \( \theta_\lambda \). Let us show the surjectivity of \( m_\lambda \). Fix any \( m \in ((\mu \land \nu)(\mathbb{R}^N), m_{\text{max}}) \). Let \((\rho_0, \rho_1)\) be a couple of optimal active submeasures w.r.t. \( m \). Taking \( \lambda := \lambda_m \) as in Theorem 2.8 (ii), then \( m_\lambda = m \).

Now, for the properties of \( \mathcal{R} \), the proof follows again from Theorem 2.8 and Proposition 6.21. □

7. Appendix

In this section, we prove a chain rule for the tangential gradient which was used in the paper.

Lemma 7.5 (Chain rule for the tangential gradient). Let \( \eta \in \mathcal{M}_b^+(\mathbb{R}^N) \) and \( u \) be a Lipschitz continuous function defined on \( \mathbb{R}^N \). Let \( G \) be a Lipschitz continuous function on \( \mathbb{R} \) such that the set of non-differentiable points of \( G \) is finite. Then

\[
\nabla_\eta G'(u)(x) = G'(u(x))\nabla_\eta u(x), \quad \text{for } \eta\text{-a.e. } x,
\]

where \( G'(u(x)) \) is the usual derivative with convention \( G'(u(x))\nabla_\eta u(x) = 0 \) if \( \nabla_\eta u(x) = 0 \) even \( G \) is not differentiable at \( u(x) \). In particular, we have

(i) \( \nabla_\eta u^+ = \chi_{[u>0]}\nabla_\eta u \) and \( \nabla_\eta u^- = -\chi_{[u<0]}\nabla_\eta u \), \( \eta \)-a.e. in \( \mathbb{R}^N \);

(ii) \( \nabla_\eta u = 0 \), \( \eta \)-a.e. on the set \( [u = c] := \{x \in \mathbb{R}^N : u(x) = c\} \) for any constant \( c \in \mathbb{R} \).

Proof. 1. Let us first assume that \( G \) is continuously differentiable. To prove (7.1), it is enough to show that

\[
\int_{\mathbb{R}^N} \nabla_\eta G(u) \cdot \Phi \, d\eta = \int_{\mathbb{R}^N} G'(u)\nabla_\eta u \cdot \Phi \, d\eta,
\]

for every \( \Phi \in L^1(\mathbb{R}^N; \mathbb{R}^N) \) such that \( \Phi(x) \in T_\eta(x) \), \( \eta \)-a.e. \( x \in \mathbb{R}^N \), where \( T_\eta(x) \) is the tangential space w.r.t. \( \eta \) (see \[10, 11, 25\]). Let \( u_\varepsilon \in C^\infty(\mathbb{R}^N) \) be the regularization of \( u \) by convolution. Since \( u \) and \( G \) are Lipschitz, we have that \( u_\varepsilon \) and \( G \circ u_\varepsilon \) converge uniformly to \( u \) and \( G \circ u \) on \( \mathbb{R} \), respectively. Thus (see e.g. \[25\), Proposition 4.5]) \( \nabla_\eta G(u_\varepsilon) \) and \( \nabla_\eta G(u_\varepsilon) \) converge to \( \nabla_\eta u \) and \( \nabla_\eta G(u) \) in \( L^\infty(\mathbb{R}^N; \mathbb{R}^N) \)-w* respectively. Since \( \Phi(x) \in T_\eta(x) \), \( \eta \)-a.e. \( x \in \mathbb{R}^N \), we have

\[
\int_{\mathbb{R}^N} \nabla_\eta G(u) \cdot \Phi \, d\eta = \lim_{\varepsilon \to 0} \int_{\mathbb{R}^N} \nabla_\eta G(u_\varepsilon) \cdot \Phi \, d\eta
\]

\[
= \lim_{\varepsilon \to 0} \int_{\mathbb{R}^N} \nabla G(u_\varepsilon) \cdot \Phi \, d\eta
\]

\[
= \lim_{\varepsilon \to 0} \int_{\mathbb{R}^N} G'(u_\varepsilon)\nabla u_\varepsilon \cdot \Phi \, d\eta
\]

\[
= \lim_{\varepsilon \to 0} \int_{\mathbb{R}^N} G'(u_\varepsilon)\nabla_\eta u_\varepsilon \cdot \Phi \, d\eta = \int_{\mathbb{R}^N} G'(u)\nabla_\eta u \cdot \Phi \, d\eta.
\]

This gives the result (7.1) whenever \( G \) is continuously differentiable by taking

\[
\Phi = \nabla_\eta G(u) - G'(u)\nabla_\eta u.
\]
For (i), consider the function \( G_\varepsilon(r) := \begin{cases} \sqrt{r^2 + \varepsilon^2} - \varepsilon & \text{if } r > 0 \\ 0 & \text{if } r \leq 0 \end{cases} \). Then \( G_\varepsilon \) is continuously differentiable and Lipschitz on \( \mathbb{R} \). Thus we have

\[
\int_{\mathbb{R}^N} \nabla_\eta G_\varepsilon(u) \cdot \Phi \, d\eta = \int_{\mathbb{R}^N} G_\varepsilon'(u) \nabla_\eta u \cdot \Phi \, d\eta = \int_{\{[u > 0]\}} \frac{u}{\sqrt{u^2 + \varepsilon^2}} \nabla_\eta u \cdot \Phi \, d\eta
\]

for every \( \Phi \in L^1(\mathbb{R}^N; \mathbb{R}^N) \) such that \( \Phi(x) \in T_\eta(x) \) for \( \eta \)-a.e. \( x \). Letting \( \varepsilon \to 0 \), we obtain

\[
\int_{\mathbb{R}^N} \nabla_\eta u^+ \cdot \Phi \, d\eta = \int_{\{[u > 0]\}} \nabla_\eta u \cdot \Phi \, d\eta = \int_{\mathbb{R}^N} \chi_{[u > 0]} \nabla_\eta u \cdot \Phi \, d\eta.
\]

The proof of the positive part ends up by choosing \( \Phi := \nabla_\eta G(u) - G'(u) \nabla_\eta u \). A similar proof is done for the negative part. For (ii), we can assume that \( c = 0 \). The proof follows from \( \nabla_\eta u = \nabla_\eta u^+ - \nabla_\eta u^- \).

2. Now, let us deal with a general Lipschitz function \( G \) satisfying our assumptions. Let us call \( \{r_1, r_2, \ldots, r_n\} \) the set of non-differentiable points of \( G \) and set open subsets \( \Omega_i := u^{-1}(\mathbb{R} \setminus \{r_i\}) \) and \( \Omega := \bigcap_{i=1}^{n} \Omega_i \). In this case, since \( u \) is a constant on the set \( \mathbb{R}^N \setminus \Omega_i, i = 1, \ldots, n \), we have

\[
\nabla_\eta G(u)(x) = G'(u(x)) \nabla_\eta u(x) = 0 \quad \text{for } \eta \text{-a.e. } x \in \mathbb{R}^N \setminus \Omega_i, i = 1, \ldots, n.
\]

It remains to verify that

\[
\nabla_\eta G(u)(x) = G'(u(x)) \nabla_\eta u(x) \quad \text{for } \eta \text{-a.e. } x \in \Omega.
\]

Let us assume that \( \Omega \neq \emptyset \) (if not, there is nothing to prove). Let \( G_\varepsilon \) be a smooth approximation of \( G \) by convolution. Let \( \Phi \in L^1(\mathbb{R}^N; \mathbb{R}^N) \) be such that \( \Phi(x) = 0 \) for \( \eta \)-a.e. \( x \in \mathbb{R}^N \setminus \Omega \). Then

\[
\int_{\mathbb{R}^N} \nabla_\eta G(u) \Phi \, d\eta = \lim_{\varepsilon \to 0} \int_{\mathbb{R}^N} \nabla_\eta G_\varepsilon(u) \Phi \, d\eta
\]

\[
= \lim_{\varepsilon \to 0} \int_{\mathbb{R}^N} G_\varepsilon'(u) \nabla_\eta u \Phi \, d\eta
\]

\[
= \lim_{\varepsilon \to 0} \int_{\Omega} G_\varepsilon'(u) \nabla_\eta u \Phi \, d\eta \quad \text{(since } \Phi(x) = 0, \eta \text{-a.e. } x \text{ in } \mathbb{R}^N \setminus \Omega)\]

\[
= \int_{\Omega} G'(u) \nabla_\eta u \Phi \, d\eta,
\]

where we used the Lebesgue Dominated Convergence Theorem. Next, choosing

\[
\Phi = \nabla_\eta G(u) - G'(u) \nabla_\eta u
\]

as a test function, we obtain (7.2). \( \square \)
