Abstract

This article studies the local controllability to trajectories of a one dimensional model for turbulence. By linearization we are led to an equation with a non local term whose controllability properties are analyzed by using Fourier decomposition and biorthogonal techniques. Once the existence of controls is proved and the dependence of their norms with respect to the time is established for the linearized model, a fixed point method allows us to deduce the result for the nonlinear initial problem.

1 Introduction

In [7], the authors tackle the local null controllability of a Ladyzhenskaya-Smagorinsky model of turbulence. More precisely, they consider the following control problem

\[
\begin{aligned}
\partial_t w + (w \cdot \nabla) w - \nu(\|\nabla w\|_{L^2(\Omega)}^2)\Delta w + \nabla q &= u_\omega \quad \text{in} \ (0, T) \times \Omega, \\
\text{div} w &= 0 \quad \text{in} \ (0, T) \times \Omega, \\
w &= 0 \quad \text{on} \ (0, T) \times \partial \Omega, \\
w(0, \cdot) &= w_0 \quad \text{in} \ \Omega,
\end{aligned}
\]

where \(\nu : \mathbb{R}_+ \to [\nu_0, \infty)\) is a \(C^1\) function, with \(\nu_0 > 0\) and with bounded derivatives. Following the method used for the controllability of the Navier-Stokes system (see [6]), they show a Carleman estimate for the linearized system and, with a fixed point argument, they obtain the local controllability to the null state \((w(T, \cdot) = 0\). In Section 6 of [7], it is mentioned that at the contrary to the Navier-Stokes system, it is not clear how to obtain the local controllability to the trajectories. Indeed, in the linearized system, one has to deal with non-local terms.

In [8], a partial answer to the above question is given: the authors consider the linear heat and the linear wave system and show that one can recover the controllability properties of these systems if some non local terms are added. More precisely, their results are obtained for any dimension in space, but they need that the nonlocal integral terms are analytic in space.

Unhappily, in the above paper, the proof is given through a contradiction argument and in particular, it is not clear how to keep the cost of the linear heat equation in order to tackle nonlinear problems. Our aim is here to study the controllability of a Burgers system with variable viscosity. This can be seen as a simplified model for the turbulence model considered in [7]. More precisely, our system writes as

\[
\begin{aligned}
\partial_t w - \nu(\|\partial_x w\|_{L^2(0, \pi)}^2)\partial_{xx} w + w \partial_x w &= f^S + u_\omega \chi \quad \text{in} \ (0, T) \times (0, \pi), \\
w(0, \cdot) &= w_0 := y_0 + w^S \quad \text{in} \ (0, \pi),
\end{aligned}
\]

(1.1)

where \(\omega\) is a non empty open interval of \((0, \pi)\). In what follows, we assume that \(\nu : \mathbb{R}_+ \to [\nu_0, \infty)\) is a \(C^2\) function, with \(\nu_0 > 0\). In (1.1) the function \(f^S\) depends only on \(x\) and belongs to \(L^2(0, \pi)\).

Our aim in this paper is to obtain the local exact controllability to the stationary trajectories. More precisely, \(w^S\) and \(f^S\) in the above system are related through the stationary equations:

\[
\begin{aligned}
-\nu(\|\partial_x w^S\|_{L^2(0, \pi)}^2)\partial_{xx} w^S + w^S \partial_x w^S &= f^S \quad \text{in} \ (0, T) \times (0, \pi), \\
w^S(0) &= w^S(\pi) = 0.
\end{aligned}
\]

(1.2)

We can write the above problem as a null controllability problem by setting

\[y := w - w^S.\]

Then \(y\) satisfies the following nonlinear heat-type system:

\[
\begin{aligned}
\partial_t y - \nu^S \partial_{xx} y - \mu \left( \int_0^\pi (\partial_x w^S)(\partial_x y) \, dx \right) \partial_{xx} w^S + w^S \partial_x y + y \partial_x w^S &= F + u_\omega \chi, \\
y(t, 0) &= y(t, \pi) = 0, \\
y(0, \cdot) &= y_0,
\end{aligned}
\]
and

(1.3) \[ F = -y \partial_x y + \left[ \nu (\| \partial_y \|_{L^2(0, \pi)}^2) - \nu (\| \partial_y w^S \|_{L^2(0, \pi)}^2) \right] \partial_{xx} y \]

\[ + \left[ \nu (\| \partial_y \|_{L^2(0, \pi)}^2) - \nu (\| \partial_y w^S \|_{L^2(0, \pi)}^2) \right] \partial_{xx} w^S, \]

with

\[ \nu^S := \nu (\| \partial_y w^S \|_{L^2(0, \pi)}^2) > 0 \quad \text{and} \quad \mu = 2 \nu' (\| \partial_y w^S \|_{L^2(0, \pi)}^2). \]

By integrating by parts and linearization we are lead to study

(1.4) \[
\begin{cases}
\partial_t y - \partial_{xx} y + \mu \left( \int_0^\pi a y \, dx \right) a + w^S \partial_x y + y \partial_x w^S = u \chi, \\
y(t, 0) = y(t, \pi) = 0, \\
y(0, \cdot) = y_0,
\end{cases}
\]

where \(a\) is smooth function and \(\mu \in \mathbb{R}\). We have assumed \(\nu^S = 1\) to simplify.

Let us consider

(1.5) \[ z(t, x) := y(t, x) e^{-W(x)}. \]

Then standard calculation yields

\[ \partial_t y - \partial_{xx} y + \mu \left( \int_0^\pi a y \, dx \right) a + w^S \partial_x y + y \partial_x w^S \]

\[ = e^W \left( \partial_t z - \partial_{xx} z - 2W'(\partial_x z) - W'' z - (W')^2 z \right) \]

\[ + \mu \left( \int_0^\pi a e^W z \, dx \right) a e^{-W} + w^S (\partial_x z + W' z) + z \partial_x w^S. \]

The system (1.4) is transformed into

(1.6) \[
\begin{cases}
\partial_t z - \partial_{xx} z + \int_0^\pi K(\xi, \cdot) z(\xi) \, d\xi + pz = v \chi, \\
z(t, 0) = z(t, \pi) = 0, \\
z(0, \cdot) = z_0,
\end{cases}
\]

\[ p = \left( \frac{1}{2} \partial_x w^S + \frac{1}{4} (w^S)^2 \right), \]

\[ K(\xi, x) = a(\xi) e^{W(x)} a(x) e^{-W(x)}. \]

Let us define the unbounded operator \((D(A), A)\) in \(L^2(0, \pi)\) as follows

\[ D(A) = H^2(0, \pi) \cap H^1_0(0, \pi), \]

(1.7) \[ Az = -\partial_{xx} z + \int_0^\pi K(\xi, \cdot) z(\xi) \, d\xi + pz \quad (z \in D(A)), \]
where \( p \in L^\infty(0, \pi) \) and the kernel \( K \in L^2((0, \pi)^2) \).

With this notation, system (1.6) can be equivalently written as follows

\[
\begin{aligned}
\partial_t z(t) + A z(t) &= v t, \\
z(0) &= z_0.
\end{aligned}
\] (1.8)

The adjoint \((D(A^*), A^*)\) of the operator \((D(A), A)\) is given by

\[
D(A^*) = H^2(0, \pi) \cap H^1_0(0, \pi),
\] (1.9)

\[
A^* w = -\partial_{xx} w + \int_0^\pi K(\cdot, \xi) w(\xi) d\xi + q w \quad (w \in D(A^*)),
\]

where \( K \in L^2((0, \pi)^2) \) and \( q \in L^\infty(0, \pi) \) are given by

\[
K(x, \xi) = \overline{K(x, \xi)}, \quad q = \overline{p}.
\]

Also, we introduce the following “adjoint problem”:

\[
\begin{aligned}
\partial_t \phi(t) + A^* \phi(t) &= 0, \\
\phi(0) &= \phi_0.
\end{aligned}
\] (1.10)

The following result is classic in control theory (see [5] or Theorem 11.2.1 in [13]).

**Theorem 1.1.** Let \( T > 0 \) and let \( \omega \subset [0, \pi] \) be a non empty open set. For each \( z_0 \in L^2(0, \pi) \) there exists \( v \in L^2((0, T) \times \omega) \) such that the solution \( z \) of (1.8) vanishes at \( T \), if and only if there exists a constant \( C = C(T) \) such that the following inequality holds

\[
||\phi(T)||_{L^2(0, \pi)}^2 \leq C \int_0^T \int_\omega |\phi(t, x)|^2 dx dt,
\] (1.11)

for any \( \phi_0 \in L^2(0, \pi) \) and \( \phi \) solution of (1.10). Moreover, if (1.11) holds, then there exists a control \( v \in L^2(0, T) \) which verifies

\[
||v||_{L^2(0, T)}^2 \leq C ||z_0||_{L^2(0, \pi)}^2 \quad (z_0 \in L^2(0, \pi)).
\] (1.12)

A key result of this paper is the following theorem concerning the observability inequality (1.11) which also estimates the behavior of the constant \( C \) as \( T \) tends to zero.

**Theorem 1.2.** Let \( \omega \subset [0, \pi] \) be a non empty open set. Suppose that the kernel \( K \) is degenerate, i.e. there exist two functions \( \alpha, \beta \in L^2(0, \pi) \) such that \( K(x, \xi) = \alpha(x) \beta(\xi) \) for each \( (x, \xi) \in [0, \pi]^2 \) and suppose that \( \alpha \) is not identically zero in \( \omega \). Then, there exist three positive constants \( T_0, M_0 \) and \( \zeta \) such that, for any \( T \in (0, T_0) \) and \( \varphi_0 \in L^2(0, \pi) \), the corresponding solution \( \varphi \) of equation (1.10) verifies the observability inequality

\[
||\varphi(T)||_{L^2(0, \pi)}^2 \leq M_0 \exp \left( \frac{\zeta}{T_0} \right) \int_0^T \int_\omega |\varphi(t, x)|^2 dx dt.
\] (1.13)

To prove Theorem 1.2 we adopt the following strategy:

- We show that there exists a Riesz basis of \( L^2(0, \pi) \) formed by generalized eigenvectors of the operator \((D(A^*), A^*)\).

In order to do this we analyze in Section 2 the high part of the spectrum of \((D(A^*), A^*)\), we localize the sufficiently large eigenvalues \((\lambda_n)_{n \geq N} \) and we show that the corresponding
eigenvectors \((\psi_n)_{n \geq N}\) are geometrically simple and quadratically close to the orthonormal sequence \((\phi_n)_{n \geq N}\): 

\[
\sum_{n \geq N} \|\psi_n - \phi_n\|_{L^2(0, \pi)}^2 < \infty.
\]

From [9, Theorem 1] we know that there exist a number \(N_H \geq N\) and generalized eigenvectors \((\tilde{\psi}_n)_{1 \leq n \leq N_H - 1}\) of the operator \((D(A^t), A^t)\) such that \((\tilde{\psi}_n)_{1 \leq n \leq N_H - 1} \cup \psi)_{n \geq N_H}\) forms a Riesz basis \(B\) of \(L^2(0, \pi)\). The set of the eigenvalues corresponding to the generalized eigenvectors from \(B\) will be denoted by \(\Sigma = (\lambda_n)_{1 \leq n \leq N_L} \cup (\lambda_n)_{n \geq N_H}\).

We recall that \((f_n)_{n \geq 1}\) is a Riesz basis of a Hilbert space \(H\) if it is complete in \(H\) and there exist two positive constants \(c_1\) and \(c_2\) such that the following inequalities are verified

\[
(1.14) \quad c_1 \sum_{n \geq 1} |a_n|^2 \leq \left\| \sum_{n \geq 1} a_n f_n \right\|^2_H \leq c_2 \sum_{n \geq 1} |a_n|^2,
\]

for any finite sequence of scalars \((a_n)_{n \geq 1}\). For equivalent definitions and properties of Riesz basis the interested reader is referred to [14, Ch. 1, Sec. 8].

- By expanding the solution \(\varphi\) of (1.10) in the Riesz basis constructed above, we reduce the proof of inequality (1.13) to obtain and evaluate the norm of a biorthogonal sequence \((\theta_{n,j})_{1 \leq n \leq j \leq \eta - 1}\) in the family of functions \(\Lambda = (\nu e^{-\lambda t})_{\lambda \in \Sigma, 0 \leq j \leq \eta - 1}\) in \(L^2(-\frac{\pi}{2}, \frac{\pi}{2})\), where \(\eta > 1\) is the maximal dimension of the root linear space corresponding to the low eigenvalues \((\lambda_n)_{1 \leq n \leq N_L}\). This is done in Theorem 4.8 by adapting some ideas from [1] and [12].

We recall that, given a sequence \((f_n)_{n \geq 1}\) in the Hilbert space \(H\) endowed with the inner product \((\cdot, \cdot)\), \((g_n)_{n \geq 1}\) is a biorthogonal family to \((f_n)_{n \geq 1}\) in \(H\) if the following relations are verified

\[
(1.15) \quad (f_m, g_n)_H = \delta_{mn} \quad (n, m \geq 1).
\]

From Theorem 1.2 we can obtain the main result of this paper concerning the local controllability of (1.1) to the stationary states:

**Theorem 1.3.** Assume that \(f^S \in L^2(0, \pi)\) such that (1.2) admits a solution

\[
w^S \in H^2(0, \pi) \cap H^1_0(0, \pi), \quad w^S \neq 0.
\]

Let \(\omega \subset [0, \pi]\) be a non empty open set such that \(\partial_{xx} w^S\) is not identically zero in \(\omega\) and let \(T > 0\). Then there exists \(c_0 > 0\) such that for any \(w_0 \in H^1_0(0, \pi)\) with

\[
\|w_0 - w^S\|_{H^1_0(0, \pi)} \leq c_0,
\]

there exists a control \(u \in L^2(0, T; L^2(0, \pi))\) such that the solution \(w\) of (1.1) satisfies

\[
w(T) = w^S.
\]

In the above result, we assume that (1.2) admits a solution for some \(f^S\). Note that for an arbitrary \(f^S \in L^2(0, \pi)\), (1.2) may not have a solution. Nevertheless, it is easy to construct an infinite number of solutions of (1.2), even with the restriction that \(\partial_{xx} w^S\) does not cancel in \((0, \pi)\).

Notice that our controllability result holds for initial data in \(H^1_0(0, \pi)\). This is due to the fact that the solution \(w\) of (1.1) in Theorem 1.3 should be a strong solution. We obtain such a solution by a fixed point argument and we need in particular that \(w_0 \in H^1_0(0, \pi)\) and that \(w^S \in H^2(0, \pi) \cap H^1_0(0, \pi)\) to handle the nonlinear terms. Let us remark that even the well-posedness
for weak solutions of (1.1) (without control) is not an easy issue. Indeed, the compactness or completeness methods can not be applied directly with a regularity such as \( w \in L^\infty (0, T; L^2 (0, \pi)) \cap L^2 (0, T; H_0^1 (0, \pi)) \) because of the nonlinear term \( \nu (\| \partial_x u \|_{L^2 (0, \pi)}^2) \).

The aim of this section is to give a complete description of the high part of the spectrum of the main result Theorem 1.3. Finally, Section 6 is devoted to the proof of our observability inequality given by Theorem 1.2. Section 4 is devoted to the construction and the evaluation of a biorthogonal family to the set of functions \( \Lambda = \{ \nu e^{-\lambda t} \}_{\lambda \in \sigma(\Lambda)} \). This allows us to prove in Section 5 the observability inequality given by Theorem 1.2. Finally, Section 6 is devoted to the proof of our main result Theorem 1.3.

## 2 Spectral analysis

The aim of this section is to give a complete description of the high part of the spectrum of the operator \((D(A^*), A^*)\). First of all we have the following quite general result.

**Theorem 2.1.** The operator \((D(A^*), A^*)\) defined by (1.7) is an unbounded linear operator in \( L^2 (0, \pi) \) with compact resolvent. Its spectrum \( \sigma(A^*) \) consists of a sequence of isolated complex eigenvalues. To each eigenvalue \( \lambda \in \sigma(A^*) \) corresponds a finite dimensional root linear space \( G_\lambda \) (the space of generalized eigenvectors). Moreover, if \( D_0 = \| K \|_{L^2((0, \pi)^2)} + \| q \|_{L^\infty(0, \pi)} \), then we have that

\[
\sigma(A^*) = \{ \lambda \in \mathbb{C} : |\Im(\lambda)| \leq D_0, \Re(\lambda) \geq -D_0 \} .
\]

**Proof.** The fact that \((D(A^*), A^*)\) has compact resolvent follows from the compact embedding of \( H^2 (0, \pi) \) into \( L^2 (0, \pi) \). The classical spectral theory of compact operators ensures that the spectrum \( \sigma(A^*) \) consists of isolated complex eigenvalues and the root linear space \( G_\lambda \) corresponding to each eigenvalue \( \lambda \) is of finite dimension.

Let us now show that (2.1) holds. Given \( \lambda \in \sigma(A^*) \) there exists a function \( u \in D(A^*) \) with \( \| u \|_{L^2(0, \pi)} = 1 \) such that

\[
- \partial_{xx} u + \int_0^\pi K(\cdot, \xi) u(\xi) \, d\xi + qu = \lambda u .
\]

Multiplying (2.2) by \( \pi \) and integrating by parts we obtain that

\[
\int_0^\pi |\partial_x u(x)|^2 \, dx + \int_0^\pi \int_0^\pi K(x, \xi) u(\xi) \pi(\xi) \, d\xi \, dx + \int_0^\pi q(x) |u(x)|^2 \, dx = \lambda .
\]

By taking the imaginary part of (2.3) we get that

\[
|\Im(\lambda)| = \Im \left( \int_0^\pi \int_0^\pi K(x, \xi) u(\xi) \pi(\xi) \, d\xi \, dx + \int_0^\pi q(x) |u(x)|^2 \, dx \right) \\
\leq \| K \|_{L^2((0, \pi)^2)} + \| q \|_{L^\infty(0, \pi)},
\]

and the first relation in (2.1) follows.

By taking the real part of (2.3) we get that

\[
\Re(\lambda) = \int_0^\pi |\partial_x u(x)|^2 \, dx + \Re \left( \int_0^\pi \int_0^\pi K(x, \xi) u(\xi) \pi(\xi) \, d\xi \, dx + \int_0^\pi q(x) |u(x)|^2 \, dx \right) \\
\geq - \left( \| K \|_{L^2((0, \pi)^2)} + \| q \|_{L^\infty(0, \pi)} \right) ,
\]

and the second relation in (2.1) follows. The proof of the theorem is complete. \( \square \)
We pass to localize and describe the high eigenvalues of the operator \((D(A^*), A^*)\). In the sequel, given \(a \in \mathbb{C}\) and \(r \geq 0\), we denote by \(B(a, r)\) the ball in the complex plane of center \(a\) and radius \(r\). We localize the eigenvalues of the unbounded operator \((D(A^*), A^*)\) by using a strategy similar to the one presented in [11, Chapter 2] which combines the shooting method and the Rouché Theorem. Similar ideas have been employed to analyze the spectrum of several differential operators (see, for instance, [2, 4, 15]). In order to do that let us define the map

\[
G : \mathbb{C} \to \mathbb{C}, \quad G(\mu) = v(\pi),
\]
where \(v\) is the unique solution of the initial value problem

\[
\begin{cases}
-\partial_{xx}v(x) - \mu v(x) = 0 & x \in (0, \pi) \\
v(0) = 0 \\
\partial_x v(0) = 1.
\end{cases}
\]

We have the following immediate result.

**Proposition 2.2.** The value \(\mu \in \mathbb{C}\) is a root of the function \(G\) given by (2.4) if and only if it is an eigenvalue of the one dimensional Laplace operator \((D(\tilde{A}), \tilde{A})\),

\[
D(\tilde{A}) = H^2(0, \pi) \cap H^1_0(0, \pi), \quad \tilde{A}u = -\partial_{xx}u,
\]

i.e. there exists \(n \in \mathbb{N}^*\) such that \(\mu = n^2\).

Now, given \(D > 0\) and \(M > D^2\), let us set

\[
\Delta_{M,D} = \{ z \in \mathbb{C} : \Re(z) \geq M, \, |\Im(z)| \leq D \}.
\]

**Remark 2.3.** For our future computations we need to give some estimates of \(\sqrt{\mu}\) in the case when \(\mu \in \Delta_{M,D}\). If \(\mu \in \Delta_{M,D}\), it is easy to see that

\[
\Re(\sqrt{\mu}) \geq \sqrt{M}, \quad |\Im(\sqrt{\mu})| \leq \frac{D}{2\sqrt{M}}.
\]

Notice that, here and in the sequel, \(\sqrt{\mu}\) represents the principal branch of the square root function such that \(\sqrt{\mu} \in \mathbb{R}_+\), if \(\mu \in \mathbb{R}_+\).

We define the map

\[
F : \Delta_{D,M} \to \mathbb{C}, \quad F(\mu) = z(\pi),
\]
where \(z\) is the unique solution of the initial value problem

\[
\begin{cases}
-\partial_{xx}z(x) - \mu z(x) + \int_0^\pi K(x, \xi)z(\xi) \, d\xi + q(x)z(x) = 0 & x \in (0, \pi) \\
z(0) = 0 \\
\partial_x z(0) = 1.
\end{cases}
\]

Given \(D > 0\), let us show that there exists \(M > D^2\) such that \(F\) is well-defined in \(\Delta_{M,D}\), i.e. equation (2.10) has a unique solution \(z \in H^2(0, \pi)\) for each \(\mu \in \Delta_{M,D}\). We have the following result.

**Proposition 2.4.** Let us set

\[
C_{K,q} := 2\pi e^\pi \left( \|K\|_{L^2((0,\pi)^2)} + \|q\|_{L^\infty(0,\pi)} \right) = 2\pi e^\pi D_0.
\]

Given \(D > 0\), \(K \in L^2((0,\pi)^2)\) and \(q \in L^\infty(0, \pi)\), let \(M > 0\) be such that

\[
\max \{ D, C_{K,q} \} < \sqrt{M}.
\]
Then, for each $\mu \in \Delta_{M,D}$, the integro-differential equation (2.10) has a unique solution $z \in H^2(0, \pi)$ which verifies the following variation of constants formula

$$z(x) = \frac{1}{\sqrt{\mu}} \sin(\sqrt{\mu}x) + \frac{1}{\sqrt{\mu}} \int_0^x \sin(\sqrt{\mu}(x-s)) \left( \int_0^\pi K(s, \xi)z(\xi) \, d\xi + q(s)z(s) \right) \, ds \quad (x \in (0, \pi)),$$

(2.13)

and the following estimate

$$\|z\|_{L^\infty(0, \pi)} \leq \frac{2}{\sqrt{|\mu|}} e^{\frac{\pi |q|}{\sqrt{\mu}} r}.$$  

(2.14)

**Proof.** Given $f \in L^2(0, \pi)$ and $\mu \in \Delta_{M,D}$, let us consider the nonhomogeneous equation

$$\begin{align*}
-\partial_{xx} v(x) - \mu v(x) &= f(x) \quad x \in (0, \pi) \\
v(0) &= 0 \\
\partial_x v(0) &= 1,
\end{align*}$$

(2.15)

and remark that its unique solution $v \in H^2(0, \pi)$ is given by the following formula

$$v(x) = \frac{1}{\sqrt{\mu}} \sin(\sqrt{\mu}x) - \frac{1}{\sqrt{\mu}} \int_0^x \sin(\sqrt{\mu}(x-s)) f(s) \, ds \quad (x \in (0, \pi)).$$

(2.16)

With this in mind, we define the map

$$z \in L^2(0, \pi) \mapsto \mathcal{L}z \in L^2(0, \pi),$$

(2.17)

$$\mathcal{L}z(x) = \frac{1}{\sqrt{\mu}} \sin(\sqrt{\mu}x) + \frac{1}{\sqrt{\mu}} \int_0^x \sin(\sqrt{\mu}(x-s)) \left( \int_0^\pi K(s, \xi)z(\xi) \, d\xi + q(s)z(s) \right) \, ds.$$

We remark that $z$ verifies (2.13) if and only if it is a fixed point of the operator $\mathcal{L}$. We show that, by choosing $M$ as in (2.12), $\mathcal{L}$ becomes a contraction in $L^2(0, \pi)$ for each $\mu \in \Delta_{M,D}$. Indeed, given $z_1, z_2 \in L^2(0, \pi)$ and taking into account (2.8), we obtain that

$$\begin{align*}
\|\mathcal{L}z_1 - \mathcal{L}z_2\|_{L^2(0, \pi)} &\leq \sqrt{\frac{\pi}{|\mu|}} e^{\frac{\pi |q|}{\sqrt{\mu}} r} \left( \|K\|_{L^2((0, \pi)^2)} + \|q\|_{L^\infty(0, \pi)} \right) \|z_1 - z_2\|_{L^2(0, \pi)} \\
&\leq \sqrt{\frac{\pi}{M}} e^{\frac{\pi |q|}{\sqrt{\mu}} r} \left( \|K\|_{L^2((0, \pi)^2)} + \|q\|_{L^\infty(0, \pi)} \right) \|z_1 - z_2\|_{L^2(0, \pi)}.
\end{align*}$$

(2.18)

Since (2.12) implies that

$$\begin{align*}
\sqrt{\frac{\pi}{M}} e^{\frac{\pi |q|}{\sqrt{\mu}} r} \left( \|K\|_{L^2((0, \pi)^2)} + \|q\|_{L^\infty(0, \pi)} \right) &\leq \sqrt{\frac{1}{4\pi}} < 1,
\end{align*}$$

(2.19)

from (2.18) it follows that $\mathcal{L}$ is a contraction in $L^2(0, \pi)$ for each $\mu \in \Delta_{M,D}$. Hence, in this case, there exists a unique $z \in L^2(0, \pi)$ which verifies (2.13).

It is easy to see that, if $z \in L^2(0, \pi)$ verifies (2.13), with $K \in L^2((0, \pi)^2)$ and $q \in L^\infty(0, T)$, then in fact $z \in H^2(0, \pi)$ and it is the unique solution of (2.10). Hence, it remains to prove (2.14). We have that, for each $x \in (0, \pi)$, the following estimate holds

$$\begin{align*}
|z(x)| &\leq \frac{1}{\sqrt{|\mu|}} e^{\frac{\pi |q|}{\sqrt{\mu}} r} + \frac{\pi}{\sqrt{|\mu|}} e^{\frac{\pi |q|}{\sqrt{\mu}} r} \left( \|K\|_{L^2((0, \pi)^2)} + \|q\|_{L^\infty(0, \pi)} \right) \|z\|_{L^\infty(0, \pi)}.
\end{align*}$$

(2.20)
Since (2.12) implies that, for any \( \mu \in \Delta_{M,D} \), we have
\[
\frac{\pi}{\sqrt{\|\mu\|}} e^{\pi |\beta(\sqrt{\mu})|} (\|K\|_{L^2((0,\pi)^2)} + \|q\|_{L^\infty((0,\pi))}) \leq \frac{\pi}{\sqrt{M}} e^{\pi |\beta|} (\|K\|_{L^2((0,\pi)^2)} + \|q\|_{L^\infty((0,\pi))}) \leq \frac{1}{2},
\]
from (2.20) and (2.8) we deduce that (2.14) holds true. The proof of the proposition is now complete. \( \Box \)

**Remark 2.5.** If \(|\mu|\) is not sufficiently large, equation (2.10) may have multiple solution. For instance, in the case \( q \equiv 0 \), we have the following result.

**Proposition 2.6.** Assume that \( \mu \in \mathbb{C}^* \) and let \( \alpha, \beta \in L^2(0,\pi) \) be such that
\[
(2.21) \quad \sqrt{\mu} = \int_0^\pi \beta(x) \int_0^x \sin(\sqrt{\mu}(x-s)) \alpha(s) \, ds \, dx,
\]
where \( \sqrt{\mu} \) is a square root of \( \mu \). Then for any \( \vartheta \in \mathbb{C} \), \( w \) given by
\[
(2.22) \quad w(x) = \frac{\partial}{\sqrt{\mu}} \int_0^x \sin(\sqrt{\mu}(x-s)) \alpha(s) \, ds,
\]
is a solution of
\[
(2.23) \quad \begin{cases} 
-\partial_{xx} w(x) + \int_0^\pi K(x,\xi)w(\xi) \, d\xi = \mu w(x) & x \in (0,\pi) \\
w(0) = \partial_x w(0) = 0
\end{cases}
\]
with \( K(x,\xi) = \alpha(x)\beta(\xi) \) (degenerate kernel). In particular, for any \( \mu \in \mathbb{C}^* \), there exists \( K \in L^2((0,\pi)^2) \) such that (2.23) has nontrivial solutions.

**Remark 2.7.** If \( \mu = 0 \), we can replace (2.21) by
\[
1 = \int_0^\pi \beta(x) \int_0^x (x-s)\alpha(s) \, ds \, dx
\]
and (2.22) by
\[
w(x) = \vartheta \int_0^x (x-s)\alpha(s) \, ds.
\]

**Proof of Proposition 2.6.** If \( \vartheta \) denotes the number \( \int_0^\pi \beta(\xi)w(\xi) \, d\xi \), we have that the solution \( w \) of (2.23) is given by (2.22). Thus, \( \vartheta \) is solution of
\[
(2.24) \quad \vartheta = \frac{\partial}{\sqrt{\mu}} \int_0^\pi \beta(x) \int_0^x \sin(\sqrt{\mu}(x-s)) \alpha(s) \, ds \, dx.
\]
From (2.24) we deduce that there exists two possibilities:

1. Relation (2.21) does not hold. In this case \( \vartheta = 0 \) and the unique solution of (2.23) is the trivial one.

2. Relation (2.21) holds. In this case any \( w \) given by (2.22) with \( \vartheta \in \mathbb{C} \) is a solution of (2.23) and the space of solutions of (2.23) is of dimension one.

We notice that, given any \( \mu \in \mathbb{C}^* \) and \( \alpha \in L^2(0,\pi) \), \( \alpha \neq 0 \), there exists \( \beta \in L^2(0,\pi) \) such that (2.21) holds. \( \Box \)
Remark 2.8. We can show that, in the case of a degenerate kernel \( K(x, \xi) = \alpha(x)\beta(\xi) \) with \( \alpha, \beta \in L^2(0, \pi) \), the geometric multiplicity of any eigenvalue \( \lambda \) of the operator \( (D(A^*), A^*) \) is at most two. Indeed, let \( \lambda \in \mathbb{C} \) be an eigenvalue of the operator \( (D(A^*), A^*) \), i.e. there exists \( \varphi \in D(A^*) \) with \( \|\varphi\|_{L^2(0, \pi)} = 1 \) such that

\[
\begin{split}
-\partial_{xx}\varphi(x) + \int_0^\pi K(x, \xi)\varphi(\xi)\,d\xi + q(x)\varphi(x) &= \lambda\varphi(x) \quad x \in (0, \pi) \\
\varphi(0) &= \varphi(\pi) = 0.
\end{split}
\]

Also, let \( \phi^1 \) and \( \phi^2 \) be the unique solutions of the equations

\[
\begin{split}
-\partial_{xx}\phi^1(x) + q(x)\phi^1(x) &= \lambda\phi^1(x) \quad x \in (0, \pi) \\
\phi^1(0) &= 1, \quad \partial_x\phi^1(0) = 0,
\end{split}
\]

and

\[
\begin{split}
-\partial_{xx}\phi^2(x) + q(x)\phi^2(x) &= \lambda\phi^2(x) \quad x \in (0, \pi) \\
\phi^2(0) &= 0, \quad \partial_x\phi^2(0) = 1,
\end{split}
\]

respectively. Any solution of the non homogeneous problem

\[
\begin{split}
-\partial_{xx}\phi(x) + q(x)\varphi(x) &= \lambda\phi(x) + f(x) \quad x \in (0, \pi) \\
\phi(0) &= a, \quad \partial_x\phi(0) = b,
\end{split}
\]

can be written as follows

\[
\begin{split}
\phi(x) &= (a\phi^1(x) + b\phi^2(x)) - \int_0^x H(x, s)f(s)\,ds \quad (x \in (0, \pi)),
\end{split}
\]

where

\[
H(x, s) = \frac{\phi^1(s)\phi^2(x) - \phi^1(x)\phi^2(s)}{\phi^1(s)\partial_x\phi^2(s) - \partial_x\phi^1(s)\phi^2(s)}.
\]

From this formula, we obtain that any eigenfunction \( \varphi \) verifying (2.25) is of the following form

\[
\begin{split}
\varphi(x) &= \partial_x\varphi(0)\phi^2(x) + \vartheta \int_0^x H(x, s)\alpha(s)\,ds \quad (x \in (0, \pi)),
\end{split}
\]

where \( \vartheta = \int_0^\pi \beta(\xi)\varphi(\xi)\,d\xi \).

By taking into account the above considerations we have that the following two cases are possible for the eigenspace \( \mathcal{E}_\lambda = \{v \in D(A^*): A^*v = \lambda v\} \) corresponding to \( \lambda \):

1. \( 1 \neq \int_0^\pi \beta(x) \int_0^x H(x, s)\alpha(s)\,ds\,dx \), then the eigenspace \( \mathcal{E}_\lambda \) is one dimensional and it is generated by the unique solution of the equation

\[
\begin{split}
-\partial_{xx}w(x) + \int_0^\pi K(x, \xi)w(\xi)\,d\xi + q(x)w(x) &= \lambda w(x) \quad x \in (0, \pi) \\
w(0) &= 0, \quad \partial_xw(0) = 1.
\end{split}
\]

2. \( 1 = \int_0^\pi \beta(x) \int_0^x H(x, s)\alpha(s)\,ds\,dx \), then we have the following possibilities

(a) \( \int_0^\pi \phi^2(s)\beta(s)\,ds = 0 \), \( \int_0^\pi H(\pi, s)\alpha(s)\,ds = 0 \) and \( \phi^2(\pi) = 0 \) (i.e. \( \lambda \) is an eigenvalue of the operator \( -\partial_{xx} + q \)), then the space \( \mathcal{E}_\lambda \) is two dimensional and it is generated by the functions

\[
\phi^2(x), \quad \int_0^x H(x, s)\alpha(s)\,ds.
\]
(b) Otherwise, the eigenspace $E_{\lambda}$ is one dimensional.

The following immediate property of the function $F$ is very important in the sequel and justifies the introduction of $F$.

**Proposition 2.9.** Assume that (2.12) holds true. Then the value $\mu \in \Delta_{M,D}$ is a root of the function $F$ if and only if it is an eigenvalue of the operator $(D(A^*), A^*)$.

According to Proposition 2.9 if we want to find the eigenvalues of the operator $(D(A^*), A^*)$ from $\Delta_{M,D}$, it is sufficient to look for the roots of $F$ in this domain. We shall localize the large roots of $F$ by using the Rouché Theorem. Firstly, we have to prove the following three lemmas.

**Lemma 2.10.** Given $D > 0$ and $M$ satisfying (2.12), the following estimate holds

$$
(2.32) \quad |F(\mu) - G(\mu)| \leq \frac{C_{K,q}}{|\mu|} (\mu \in \Delta_{M,D}).
$$

**Proof.** We have that

$$
F(\mu) - G(\mu) = z(\pi) - v(\pi) := w(\pi),
$$

where $w$ is the unique solution of

$$
(2.33) \quad \left\{ \begin{array}{l}
-\partial_{xx}w(x) - \mu w(x) + \int_{0}^{\pi} K(x, \xi)z(\xi)\,d\xi + q(x)z(x) = 0 \quad x \in (0, \pi) \\
 w(0) = \partial_x w(0) = 0.
\end{array} \right.
$$

Since the solution of (2.33) is given by

$$
(2.34) \quad |w(x)| \leq \frac{\pi}{\sqrt{|\mu|}} e^{\pi |3(\sqrt{\mu})|} \left( \|K\|_{L^2((0,\pi)^2)} + \|q\|_{L^\infty(0,\pi)} \right) \|z\|_{L^\infty(0,\pi)} \quad (x \in (0, \pi)).
$$

From (2.14) and (2.34) it follows that

$$
|w(\pi)| \leq \frac{2\pi}{|\mu|} e^{\frac{\pi}{\sqrt{2M}}} \left( \|K\|_{L^2((0,\pi)^2)} + \|q\|_{L^\infty(0,\pi)} \right).
$$

Since $M > D^2$, the above inequality implies that (2.32) holds.

Given $\delta > 0$, for each $n \in \mathbb{N}$, we define the circles

$$
(2.35) \quad \Gamma_n(\delta) = \{ z \in \mathbb{C} : |z - n^2| = \delta \} = \partial B(n^2, \delta).
$$

Also, we define the set

$$
(2.36) \quad S(\delta) = \{ z \in \Delta_{M,D} : |z - n^2| \geq \delta, \forall n \geq 0 \}.
$$

**Lemma 2.11.** Given $\delta > 0$, $D > 0$ and $M$ satisfying (2.12), the function $G$ defined by (2.4) verifies the following inequality

$$
(2.37) \quad |G(\mu)| \geq \frac{2\delta}{3|\mu|} \quad (\mu \in S(\delta), \quad |\mu| \geq \frac{1}{2}).
$$
By taking into account (2.8) and (2.12), it follows from (2.41) that
\[ |a - n_a| \leq \frac{1}{2}, \]
we have that
\[ |\sin(\sqrt{\mu} \pi)|^2 = |\sin((a + ib) \pi)|^2 = \frac{1}{4} (e^{2b\pi} + e^{-2b\pi} - 2\cos(2a\pi)) \]
\[ \geq b^2\pi^2 + \sin^2(a\pi) = b^2\pi^2 + \sin^2((a - n_a)\pi). \]  
(2.39)

Inequality (2.38), together with the facts that \( \mu \in \Delta_{M,D} \) (see (2.8)) and \( M > D^2 \), implies that
\[ |\sqrt{\mu} - n_a|^2 = |a - n_a|^2 + |b|^2 \leq \frac{1}{4} + \left( \frac{D}{2\sqrt{M}} \right)^2 \leq \frac{1}{2}. \]

Since, for \( |\sqrt{\mu}| \geq \frac{1}{\sqrt{2}} \), we have that
\[ |\sqrt{\mu} + n_a| \leq |\sqrt{\mu} - n_a| + 2|\sqrt{\mu}| \leq \frac{1}{\sqrt{2}} + 2|\sqrt{\mu}| \leq 3|\sqrt{\mu}|, \]
from (2.39) and (2.38) we deduce that, for any \( \mu \in S(\delta) \), we have that
\[ |\sin(\sqrt{\mu}\pi)|^2 \geq 4b^2 + 4(a - n_a)^2 = 4|\sqrt{\mu} - n_a|^2 \geq \frac{4\delta^2}{|\sqrt{\mu} + n_a|^2} \geq \frac{4\delta^2}{9|\mu|}. \]

From the last inequality it follows immediately that (2.37) is verified if \( |\sqrt{\mu}| \geq \frac{1}{\sqrt{2}} \) and the proof ends.

**Lemma 2.12.** Given \( D > 0 \) and \( M \) satisfying (2.12), the functions \( G : \mathbb{C} \to \mathbb{C} \) and \( F : \Delta_{M,D} \to \mathbb{C} \), given by (2.4) and (2.9) respectively, are analytic in their domains of definition.

**Proof.** Since \( G(\mu) = \frac{1}{\sqrt{\mu}} \sin(\sqrt{\mu}\pi) \), it follows immediately that \( G \) is an entire function. Let us prove the property for \( F \). We recall that, according to Proposition 2.4, for each \( \mu \in \Delta_{M,D} \), there exists a unique solution \( z = z(\cdot, \mu) \in H^2(0, \pi) \) of equation (2.13). Let us define the Picard’s recurrent sequence of functions
\[
\begin{align*}
  z_0(x, \mu) &= \frac{1}{\sqrt{\mu}} \sin(\sqrt{\mu}x), \\
  z_{n+1}(x, \mu) &= z_0(x, \mu) \\
  &+ \int_0^x \frac{\sin(\sqrt{\mu}(x - s))}{\sqrt{\mu}} \left( \int_0^x K(s, \xi)z_n(\xi, \mu) \, d\xi + q(s)z_n(s, \mu) \right) \, ds, \quad (n \geq 0).
\end{align*}
\]
(2.40)

We have that
\[ \| (z_{n+1} - z_n)(\cdot, \mu) \|_{L^\infty(0, \pi)} \leq \frac{\pi}{\sqrt{|\mu|}} e^{3|\sqrt{\mu}|\pi^2} \left( \| K \|_{L^2((0, \pi)^2)} + \| q \|_{L^\infty(0, \pi)} \right) \| (z_n - z_{n-1})(\cdot, \mu) \|_{L^\infty(0, \pi)}. \]  
(2.41)

By taking into account (2.8) and (2.12), it follows from (2.41) that
\[ \| (z_{n+1} - z_n)(\cdot, \mu) \|_{L^\infty(0, \pi)} \leq \frac{1}{2} \| (z_n - z_{n-1})(\cdot, \mu) \|_{L^\infty(0, \pi)}. \]  
(2.42)
Hence, the series $\sum_{n \geq 0} (z_{n+1} - z_n)(\cdot, \mu)$ converges in $C[0, \pi]$ and since

$$\|z_0(\cdot, \mu)\|_{L^\infty(0, \pi)} \leq \frac{1}{\sqrt{M}} e^{\pi |3\sqrt{M}|} \leq \frac{1}{\sqrt{M}} e^{\frac{9}{2}},$$

this convergence is uniformly in $\mu \in \Delta_{M,D}$. Since

$$\sum_{n=0}^k (z_{n+1} - z_n)(\cdot, \mu) = z_{k+1}(\cdot, \mu) - z_0(\cdot, \mu),$$

it follows that the sequence $(z_n(\cdot, \mu))_{n \geq 0}$ converges in $C[0, \pi]$ as $n$ tends to infinity, uniformly in $\mu \in \Delta_{M,D}$. In fact, the limit of the sequence $(z_n(\cdot, \mu))_{n \geq 0}$ is the unique solution $z(\cdot, \mu)$ of (2.13) encountered in Proposition 2.4. It follows that the sequence $(z_n(\pi, \mu))_{n \geq 0}$ converges to $z(\pi, \mu)$ as $n$ tends to infinity, uniformly in $\mu \in \Delta_{M,D}$. Since each $z_n$ depends analytically of $\mu$ in $\Delta_{M,D}$, it follows that $F(\mu) = z(\pi, \mu)$ is analytic in $\Delta_{M,D}$ and the proof of the lemma is now complete.

We have now all the ingredients needed to apply the Rouché Theorem and to localize the zeros of $F$ from the region $\Delta_{M,D}$. In the sequel $|\cdot|$ denotes the floor function.

**Theorem 2.13.** There exists $\delta > 0$, such that for any $D > \delta$ and $N \geq \max\{|2\delta|, |D| + 1\}$, there exists $M$ satisfying (2.12) and having the following property: for each $n \geq N + 1$, the function $F$ has a unique root $\lambda_n$ inside the circle $\Gamma_n(\delta)$ defined by (2.35). Moreover, the roots of the function $F$ in $\Delta_{M,D}$ are exactly $(\lambda_n)_{n \geq N+1}$.

**Proof.** We recall that $C_{K,q}$ is defined by (2.11). We choose $\delta = \frac{3C_{K,q}}{2} + 1$ and let $D > \delta$. From the choice of $N$ we deduce that $(N + 1)^2 - \delta > N^2 + \delta$ and we can take $M$ such that

$$(N + 1)^2 - \delta > M > N^2 + \delta.$$  

From the above relations we have, in particular, that $M$ satisfies (2.12) and

$$\Gamma_n(\delta) \subset \Delta_{M,D} \quad (n \geq N + 1).$$

From Lemmas 2.10, 2.11 and the choice of $\delta$ it follows that, for each $n \geq N + 1$, we have that

$$|F(\mu) - G(\mu)| \leq \frac{C_{K,q}}{\mu} < \frac{2\delta}{3|\mu|} \leq |G(\mu)| \quad (\mu \in \Gamma_n(\delta)).$$

Moreover, Lemma 2.12 ensures that $F$ and $G$ are analytic functions in $\Delta_{M,D}$. From the Rouché Theorem we deduce that, for each $n \geq N + 1$, there exists a simple root $\lambda_n$ of $F$ inside the contour $\Gamma_n(\delta) \subset \Delta_{M,D}$. On the other hand, by using estimate (2.37) from Lemma 2.11 it follows that

$$|F(\mu) - G(\mu)| < |G(\mu)| \quad (\mu \in S(\delta)).$$

This implies that there are no other roots of the function $F$ in $\Delta_{M,D}$. \hfill $\square$

We pass to prove some properties of the associated eigenvectors.

**Lemma 2.14.** Under the hypothesis of Theorem 2.13, for each $n \geq N + 1$, let $\phi_n(x) = \sqrt{\frac{2}{\pi \mu}} \sin(\mu x)$ and $\psi_n(x) = \sqrt{\frac{2}{\pi \mu}} \sin(\mu x, \lambda_n)$, where $z(\cdot, \lambda_n)$ is the solution of (2.10) with $\mu = \lambda_n$. The following properties are verified

1. There exist two positive constants $\rho_1$ and $\rho_2$ such that

$$\rho_1 \leq \|\psi_n\|_{L^2(0, \pi)} \leq \rho_2 \quad (n \geq N + 1);$$

$$\rho_1 \leq \|\psi_n\|_{L^2(0, \pi)} \leq \rho_2 \quad (n \geq N + 1);$$

...
2. There exists a positive constant $\rho_3$ such that

\begin{equation}
\|\psi_n - \phi_n\|_{L^2(0,\pi)} \leq \frac{\rho_3}{n} \quad (n \geq N + 1).
\end{equation}

3. If $\omega$ is a non empty open subset of $[0,\pi]$, then there exists a positive constant $\rho_4$ such that

\begin{equation}
\int_\omega |\psi_n(x)|^2 \, dx \geq \rho_4 \quad (n \geq N + 1).
\end{equation}

**Proof.** We remark that $\phi_n$ is the solution of the equation

\begin{equation}
\begin{cases}
-\partial_{xx}\phi_n(x) - n^2\phi_n(x) = 0 & x \in (0, \pi) \\
\phi_n(0) = \phi_n(\pi) = 0 \\
\partial_x\phi_n(0) = \sqrt{\frac{2}{\pi}} n,
\end{cases}
\end{equation}

whereas $\psi_n$ is the solution of the equation

\begin{equation}
\begin{cases}
-\partial_{xx}\psi_n(x) - \lambda_n\psi_n(x) + \int_0^\pi K(x, \xi)\psi_n(\xi) \, d\xi + q(x)\psi_n(x) = 0 & x \in (0, \pi) \\
\psi_n(0) = \psi_n(\pi) = 0 \\
\partial_x\psi_n(0) = \sqrt{\frac{2}{\pi}} n.
\end{cases}
\end{equation}

To prove (2.45), we use (2.49) to deduce that

\begin{equation}
\psi_n(x) = \phi_n(x) + \frac{1}{n} \int_0^x \sin(n(x - s)) \left( (n^2 - \lambda_n)\psi_n(s) + \int_0^\pi K(s, \xi)\psi_n(\xi) \, d\xi + q(s)\psi_n(s) \right) \, ds.
\end{equation}

From (2.50) and the fact that $|n^2 - \lambda_n| \leq \delta$ it follows that

\[
\|\psi_n\|_{L^2(0,\pi)} - \|\phi_n\|_{L^2(0,\pi)} \leq \frac{\pi}{n} \left( \delta + \|K\|_{L^2((0,\pi)^2)} + \|q\|_{L^\infty((0,\pi))} \right) \|\psi_n\|_{L^2(0,\pi)}.
\]

From the last estimate, by using that $\|\phi_n\|_{L^2(0,\pi)} = 1$ and that, for $n \geq \max\{N + 1, 4\pi \delta\}$,

\[
\pi \left( \delta + \|K\|_{L^2((0,\pi)^2)} + \|q\|_{L^\infty((0,\pi))} \right) < 2\pi \delta \leq \frac{n}{2},
\]

we obtain that (2.45) holds with

\[
\rho_1 = \min\left\{ \frac{2}{3}, \min_{N+1 \leq n \leq 4\pi \delta} \|\psi_n\|_{L^2(0,\pi)} \right\}, \quad \rho_2 = \max\left\{ 2, \max_{N+1 \leq n \leq 4\pi \delta} \|\psi_n\|_{L^2(0,\pi)} \right\}.
\]

Let us pass to prove (2.46). If we put $\zeta_n = \psi_n - \phi_n$, it follows that $\zeta_n$ verifies the following relation

\begin{equation}
\zeta_n(x) = \frac{1}{n} \int_0^x \sin(n(x - s)) \left( \int_0^\pi K(s, \xi)\psi_n(\xi) \, d\xi + q(s)\psi_n(s) + (n^2 - \lambda_n)\psi_n(s) \right) \, ds.
\end{equation}

Since, according to Theorem 2.13 $|\lambda_n - n^2| \leq \delta$, we deduce from (2.51) that

\begin{equation}
\|\zeta_n\|_{L^2(0,\pi)} \leq \frac{\pi}{n} \left( \|K\|_{L^2((0,\pi)^2)} + \|q\|_{L^\infty((0,\pi))} + \delta \right) \|\psi_n\|_{L^2(0,\pi)}.
\end{equation}

From (2.52) we deduce, by taking into account the second inequality in (2.45), that (2.46) holds true with $\rho_3 = 2\pi \rho_2$. 

14
On the other hand, from (2.46), we deduce that
\[
\int_\Omega |\psi_n(x)|^2 \, dx \geq \frac{1}{\pi} \int_\Omega |\sin(nx)|^2 \, dx - \int_\Omega \left| \psi_n(x) - \sqrt{\frac{2}{\pi}} \sin(nx) \right|^2 \, dx \geq \frac{1}{\pi} \int_\Omega |\sin(nx)|^2 \, dx - \frac{\rho_3^2}{n^2},
\]
from which we deduce that there exists \( N_1 \geq N + 1 \) and a constant \( \rho' > 0 \) such that
\[
(2.53) \quad \int_\Omega |\psi_n(x)|^2 \, dx \geq \rho' \quad (n \geq N_1).
\]
Relation (2.53) follows with
\[
\rho_3 = \min \left\{ \rho', \min_{N+1 \leq n \leq N_1} \left\{ \int_\Omega |\psi_n(x)|^2 \, dx \right\} \right\}
\]
and the proof of the lemma is complete. \( \square \)

To solve our control problem we shall also need the following unique continuation principle for the solutions of equation (2.10).

**Lemma 2.15.** Suppose that the kernel \( K \) is degenerate, i.e. there exist two functions \( \alpha, \beta \in L^2(0, \pi) \) such that
\[
K(x, \xi) = \alpha(x) \beta(\xi) \quad \text{for each} \quad (x, \xi) \in [0, \pi]^2.
\]
Let \( \mu \in \mathbb{C} \) and let \( z \in H^2(0, \pi) \) be any solution of equation
\[
(2.54) \quad -\partial_{xx} z(x) + \int_0^\pi K(x, \xi) z(\xi) \, d\xi + q(x) z(x) = \mu z(x) \quad (x \in (0, \pi)),
\]
with the property that there exists a non empty open interval \((a, b) \subset [0, \pi]\) such that \( z \) vanishes in \((a, b)\) and \( \alpha \) is not identically zero in \((a, b)\). Then \( z \) is identically zero in \([0, \pi]\).

**Proof.** By taking into account the particular form of the kernel \( K \) and equation (2.54) verified by \( z \), we obtain that
\[
\alpha(x) \int_0^\pi \beta(\xi) z(\xi) \, d\xi = 0 \quad (x \in (a, b)).
\]
Since \( \alpha \) is not identically zero in \((a, b)\) it follows that \( \int_0^\pi \beta(\xi) z(\xi) \, d\xi = 0 \). Let \( x_0 \in (a, b) \) and notice that \( z(x_0) = \partial_x z(x_0) = 0 \). From the uniqueness of solutions of the equation
\[
\begin{cases}
-\partial_{xx} z(x) + (q(x) - \mu) z(x) = 0 \\
z(x_0) = \partial_x z(x_0) = 0,
\end{cases}
\]
in \((0, x_0)\) and \((x_0, \pi)\), we deduce that \( z \) is identically zero in \([0, \pi]\) and the proof ends. \( \square \)

**Remark 2.16.** The degeneracy hypothesis of the kernel \( K \) is verified in the case of our model (1.6). It seems that, for kernels that are not degenerate, additional conditions should be imposed in order to ensure that the unique continuation property holds. For instance, in [8] an assumption of analyticity of the kernel is used in order to solve a multidimensional control problem.

**Remark 2.17.** The hypothesis that \( \alpha \) is not identically zero in \((a, b)\) is necessary since it is easy to construct in this case a nonzero function \( z \) verifying (2.54) which vanishes in \((a, b)\).

Let us summarize the most important results concerning the high part of the spectrum of the operator \((D(A^*), A^*)\) in the following theorem.
Theorem 2.18. There exist $N \in \mathbb{N}$ and $\delta > 0$ such that, for each $n \geq N + 1$, $\sigma(A^*) \cap B(n^2, \delta)$ is reduced to one element that we denote by $\lambda_n$ and

\begin{equation}
\sigma(A^*) \setminus B(0, (N + 1)^2 - \delta) = \{\lambda_n, \ n \geq N + 1\}.
\end{equation}

Moreover, for any $n \geq N + 1$, the eigenvalue $\lambda_n$ is geometrically simple and there exists an eigenvector $\psi_n$ of $A^*$ corresponding to $\lambda_n$ such that

\begin{equation}
\|\psi_n - \phi_n\|_{L^2(0, \pi)} \leq \frac{\rho}{n},
\end{equation}

where $\phi_n(x) = \sqrt{\frac{2}{\pi}} \sin(nx)$ and $\rho$ is a positive constant independent of $n$.

Proof. Let $D_0 > 0$ be the constant from Theorem 2.1. Also, let $D, M, N \in \mathbb{N}$ and $\delta > 0$ be given by Theorem 2.13 with $D \geq D_0$. According to Proposition 2.9 and Theorem 2.13 there exists a unique eigenvalue $\lambda_n$ of the operator $(D(A^*), A^*)$ in each ball $B(n^2, \delta)$ for $n \geq N + 1$ and there are no other eigenvalues of this operator in $\Delta_{M, D}$. By taking into account relations (2.1) from Theorem 2.1, we obtain that (2.55) is verified, too. Due to the uniqueness of solutions to problem (2.10) proved in Proposition 2.4, if $n \geq N + 1$, to each $\lambda_n$ corresponds a one dimensional eigenspace generated by the function $\psi_n$ defined in Lemma 2.14. Finally, estimate (2.56) for $\psi_n$ follows from (2.46) and the proof of the theorem is complete.

3 Riesz basis

The analysis of the eigenfunctions $(\psi_n)_{n \geq N + 1}$ in the previous section and a result from [13] Theorem 1 allow us to obtain a Riesz basis of $L^2(0, \pi)$.

Theorem 3.1. Let $N$ be the entire number and $(\psi_n)_{n \geq N + 1}$ be the eigenvectors given by Theorem 2.18. There exist $N_H, N_L \in \mathbb{N}$, with $N_H > \max\{N + 1, N_L\}$ and a Riesz basis $\mathcal{B}$ of $L^2(0, \pi)$ such that

\begin{equation}
\mathcal{B} = (\tilde{\psi}_k)_{k \geq N_H} \cup (\tilde{\psi}_k)_{1 \leq k \leq N_H - 1},
\end{equation}

where $(\tilde{\psi}_k)_{1 \leq k \leq N_H - 1}$ are generalized eigenvectors of the operator $(D(A^*), A^*)$ corresponding to $N_L$ different eigenvalues of $A^*$, $\lambda_1, \ldots, \lambda_{N_L}$, satisfying

\begin{equation}
|\lambda_n| < |\lambda_{N_H}| \quad (1 \leq n \leq N_L).
\end{equation}

Proof. The result follows immediately from [13] Theorem 1, by taking into account that $(D(A^*), A^*)$ is a densely defined operator with compact resolvent in $L^2(0, \pi)$, $(\phi_n)_{n \geq 1}$ is an orthonormal basis of $L^2(0, \pi)$ and $(\psi_k)_{k \geq N + 1}$ verify (2.56).

Let us use Theorem 3.1 in order to expand the functions from $L^2(0, \pi)$ and to write the solutions of (1.10). Firstly, let us denote the family of distinct eigenvalues corresponding to all the eigenvectors $(\psi_k)_{k \geq N_H}$ and generalized eigenvectors $(\tilde{\psi}_k)_{1 \leq k \leq N_H - 1}$ from Theorem 3.1 by

\begin{equation}
\Sigma = \Sigma^L \cup \Sigma^H = (\lambda_k)_{1 \leq k \leq N_L} \cup (\lambda_k)_{k \geq N_H} \subset \mathbb{C}.
\end{equation}

We recall that, according to Theorem 2.18 if $k \geq N_H$, the element $\psi_k$ from the basis $\mathcal{B}$ generates the one dimensional eigenspace corresponding to $\lambda_k$.

On the other hand, for any $1 \leq k \leq N_L$, let us consider a Jordan basis of the root space of $A^*$ associated to the eigenvalue $\lambda_k$:

\begin{equation}
\psi_{k,j,m} \quad 1 \leq k \leq N_L, \ 1 \leq j \leq d_k, \ 0 \leq m \leq r_{k,j} - 1.
\end{equation}
More precisely, for a given $k$, $\{\psi_{k,j,m}\}$ is a family of generalized eigenvectors of $A^*$ associated with the eigenvalue $\lambda_k$ with the following property

$$\psi_{k,j,0} \in \ker(A^* - \lambda_k I), \quad (A^* - \lambda_k I)\psi_{k,j,m} = -\psi_{k,j,m-1} \quad 1 \leq m \leq r_{k,j} - 1, \quad 1 \leq j \leq d_k,$$

and the family in $(3.4)$ is linearly independent. Note that

$$\ker(A^* - \lambda_k I) = \text{Span}\{\psi_{k,j,0}, 1 \leq j \leq d_k\}.$$

We remark that not all the generalized eigenvectors $(\psi_{k,j,m})_{1 \leq k \leq N_L, 1 \leq j \leq d_k, 0 \leq m < r_{k,j} - 1}$ belong necessarily to the Riesz basis $B$ given by Theorem 3.1. However, in order to simplify the notation, we shall write that any function $\phi_0 \in L^2(0, \pi)$ can be uniquely written as

$$(3.5) \quad \phi_0 = \sum_{k=1}^{N_L} \sum_{j=1}^{d_k} \sum_{m=0}^{r_{k,j}-1} a_{k,j,m} \psi_{k,j,m} + \sum_{k=N_H}^{\infty} a_k \psi_k,$$

where in $(3.5)$ we shall consider that $a_{k,j,m} = 0$ if $\psi_{k,j,m} \notin B$.

Now, if $\phi_0 \in L^2(0, \pi)$ is given by $(3.5)$, then the corresponding solution $\phi$ of $(1.10)$ can be written under the following form

$$(3.6) \quad \phi(t) = \sum_{k=1}^{N_L} \sum_{j=1}^{d_k} \sum_{m=0}^{r_{k,j}-1} a_{k,j,m} \left( \sum_{s=0}^{m} \frac{t^s}{s!} \psi_{k,j,m-s} \right) e^{-\lambda_k t} + \sum_{k=N_H}^{\infty} a_k \psi_k e^{-\lambda_k t}.$$

We shall need to rewrite the solution $\phi$ in a slightly different way. Let us set for $k = 1, \ldots, N_L$,

$$(3.7) \quad R_k := \max\{r_{k,j}, \quad j = 1, \ldots, d_k\},$$

and

$$(3.8) \quad \mathcal{I}_{k,p} := \{j \in \{1, \ldots, d_k\} \mid r_{k,j} = R_k - p\} \quad (0 \leq p \leq R_k - 1).$$

Then we can rewrite $(3.6)$ as

$$(3.9) \quad \phi(t) = \sum_{k=1}^{N_L} \sum_{s=0}^{R_k-1} t^s e^{-\lambda_k t} \left( \sum_{p=0}^{R_k-s-1} \sum_{m=s}^{R_k-p-1} \frac{1}{s!} a_{k,j,m} \psi_{k,j,m-s} \right) + \sum_{k=N_H}^{\infty} a_k \psi_k e^{-\lambda_k t}.$$

For any $k \in \{1, \ldots, N_L\}$, the coefficient corresponding to $t^{R_k-1}e^{-\lambda_k t}$ is

$$\sum_{j \in \mathcal{I}_k, \mathcal{I}_{k,0}} \frac{1}{(R_k-1)!} a_{k,j,R_k-1} \psi_{k,j,0},$$

the coefficient corresponding to $t^{R_k-2}e^{-\lambda_k t}$ is

$$\sum_{j \in \mathcal{I}_k, \mathcal{I}_{k,1}} \frac{1}{(R_k-2)!} a_{k,j,R_k-2} \psi_{k,j,0} + \sum_{j \in \mathcal{I}_k, \mathcal{I}_{k,0}} \frac{1}{(R_k-2)!} a_{k,j,R_k-1} \psi_{k,j,1},$$

and so on.

We shall use these expressions of the solution $\phi$ of $(1.10)$ in order to prove our observability inequality for this equation. Note that in $(3.9)$ appears the family of functions

$$(t^s e^{-\lambda_k t})_{1 \leq k \leq N_L, \quad 0 \leq s \leq R_k-1} \cup (e^{-\lambda_k t})_{k \geq N_H}.$$

Given $T > 0$, we need to construct and estimate a biorthogonal family in $L^2(0, T)$ to this family. In fact, we can obtain a slightly more general result and we start with the family

$$\Lambda = (t^s e^{-\lambda t})_{\lambda \in \Sigma, \quad 0 \leq s \leq \eta-1},$$

17
where $\eta \geq 1$ is a given integer. The following section is devoted to the construction and evaluation of a biorthogonal sequence to $\Lambda$ in $L^2(0,T)$. Let us remark that such a construction has been already done in similar contexts by [1]. However, since we need to estimate the dependence of the norm of the biorthogonal sequence with respect to small $T$, we shall adopt a different and more explicit approach which is closer to the one used by [12], even though in [12] the exponents $\lambda$ are purely real and $\eta = 1$.

4 The biorthogonal family

Let $\Sigma$ be defined by (3.3) and $\eta \in \mathbb{N}^*$. Before starting the construction of a biorthogonal sequence to the family $\Lambda = \{t^s e^{-\lambda t}\}_{\lambda \in \Sigma, 0 \leq s \leq \eta - 1}$, for reader’s convenience, let us enumerate some simple properties of the set $\Sigma$ which will be used in this section.

Lemma 4.1. The eigenvalues of the operator $(D(A^*), A^*)$ from $\Sigma$ verify the following properties:

P1) There exists $\gamma > 0$ such that

$$|\lambda - \lambda'| \geq \gamma \quad (\lambda, \lambda' \in \Sigma, \lambda \neq \lambda').$$

P2) There exists a constant $\delta \in (0, N_H)$ such that

$$|\lambda_n - n^2| \leq \delta \quad (n \geq N_H),$$

$$|\Re(\lambda_{N_H}) - \Re(\lambda_n)| \geq \delta \quad (1 \leq n \leq N_L).$$

P3) For each $1 \leq n \leq N_L$ we have that

$$|\lambda_n| < |\lambda_{N_H}|.$$ 

P4) The sequence $(\lambda_n)_{n \geq N_H}$ verifies the following properties

(a) $|\Re(\lambda_n) - n^2| \leq C$, $n \geq N_H$,

(b) $\Re(\lambda_{n+1}) - \Re(\lambda_n) \geq \delta$, $n \geq N_H$.

P5) We have that

$$\sum_{\lambda \in \Sigma^H} \frac{1}{|\lambda|} < \infty.$$

Proof. The existence of $\gamma > 0$ verifying (4.1) follows from the localization of the elements of $\Sigma^H$ given by Theorem 2.18 and the fact that $\Sigma^L$ has only a finite number of different eigenvalues. On the other hand, with $\delta > 0$ given by Theorem 2.13, both (4.2) and (4.3) are verified. Indeed, since $2\delta < N + 1 < N_H$, we deduce that

$$\text{dist}(\Gamma_{N_H}(\delta), \Gamma_n(\delta)) \geq \delta \quad (1 \leq n \leq N_L),$$

which gives (4.3). Property (4.4) follows from Theorem 3.1 and the last properties are direct consequences of Theorem 2.18. \qed

For each $\lambda \in \Sigma$, let us consider the function $\Phi_\lambda : \mathbb{C} \to \mathbb{C}$ defined by

$$\Phi_\lambda(z) = \prod_{\lambda' \in \Sigma \setminus \{\lambda\}} \left(1 - \frac{z}{\lambda - \lambda'}\right).$$

Some of the basic properties of $\Phi_\lambda$ are described in the following lemma.
Lemma 4.2. The function $\Phi_\lambda$ is an entire function of arbitrarily small exponential type. Moreover, there exist three positive constants $B_0, C_1$ and $C_2$, depending at most upon $\gamma, N_L, N_H$ and $\delta$, such that we have, uniformly with respect to $\lambda$,

\begin{equation}
|\Phi_\lambda(z)| \leq C_1 e^{\pi \sqrt{|z|}} (1 + |z|)^{B_0} \quad (z \in \mathbb{C}),
\end{equation}

\begin{equation}
|\Phi_\lambda(ix - \lambda)| \leq C_2 e^{\pi \sqrt{|x|}} (1 + |\Re(\lambda)| + |x|)^{B_0} \quad (x \in \mathbb{R}).
\end{equation}

**Proof.** Firstly, by using (4.1), we deduce that

\begin{equation}
|\Phi_\lambda(z)| \leq \prod_{\lambda' \in \Sigma \setminus \{\lambda\}} \left(1 + \frac{|z|}{|\lambda' - \lambda|}\right) \leq \prod_{\lambda' \in \Sigma \setminus \{\lambda\}} \left(1 + \frac{|z|}{\gamma}\right) \prod_{\lambda' \in \Sigma_H \setminus \{\lambda\}} \left(1 + \frac{|z|}{|\lambda' - \lambda|}\right)
\end{equation}

\begin{equation}
\leq \left(\max\left\{1, \frac{1}{\gamma}\right\}\right)^{N_L} (1 + |\lambda_H|)^{|\lambda|} (1 + |x|)^{N_L} \prod_{\lambda' \in \Sigma_H \setminus \{\lambda\}} \left(1 + \frac{|z|}{|\lambda'|}\right) \prod_{\lambda' \in \Sigma_H \setminus \{\lambda\}} \frac{|\lambda'|}{|\lambda' - \lambda|}.
\end{equation}

Now, by taking into account that $(\Re(\lambda))_{\lambda \in \Sigma_H}$ verifies the properties $P4$ from Lemma 4.1, estimate (4.7) follows as in [12, Lemma 4.1].

For the proof of (4.8), we remark that

\begin{equation}
|\Phi_\lambda(ix - \lambda)| = \prod_{\lambda' \in \Sigma \setminus \{\lambda\}} \left|\frac{\lambda' - ix}{\lambda' - \lambda}\right| \leq \prod_{\lambda' \in \Sigma \setminus \{\lambda\}} \left|\frac{\lambda' + ix}{\gamma}\right| \prod_{\lambda' \in \Sigma_H \setminus \{\lambda\}} \left|\frac{\lambda' + ix}{\lambda' - \lambda}\right|
\end{equation}

\begin{equation}
\leq \left(1 + \frac{1}{\gamma}\right)^{N_L} (\max\{1, |\lambda_H|\})^{N_L} (1 + |x|)^{N_L} \prod_{\lambda' \in \Sigma_H \setminus \{\lambda\}} \left(1 + \frac{|z|}{|\lambda'|}\right) \prod_{\lambda' \in \Sigma_H \setminus \{\lambda\}} \frac{|\lambda'|}{|\lambda' - \lambda|}.
\end{equation}

Let us evaluate each of the last two products in (4.9). For the first product we remark that

\begin{equation}
\ln \left[\prod_{\lambda' \in \Sigma_H} \left(1 + \frac{|x|}{|\lambda'|}\right)\right] \geq \sum_{k \geq N_H} \ln \left(1 + \frac{|x|}{k^2}\right) + \sum_{k \geq N_H} \ln \left(\frac{|\lambda_k| + |x|}{k^2}\right) + \sum_{k \geq N_H} \ln \left(\frac{k^2}{|\lambda_k|}\right).
\end{equation}

Now, from (4.2), we have that there exists a positive constant $C$ such that

\begin{equation}
S_3 \leq \sum_{k \geq N_H} \ln \left(\frac{|\lambda_k| + k^2 - \lambda_k}{|\lambda_k|}\right) \leq \sum_{k \geq N_H} \ln \left(1 + \frac{\delta}{|\lambda_k|}\right) \leq \sum_{k \geq N_H} \frac{\delta}{|\lambda_k|} \leq C,
\end{equation}

\begin{equation}
S_2 = \sum_{k \geq N_H} \ln \left(1 + \frac{|\lambda_k| - k^2}{k^2 + |x|}\right) \leq \sum_{k \geq N_H} \ln \left(1 + \frac{\delta}{k^2 + |x|}\right) \leq \sum_{k \geq N_H} \frac{\delta}{k^2} \leq C,
\end{equation}

\begin{equation}
S_1 \leq \sum_{k \geq 1} \ln \left(1 + \frac{|x|}{k^2}\right) = \ln \left[\prod_{k \geq 1} \left(1 - \frac{i \sqrt{|x|}}{k^2}\right)^2\right] = \ln \left[\frac{\sin \left(i \pi \sqrt{|x|}\right)}{i \pi \sqrt{|x|}}\right] \leq \ln \left[C e^{\pi \sqrt{|x|}}\right].
\end{equation}

The above inequalities for $(S_i)_{i \leq 3}$, together with (4.10), imply that there exists $C > 0$ such that

\begin{equation}
\prod_{\lambda' \in \Sigma_H} \left(1 + \frac{|x|}{|\lambda'|}\right) \leq C e^{\pi \sqrt{|x|}}.
\end{equation}

We pass now to evaluate the second product in (4.9). We have that

\begin{equation}
\prod_{\lambda' \in \Sigma_H \setminus \{\lambda\}} \frac{|\lambda' - \lambda|}{|\lambda'|} \geq \prod_{\lambda' \in \Sigma_H \setminus \{\lambda\}} \frac{|\Re(\lambda') - |\Re(\lambda)|}{|\Re(\lambda')|} \prod_{\lambda' \in \Sigma_H \setminus \{\lambda\}} \frac{|\Re(\lambda')|}{|\lambda'|}.
\end{equation}
We evaluate each of the products above. For the product $P_1$ we use property P4) and the same arguments as in [12, Lemma 4.1]. We deduce that there exist two positive constants $B_0 > 0$ and $C > 0$ such that

$$(P_1)^{-1} \leq C(1 + |\Re(\lambda)|)^{B_0}.$$  

For the second product, by using (4.2), we deduce that there exists $C > 0$ such that

$$(P_2)^2 = \prod_{\lambda' \in \Sigma^H \setminus \{\lambda\}} \frac{|\lambda'|^2 - (\Im(\lambda'))^2}{|\lambda|^2} \geq \prod_{\kappa \geq H} \left(1 - \frac{\delta^2}{(k^2 - \delta^2)}\right) \geq C.$$  

Hence, the last inequalities for $(P_1)_{1 \leq i \leq 2}$ imply that there exist $B_0, C > 0$ such that

$$(4.12) \quad \prod_{\lambda' \in \Sigma^H \setminus \{\lambda\}} \frac{|\lambda'|^2 - (\Im(\lambda'))^2}{|\lambda|^2} \leq C(1 + |\Re(\lambda)|)^{B_0}.$$  

From (4.9), (4.11) and (4.12) it follows that (4.8) holds and the proof of the lemma is complete.

\[\square\]

**Remark 4.3.** Estimate (4.7) implies that $\Phi_\lambda$ is a function of order not exceeding $\frac{1}{2}$ and a type not exceeding $\pi$ if or order $\frac{1}{2}$. We recall that an entire function of exponential type $\tau \in (0, \infty)$ is a function of order not exceeding 1 and a type not exceeding $\tau$ if of order 1 (see [3, Page 8]).

Let us define the $C^\infty(\mathbb{R})$ function

$$\sigma_\nu := \begin{cases} 
\exp\left(-\frac{\nu^2}{1 - \nu^2}\right) & \text{if } |t| < 1 \\
0 & \text{if } |t| \geq 1,
\end{cases}$$  

where $\nu$ is a positive constant and put $c_\nu = 1/\|\sigma_\nu\|_{L^1}$. Given $\beta > 0$, we introduce the function

$$(4.14) \quad H_\beta(z) = c_\nu \int_{-1}^1 \sigma_\nu(t)e^{-izt} dt.$$  

The properties of $H_\beta$ we are interested in are listed in the following lemma.

**Lemma 4.4.** Let $\beta > 0$, $\varphi > 0$ and set $\nu = (\pi + \varphi)/\beta$. The function $H_\beta$ defined by (4.14) is an entire function of exponential type $\beta$ which verifies the following properties:

$$(4.15) \quad H_\beta(0) = 1,$$

$$(4.16) \quad |H_\beta(z)| \leq \exp(\beta|y|) \quad (z = x + iy, \ x, y \in \mathbb{R}),$$

$$(4.17) \quad |H_\beta(x)| \leq C_3 \sqrt{\nu + 1} \exp\left(3\nu/4 - (\pi + \varphi/2)\sqrt{|x|}\right) \quad (x \in \mathbb{R}),$$

$$(4.18) \quad |H_\beta(iy)| \geq \frac{1}{\Pi \sqrt{\nu + 1}} \exp\left(\beta|y|/(2\sqrt{\nu + 1})\right) \quad (y \in \mathbb{R}),$$

$$(4.19) \quad |H_\beta(x + iy)| \geq \frac{C_4}{\sqrt{\nu + 1}} \exp\left(\beta|y|/(2\sqrt{\nu + 1})\right) \quad (y \in \mathbb{R}, \ |x| \leq \pi/4\beta).$$  

where $C_3$ and $C_4$ are two positive constants, independent of $\varphi$, $\nu$ and $\beta$.

**Proof.** From (4.14) we deduce that $H_\beta$, being the Fourier transform of a function in $L^2(-\beta, \beta)$, is an entire function of exponential type $\beta$. Properties (4.15)-(4.18) are proved in [12, Lemma 4.3] (see, also, [13, Lemma 9.2.3]). It remains to show estimate (4.19). We have that

$$|H_\beta(x + iy)| \geq c_\nu \left|\int_{-1}^1 \sigma_\nu(t)e^{\beta ty} \cos(\beta tx) dt\right|.$$
Since $0 \leq \beta |x| \leq \frac{\pi}{4}$, it follows that
\[
\frac{\sqrt{2}}{2} \leq \cos(\beta tx) \leq 1,
\]
from which we deduce that
\[
|H_\beta(x + iy)| \geq c_\nu \frac{\sqrt{2}}{2} \int_{-1}^{1} \sigma_\nu(t)e^{\beta ty} \, dt = \frac{\sqrt{2}}{2} H_\beta(iy).
\]
(4.20)

By using (4.20) and (4.18) we deduce immediately that (4.19) holds and the proof of the lemma is complete.

For each $\lambda \in \Sigma$, let us now define the entire function
\[
Q_\lambda(z) = \Phi_\lambda(iz \mp \bar{\lambda}) \frac{H_\beta(z)}{H_\beta(-i\lambda)}.
\]
(4.21)

The properties of the function $Q_\lambda$ we are interested in are given by the following lemma.

**Lemma 4.5.** For each $\lambda \in \Sigma$, the function $Q_\lambda$ defined by (4.21) has the following properties:

1. For each $\lambda' \in \Sigma$ we have that $Q_\lambda(-i\lambda') = \begin{cases} 1 & \text{if } \lambda = \lambda', \\ 0 & \text{if } \lambda \neq \lambda'. \end{cases}$
2. $Q_\lambda$ is an entire function of exponential type $\beta$.
3. There exists $\beta_0 > 0$ such that, for each $\beta \in (0, \beta_0]$, the following estimate holds
   \[
   |Q_\lambda(x)| \leq C_5 (1 + |\Re(\lambda)| + |x|)^{B_0} \exp \left( \frac{\kappa}{\beta} - \frac{\beta}{2} \sqrt{|x|/\beta - \beta |\Re(\lambda)|/(2\sqrt{\nu + 1})} \right) \quad (x \in \mathbb{R}),
   \]
   where the two positive constants $C_5$ and $\kappa$ are independent of $\beta \in (0, \beta_0]$.

**Proof.** From definitions (4.21) of the function $Q_\lambda$, (4.14) of the function $H_\beta$ and (4.6) of the function $\Phi_\lambda$ we deduce immediately that the first property of $Q_\lambda$ holds true. Moreover, by taking into account estimate (4.7) for $\Phi_\lambda$ and the fact that, according to Lemma 4.4, $H_\beta$ is an entire function of exponential type $\beta$, it follows that $Q_\lambda$ verifies the second property, too.

To prove (4.22), let us first recall that, according to (2.1), $|\Im(\lambda)| \leq D_0$ for each $\lambda \in \Sigma$. By taking $\beta_0 = \frac{\sqrt{\nu} + 1}{4D_0}$ we deduce from (4.19) that, for any $\beta \leq \beta_0$, the following estimate holds
\[
|H_\beta(-i\lambda)| \geq \frac{C_4}{\sqrt{\nu + 1}} \exp \left( \beta |\Re(\lambda)|/(2\sqrt{\nu + 1}) \right).
\]
(4.23)

From (4.8), (4.17) and (4.23) we obtain that, for any $x \in \mathbb{R}$, we have
\[
|Q_\lambda(x)| = \left| \Phi_\lambda(iz \mp \bar{\lambda}) \frac{H_\beta(x)}{H_\beta(-i\lambda)} \right| \leq \frac{C_2C_3}{C_4} (\nu + 1)(1 + |\Re(\lambda)| + |x|)^{B_0} \exp \left( 3\nu - \frac{\beta}{4} \sqrt{|x|/\beta - \beta |\Re(\lambda)|/(2\sqrt{\nu + 1})} \right).
\]
(4.24)

Since $\nu = \frac{(\pi + \phi)^2}{\beta}$, from (4.24) we deduce that the following estimate holds true for any $\beta \in (0, \beta_0]$
\[
|Q_\lambda(x)| \leq \frac{C_5}{\beta} (1 + |\Re(\lambda)| + |x|)^{B_0} \exp \left( \frac{3(\pi + \phi)^2}{4\beta} - \frac{\beta}{2} \sqrt{|x|/\beta - \beta |\Re(\lambda)|/(2\sqrt{\nu + 1})} \right) \quad (x \in \mathbb{R}),
\]
where $C_5$ is a positive constant independent of $\beta$. The last inequality gives (4.22) by taking $\kappa = \frac{3(\pi + \phi)^2}{4\beta} + 1$. \qed
Moreover, there exists a positive constant $C_0$ independent of $\lambda$ and $\beta \in (0, \beta_0)$, such that

$$|p_{\lambda,j}(z)| \leq \frac{C_0^6}{\beta^{n/2}} \frac{1}{|z + i\lambda|^{n-1}}. \quad (z \in \mathbb{C}).$$

**Proof.** We shall explicitly construct and evaluate the polynomials $p_{\lambda,j}$ for each $0 \leq j \leq \eta - 1$. First, we define

$$p_{\lambda,\eta-1}(z) = \frac{1}{(\eta - 1)!} (z + i\lambda)^{\eta-1}. \quad (\eta \geq 1, \lambda \in \mathbb{C}).$$

We remark that relations (4.25) are verified in the case $j = \eta - 1$ and we have that

$$|p_{\lambda,\eta-1}(x)| \leq \frac{1}{(\eta - 1)!} |z + i\lambda|^{\eta-1}. \quad (\eta \geq 1, \lambda \in \mathbb{C}).$$

Generally, for $0 \leq j \leq \eta - 1$, we define

$$p_{\lambda,j}(z) = \sum_{k=0}^{\eta-1} a_{\lambda,j,k} (z + i\lambda)^k,$$

where the values $(a_{\lambda,j,k})_{0 \leq k \leq \eta - 1}$ are given recursively as follows

$$\begin{align*}
  a_{\lambda,j,k} &= 0 \quad (0 \leq k < j) \\
  a_{\lambda,j,j} &= 1, \\
  a_{\lambda,j,k} &= -\sum_{s=1}^{k-j} C_s^k (Q_\lambda^\eta)^{(s)}(-i\lambda) a_{\lambda,j,k-s} \quad (j + 1 \leq k \leq \eta - 1).
\end{align*}$$

Notice that (4.29) implies that $a_{\lambda,j,k} = p_{\lambda,j}^{(k)}(-i\lambda)$. From (4.30) it follows immediately that $Q_\lambda^\eta p_{\lambda,j}$ verifies (4.25). In order to prove (4.26), we evaluate $(Q_\lambda^\eta)^{(s)}(-i\lambda)$ and show that there exists a constant $C > 0$ such that

$$|(Q_\lambda^\eta)^{(s)}(-i\lambda)| \leq \frac{C}{\beta^s e^{\beta |R(\lambda)|}} \quad (0 \leq s \leq \eta - 1).$$

Indeed, by using the Cauchy formula, we have that

$$\left|\frac{Q_\lambda^\eta(z)}{(z + i\lambda)^{s+1}}\right| = \left|\frac{1}{2\pi i} \oint_{R^\gamma} \frac{Q_\lambda^\eta(z)}{(z + i\lambda)^{s+1}} \frac{dz}{z - z_0}\right|,$$

where $R \in (0, \gamma)$, $R^\gamma = \{z \in \mathbb{C} : |z + i\lambda| = R\}$ and the contour integral is taken counter-clockwise.

Let us evaluate $Q_\lambda(z)$ on $R^\gamma$. From (4.21), (4.7), (4.16) and (4.19) it follows that for any $z \in R^\gamma$ of the form $z = -i\lambda + Re^{iu}$, $u \in [0, 2\pi]$, we have that

$$|Q_\lambda(z)| = \left|\frac{\Phi_\lambda(iRe^{iu})}{H_\beta(-i\lambda + Re^{iu})}\right| \leq \frac{C_1}{C_4} (1 + R)^{B_0} \sqrt{\nu + \frac{1}{\nu} e^{\nu + R\beta + |R|}}.$$
and (4.31) is proved.

Now, from (4.30) and (4.31), we immediately deduce that
\[
\left| p_{λ,j}^{(k)}(-iX) \right| \leq \frac{C}{β^2} e^{β|k-j||ℜ(λ)|} \quad (k \geq j),
\]
which, by taking into account (4.29), implies that
\[
(4.32) \quad \left| p_{λ,j}(z) \right| \leq \frac{C}{β^2} |z + i|^{η-1-j} \sum_{s=0}^{η-1} \frac{1}{(s+j)!} |z + i|^{s+1} e^{β|s| |ℜ(λ)|} \quad (z \in \mathbb{C}).
\]

Estimate (4.32) shows that (4.26) holds and the proof of the lemma is complete. \(\square\)

For each \(λ \in Σ\) and \(j \in \{0, 1, ..., η - 1\}\), let us define the function
\[
(4.33) \quad G_{λ,j}(z) = Q_{λ,j}^2(z) p_{λ,j}(z) \quad (z \in \mathbb{C}),
\]
where \(Q_λ\) is given by (4.21) and \(p_{λ,j}\) are the polynomials functions from Lemma 4.6. The following theorem studies the main properties of the function \(G_{λ,j}\).

**Theorem 4.7.** For each \(λ \in Σ\) and \(j \in \{0, 1, ..., η - 1\}\), the function \(G_{λ,j}\) defined by (4.33) has the following properties:

1. For each \(λ' \in Σ\) we have that
\[
(4.34) \quad (G_{λ,j})^{(k)}(-iX) = \begin{cases} 1 & \text{if } λ = λ' \text{ and } j = k \quad (1 \leq k \leq η - 1). \\ 0 & \text{otherwise.} \end{cases}
\]

2. \(G_{λ,j}\) is an entire function of exponential type \(ηβ\).

3. There exists \(β_0 > 0\) such that, for each \(β \in (0, β_0]\), the following estimate holds
\[
(4.35) \quad \|G_{λ,j}\|_{L^2(\mathbb{R})} \leq \frac{C_7}{|ℜ(λ)| + 1} \exp \left( \frac{κ}{β} + \frac{η^2 |ℜ(λ)|}{β} \right),
\]
where the two positive constants \(C_7\) and \(κ\) are independent of \(λ\), \(j\) and \(β \in (0, β_0]\).

**Proof.** Properties (4.34) are consequences of (4.25). Since the polynomials \(p_{λ,j}\) have degree less than \(η\) and \(Q_λ\) is an entire function of exponential type \(β\), it follows that \(G_{λ,j}\) is an entire function of exponential type \(ηβ\). Finally, estimate (4.35) is a consequence of estimates (4.22) and (4.26). Indeed from (4.22) and (4.26), we have that
\[
|G_{λ,j}(x)|^2 = |Q_{λ,j}^2(x) p_{λ,j}(x)|^2 \leq \frac{(5C_6 β^2)}{(β^2)^2} (1 + |ℜ(λ)| + |x|)^{2B_0} \exp \left( \frac{2κ}{β} - θ |ℜ(λ)| \sqrt{β} |ν + 1| \right) (1 + |x + iX|)^{2η} e^{2η |ℜ(λ)| |ν + 1|} \]
\[
\leq \frac{(5C_6 β^2)}{(β^2)^2} \exp \left( \frac{2κ}{β} + 2η |ℜ(λ)| \right) c'' (1 + |ℜ(λ)| + |x|)^{2B_0 + 2η} \exp \left( -θ |x| - β |ℜ(λ)| \sqrt{β} |ν + 1| \right).
\]

Now, we have that
\[
(1 + |ℜ(λ)| + |x|)^{2B_0 + 2η} \exp \left( -θ |x| - β |ℜ(λ)| \sqrt{β} |ν + 1| \right) \leq (1 + |ℜ(λ)|)^{2B_0 + 2η} \exp \left( -β |ℜ(λ)| \sqrt{β} |ν + 1| \right) (1 + |x|)^{2B_0 + 2η} \exp \left( -θ |x| \right) \]
\[
\leq C \left( \frac{β}{ν + 1} \right)^{2B_0 + 2η} \frac{1}{(1 + |ℜ(λ)|)^2} (1 + |x|)^{2B_0 + 2η} \exp \left( -θ |x| \right),
\]

and the proof follows.
where we have used in the last inequality that \((1 + s)^{2B_0 + 2\eta + 2}e^{-s} \leq C = C(\eta, B_0)\) for any \(s \geq 0\). The conclusion follows by taking into account that
\[
\int_\mathbb{R} (1 + |x|)^{2B_0 + 2\eta} \exp\left(-\frac{\sqrt{2}}{\sqrt{\beta}}|x|\right) \, dx \leq C(\eta, B_0, \theta)
\]
and, for any \(\kappa' > \kappa\),
\[
\frac{1}{\beta \eta^2} \exp\left(\frac{2\kappa}{\beta} + 2\eta^2 \beta |\Re(\lambda)|\right) \left(\sqrt{\nu} + 1\right)^{2B_0 + 2\eta} \leq C \exp\left(\frac{2\kappa'}{\beta} + 2\eta^2 \beta |\Re(\lambda)|\right).
\]

Now we have all the ingredients needed to construct our biorthogonal family. For each \(\lambda \in \Sigma\) and \(j \in \{0, 1, \ldots, \eta - 1\}\), we define the function \(\theta_{\lambda,j}\) as follows
\[
(4.36) \quad \theta_{\lambda,j}(t) = \frac{(-i)^j}{2\pi} \int_\mathbb{R} G_{\lambda,j}(x)e^{izt} \, dx.
\]
The following result is a consequence of the properties of the function \(G_{\lambda,j}\) proved in Theorem 4.7

**Theorem 4.8.** Let \(\Sigma\) be the family of eigenvalues given by (3.3) and let \(\eta \in \mathbb{N}^*\). There exists \(T_0 > 0\) such that, for any \(T \in (0, T_0)\), the family of functions \(\Lambda = \left(t^j e^{-\lambda t}\right)_{\lambda \in \Sigma, 0 \leq j \leq \eta - 1}\) has a biorthogonal \((\theta_{\lambda,j})_{\lambda \in \Sigma, 0 \leq j \leq \eta - 1}\) in \(L^2\left(-\frac{T}{2}, \frac{T}{2}\right)\) with the property that
\[
(4.37) \quad \|\theta_{\lambda,j}\|_{L^2\left(-\frac{T}{2}, \frac{T}{2}\right)} \leq \frac{c}{|\Re(\lambda)| + 1} \exp\left(\frac{2\eta^2 \kappa}{T} + \frac{T}{2} |\Re(\lambda)|\right),
\]
where the two positive constants \(c\) and \(\kappa\) are independent of \(\lambda, j\) and \(T\).

**Proof.** Let us chose \(T_0 = \min\{2\eta \beta_0, 1\}\), \(T \in (0, T_0)\) and \(\beta = \frac{T}{2\eta^2}\). The Paley-Wiener Theorem and Theorem 4.7 imply that (4.36) defines a function \(\theta_{\lambda,j}\) which belongs to \(L^2\left(-\frac{T}{2}, \frac{T}{2}\right)\). Moreover, since
\[
G_{\lambda,j}(z) = \frac{1}{(-i)^j} \int_{-\frac{T}{2}}^{\frac{T}{2}} \theta_{\lambda,j}(t)e^{-izt} \, dt \quad (z \in \mathbb{C}),
\]
relations (4.34) imply that \((\theta_{\lambda,j})_{\lambda \in \Sigma, 0 \leq j \leq \eta - 1}\) is a biorthogonal family to \(\Lambda\) in \(L^2\left(-\frac{T}{2}, \frac{T}{2}\right)\). Since the Plancherel formula implies that \(\sqrt{2\pi}\|\theta_{\lambda,j}\|_{L^2\left(-\frac{T}{2}, \frac{T}{2}\right)} = \|G_{\lambda,j}\|_{L^2(\mathbb{R})}\), from estimate (4.35) we deduce that (4.37) is verified with \(c = \frac{c_2}{\sqrt{\pi}}\) which completes the theorem’s proof.

The following result is a consequence of Theorem 4.8

**Corollary 4.9.** Under the hypothesis of Theorem 4.8 the following inequality holds true
\[
(4.38) \quad \sum_{\lambda \in \Sigma, 0 \leq j \leq \eta - 1} |a_{\lambda,j}|^2 e^{-2T \Re(\lambda)} \leq c \exp\left(\frac{4\eta^2 \kappa}{T}\right) \int_0^T \left| \sum_{\lambda \in \Sigma, 0 \leq j \leq \eta - 1} a_{\lambda,j} t^j e^{-\lambda t} \right|^2 \, dt
\]
for any finite sequence of complex numbers \((a_{\lambda,j})_{\lambda \in \Sigma, 0 \leq j \leq \eta - 1}\).

**Proof.** Let \((\theta_{\lambda,j})_{\lambda \in \Sigma, 0 \leq j \leq \eta - 1}\) be the biorthogonal to \(\Lambda\) in \(L^2\left(-\frac{T}{2}, \frac{T}{2}\right)\) given by Theorem 4.8. It follows that there exists a biorthogonal \((\bar{\theta}_{\lambda,j})_{\lambda \in \Sigma, 0 \leq j \leq \eta - 1}\) to \(\Lambda\) in \(L^2\left(0, T\right)\) such that
\[
(4.39) \quad \|\bar{\theta}_{\lambda,j}\|_{L^2\left(0, T\right)} \leq \frac{c}{|\Re(\lambda)| + 1} \exp\left(\frac{2\eta^2 \kappa}{T} + T|\Re(\lambda)|\right).
\]
Indeed, \( (\theta_{\lambda,j})_{\lambda \in \Sigma, 0 \leq j \leq \eta-1} \) is given by the following formulas

\[
(4.40) \quad \hat{\theta}_{\lambda,j} \left( t + \frac{T}{2} \right) = \left( \theta_{\lambda,j}(t) + \sum_{s=j+1}^{\eta-1} l_{j,s} \theta_{\lambda,s}(t) \right) e^{\frac{T}{2} \lambda} \quad \left( t \in \left( -\frac{T}{2}, \frac{T}{2} \right) \right),
\]

where the coefficients \( l_{j,s} \) can be obtained recursively

\[
(4.41) \quad \left\{ \begin{array}{l}
l_{j,j+1} = -C_j^{j+1} \left( \frac{T}{2} \right)^2, \\
l_{j,s} = -C_j^j \left( \frac{T}{2} \right)^2 - \sum_{r=1}^{s-1} C_r^j \left( \frac{T}{2} \right)^r l_{j,s-r}, \quad j + 2 \leq s \leq \eta - 1.
\end{array} \right.
\]

From (4.37), (4.40) and (4.41) it follows that (4.39) holds with a constant \( c \) depending only on \( T_0 \) and \( \eta \).

Let us now pass to prove (4.38). By using the orthogonality properties of \( (\theta_{\lambda,j})_{\lambda \in \Sigma, 0 \leq j \leq \eta-1} \) and Cauchy inequality we obtain that

\[
\sum_{\lambda \in \Sigma, 0 \leq j \leq \eta-1} |a_{\lambda,j}|^2 e^{-2T|\Re(\lambda)|} = \int_0^T \left( \sum_{\lambda \in \Sigma, 0 \leq j \leq \eta-1} a_{\lambda,j} e^{-2T|\Re(\lambda)|} \hat{\theta}_{\lambda,j}(t) \right) \left( \sum_{\lambda \in \Sigma, 0 \leq j \leq \eta-1} a_{\lambda,j} t e^{-\lambda t} \right) dt \leq \left( \int_0^T \left| \sum_{\lambda \in \Sigma, 0 \leq j \leq \eta-1} a_{\lambda,j} e^{-2T|\Re(\lambda)|} \hat{\theta}_{\lambda,j}(t) \right|^2 dt \right)^{1/2} \left( \int_0^T \left| \sum_{\lambda \in \Sigma, 0 \leq j \leq \eta-1} a_{\lambda,j} t e^{-\lambda t} \right|^2 dt \right)^{1/2} \leq \left( \sum_{\lambda \in \Sigma, 0 \leq j \leq \eta-1} |a_{\lambda,j}|^2 e^{-2T|\Re(\lambda)|} \right)^{1/2} \left( \sum_{\lambda \in \Sigma, 0 \leq j \leq \eta-1} e^{-2T|\Re(\lambda)|} \left\| \hat{\theta}_{\lambda,j} \right\|_{L^2(0,T)}^2 \right)^{1/2} \left( \int_0^T \left| \sum_{\lambda \in \Sigma, 0 \leq j \leq \eta-1} a_{\lambda,j} t e^{-\lambda t} \right|^2 dt \right)^{1/2}.
\]

By taking into account estimates (4.39) and since (4.5) implies that

\[
\sum_{\lambda \in \Sigma} \frac{1}{(|\Re(\lambda)| + 1)^2} < \infty,
\]

it follows that (4.38) holds and the proof ends. \( \square \)

\section{5 Observability result}

Now, we have all the ingredients needed to prove the observability inequality (1.13) for the solutions of the adjoint equation (1.10).

\textbf{Proof of Theorem 1.2.} Let \( T_0 \) be given by Theorem 4.8 and let \( T \in (0, T_0) \). We recall that the set \( \left\{ \psi_k \right\}_{1 \leq k \leq N_L} \cup \left\{ \psi_k \right\}_{k \geq N_H} \) is a Riesz basis in \( L^2(0, \pi) \) (see Theorem 3.1) and, if \( \varphi_0 \in L^2(0, \pi) \) is
given by (3.5) then the corresponding solution \( \varphi \) of (1.10) is given by (3.6). Consequently, we have that

\[
\|\varphi(T)\|_{L^2(0,\pi)}^2 \leq M_1 \left[ \sum_{k=N_L}^{\infty} |a_k|^2 e^{-2R(\lambda_k)T} + \sum_{k=1}^{N_L} \sum_{j=1}^{d_k} \left| a_{k,j,r_{k,j}} - 1 \right|^2 + \left| a_{k,j,r_{k,j} - 2} + \frac{T}{1!} a_{k,j,r_{k,j}} - 1 \right|^2 \right]
\]

(5.1)

\[
+ \ldots + \left| a_{k,j,0} + \frac{T}{1!} a_{k,j,1} + \frac{T^2}{2!} a_{k,j,2} + \ldots + \frac{T^{r_{k,j} - 1}}{(r_{k,j} - 1)!} a_{k,j,r_{k,j}} - 1 \right|^2 e^{-2R(\lambda_k)T} \right].
\]

Since \( T < T_0 \leq 1 \), from (5.1) we deduce that

\[
\|\varphi(T)\|_{L^2(0,\pi)}^2 \leq M_1 \left[ \sum_{k=1}^{N_L} \sum_{j=1}^{d_k} \sum_{m=0}^{r_{k,j} - 1} |a_{k,j,m}|^2 e^{-2R(\lambda_k)T} + \sum_{k=N_L}^{\infty} |a_k|^2 e^{-2R(\lambda_k)T} \right],
\]

(5.2)

where \( M_1 \) is a positive constant independent of \( T \). Let us now evaluate the right hand side of (1.13). To this aim, we use the solution \( \varphi(t) \) of (1.10) written in the form (3.9). From (4.38) we obtain that

\[
\int_0^T \int_\omega |\varphi(t,x)|^2 \, dx \, dt = \int_\omega \int_0^T |\varphi(t,x)|^2 \, dt \, dx \\
\geq ce^{-2\omega^2} \left( \sum_{k=1}^{N_L} \sum_{j=1}^{d_k} \sum_{m=0}^{r_{k,j} - 1} |S_{k,s}(x)|^2 \frac{R_{k,s}}{r_{k,j}} \sum_{s=0}^{\infty} \sum_{k=N_L}^{\infty} |a_k|^2 e^{-2R(\lambda_k)} \right) \left( \sum_{s=0}^{\infty} \sum_{k=N_L}^{\infty} |a_k|^2 e^{-2R(\lambda_k)} \right)
\]

(5.3)

where

\[
S_{k,s}(x) = \sum_{p=0}^{R_{k,s} - 1} \sum_{m=s}^{R_{k,s} - 1} \sum_{j \in \mathcal{I}_{k,p}} \frac{1}{s!} a_{k,j,m} \psi_{k,j,m-s}(x).
\]

(5.4)

For each \( 1 \leq k \leq N_L \), let \( S_k \) be the root space corresponding to the eigenvalues \( \lambda_k \) of dimension \( N_P(k) = \sum_{j=1}^{d_k} r_{k,j} \). For each \( 1 \leq k \leq N_L \), the following two properties hold true:

(P1) If \( S_{k,s} \equiv 0 \) for \( 0 \leq s \leq R_k - 1 \), then

\[
a_{k,j,m} = 0 \quad (1 \leq j \leq d_k, \ 0 \leq m \leq r_{k,j} - 1).
\]

(5.5)

(P2) For each \( 1 \leq k \leq N_L \), the map

\[
\mathbb{C}^{N_P(k)} \ni (a_{k,j,m})_{1 \leq j \leq d_k, \ 0 \leq m \leq r_{k,j} - 1} \mapsto \left( \sum_{s=0}^{R_{k,s} - 1} \int_\omega |S_{k,s}(x)|^2 \, dx \right)^{1/2} \in \mathbb{R}_+,
\]

(5.6)

is a norm in \( \mathbb{C}^{N_P(k)} \).

Property (P2) is a direct consequence of definition (5.4) and property (P1). To prove property (P1) we use the unique continuation principle given by Lemma 2.15. Notice that the properties of our kernel \( K \) allow us to apply this Lemma. Since

\[
S_{k,R_k - 1}(x) = \frac{1}{(R_k - 1)!} \sum_{j \in \mathcal{I}_{k,0}} a_{k,j,0} \psi_{k,j,0}(x),
\]

and \( \psi_{k,j,0} \in \ker(A^* - \lambda_k I) \), \( j \in \mathcal{I}_{k,0} \), from Lemma 2.15 we deduce that

\[
a_{k,j,R_k - 1} = 0 \quad (j \in \mathcal{I}_{k,0}).
\]

(5.7)
Since
\[ S_{k,R_k-2}(x) = \frac{1}{(R_k - 2)!} \left( \sum_{j \in I_{k,0}} a_{k,j,R_k-2} \psi_{k,j,0}(x) + \sum_{j \in I_{k,1}} a_{k,j,R_k-1} \psi_{k,j,1}(x) \right) + \sum_{j \in I_{k,2}} a_{k,j,R_k-2} \psi_{k,j,0}(x), \]
and \( \psi_{k,j,0} \in \ker(A^* - \lambda_k \mathcal{I}) \), \( j \in I_{k,0} \cup I_{k,1} \), from [5.7] and Lemma 2.15 we deduce that
\[ a_{k,j,R_k-2} = 0 \quad (j \in I_{k,0} \cup I_{k,1}). \]

If we suppose that, for some \( 0 \leq q \leq R_k - 1 \), we have that
\[ a_{k,j,l} = 0 \quad (j \in \cup_{s=0}^{R_k-2-q} I_{k,s}, \quad q + 1 \leq l \leq R_k - 1), \]
then it follows that
\[ S_{k,q}(x) = \frac{1}{q!} \sum_{p=0}^{R_k-q-1} \sum_{j \in I_{k,p}} a_{k,j,q} \psi_{k,j,0}(x). \]

Since \( \psi_{k,j,0} \in \ker(A^* - \lambda_k \mathcal{I}) \) for \( j \in \cup_{p=0}^{R_k-1-q} I_{k,p} \), by using again Lemma 2.15 we deduce that
\[ a_{k,j,q} = 0 \quad (j \in \cup_{p=0}^{R_k-1-q} I_{k,l}). \]
Hence, we have proved by induction that (P1) holds true.

From (P2) we deduce that, for each \( 1 \leq k \leq N_L \), there exists a constant \( c_k > 0 \) such that,
\[ \sum_{s=0}^{R_k-1} \int_{\omega} |S_{k,s}(x)|^2 \, dx \geq c_k \sum_{j=1}^{d_k} \sum_{m=0}^{r_{kj}-1} |a_{k,j,m}|^2. \]

From (5.11), by taking \( c' = \min_{1 \leq k \leq N_L} c_k \), we deduce that
\[ \sum_{k=1}^{N_L} e^{-2T \Re(\lambda_k)} \sum_{s=0}^{R_k-1} \int_{\omega} |S_{k,s}(x)|^2 \, dx \geq c' \sum_{k=1}^{N_L} \sum_{j=1}^{d_k} \sum_{m=0}^{r_{kj}-1} |a_{k,j,m}|^2 e^{-2T \Re(\lambda_k)}. \]

Using (2.47), we have that
\[ \sum_{k=N_H}^{\infty} |a_k|^2 e^{-2T \Re(\lambda_k)} \int_{\omega} |\psi_k(x)|^2 \, dx \geq c'' \sum_{k=N_H}^{\infty} |a_k|^2 e^{-2T \Re(\lambda_k)}. \]

From (5.3), (5.12) and (5.13) it follows that
\[ \int_0^T \int_{\omega} |\varphi(t,x)|^2 \, dx \, dt \]
\[ \geq M_2 e^{-\frac{\zeta^2}{4}} \left( \sum_{k=1}^{N_L} \sum_{j=1}^{d_k} \sum_{m=0}^{r_{kj}-1} |a_{k,j,m}|^2 e^{-2T \Re(\lambda_k)} + \sum_{k=N_H}^{\infty} |a_k|^2 e^{-2T \Re(\lambda_k)} \right), \]
where \( M_2 = c \min\{c', c''\} \) is a positive constant independent of \( T \). By taking into account (5.2) and (5.14), we deduce that (1.13) holds with \( M_0 = \frac{M_2}{M_2} \) and \( \zeta = 4\eta^2 \kappa \) which concludes the proof of the theorem. \( \square \)
6 The nonlinear problem

The aim of this section is to provide the proof of Theorem \[1.3\]. Without loss of generality, we may suppose that \(T < T_0\), where \(T_0\) is given in Theorem \[1.2\]. Let us consider that

\[K(\xi, x) = \partial_{xx} w^S(\xi) e^{W(t)} \partial_{xx} w^S(x) e^{-W(x)},\]

with \(W(x) = \frac{1}{2} \int_0^x w^s \, ds\). Since \(\partial_{xx} w^S \neq 0\) in \(\omega\), the hypotheses Theorem \[1.2\] are satisfied and \[1.13\] holds true.

Let \(X = L^2(0, \pi)\) and \(U = L^2(\omega)\) and let us denote

\[\gamma : (0, \infty) \to [0, \infty), \quad t \mapsto \gamma(t) := M_0 \exp \left(\frac{\varsigma}{T}\right),\]

where \(M_0\) and \(\varsigma\) are the constants in \[1.13\].

As stated in Theorem \[1.1\] for any \(z_0 \in X\), there exists \(v \in L^2(0, T; U)\) such that the solution of \[1.8\] satisfies

\[z(T) = 0\]

and

\[\|v\|_{L^2(0,T;U)} \leq \gamma(T) \|z_0\|_X.\]

By using this result, one can handle the controllability of a system similar to \[1.8\] but with right-hand side (see \[10\]). We introduce here some notation in order to state such a result.

Let \(r \in (1, 2)\) be a constant. We consider \(\varsigma_0, \varsigma_1, \varsigma_*\) such that

\[(6.1) \quad \varsigma_1 \left(\frac{1}{r^2} - \frac{1}{4}\right) > \frac{\varsigma}{r - 1}, \quad \varsigma_0 = \frac{\varsigma_1}{r^2} - \frac{\varsigma}{r - 1}, \quad \varsigma_0 > \varsigma_* > \frac{\varsigma_1}{4} > 0.\]

We define three functions in \((0, T)\) by

\[(6.2) \quad \rho_\mathcal{F}(t) = \exp \left(-\frac{\varsigma_1}{T-t}\right), \quad \rho_0(t) = M_0 \exp \left(-\frac{\varsigma_0}{T-t}\right), \quad \rho(t) = \exp \left(-\frac{\varsigma_*}{T-t}\right),\]

so that \(\rho_\mathcal{F}, \rho_0\) and \(\rho\) are continuous, decreasing and \(\rho_\mathcal{F}(T) = \rho_0(T) = \rho(T) = 0\). We associate to the functions \(\rho_\mathcal{F}\) and \(\rho_0\) the Hilbert spaces \(\mathcal{F}\) and \(\mathcal{U}\) defined by

\[(6.3) \quad \mathcal{F} = \left\{ f \in L^2(0, T; X) \mid \frac{f}{\rho_\mathcal{F}} \in L^2(0, T; X) \right\},\]

\[(6.4) \quad \mathcal{U} = \left\{ u \in L^2(0, T; U) \mid \frac{u}{\rho_0} \in L^2(0, T; U) \right\}.\]

By supposing that \(z_0 \in D((-A)^{1/2})\) and \(f \in \mathcal{F}\), we are now able to obtain a controllability result for the nonhomogeneous equation

\[(6.5) \begin{cases}
\partial_t z(t) + A z(t) = f + v \chi_\omega, \\
 z(0) = z_0.
\end{cases}\]

In order to do this we use the controllability of \[1.8\] from Theorem \[1.2\] and the fact that \(\rho_\mathcal{F}, \rho_0\) and \(\rho\) satisfy the following relations

\[\rho_0(t) = \rho_\mathcal{F}(r^2(t - T) + T) \gamma((r - 1)(T - t)) \quad \left(t \in \left[T \left(1 - \frac{1}{r} \right)^2, T\right]\right),\]

\[\frac{\rho_0}{\rho}, \frac{\rho_\mathcal{F}}{\rho}, \frac{\rho' \rho_0}{\rho^2} \in L^\infty(0, T).\]
Consequently, applying Proposition 2.3 and Proposition 2.8 of [10], we deduce that for every $z_0 \in D((-A)^{1/2})$ and for every $f \in \mathcal{F}$, there exists $v \in \mathcal{U}$ such that the solution $z$ of (6.5) satisfies

$$z \in L^2(0, T; D(A)) \cap H^1(0, T; X) \cap C([0, T]; D((-A)^{1/2})).$$

Moreover, there exists a positive constant $C$ such that

$$\|z\|_{L^2(0, T; D(A)) \cap H^1(0, T; X) \cap C([0, T]; D((-A)^{1/2}))} \leq C \left( \|z_0\|_{D((-A)^{1/2})} + \|f\|_F \right).$$

Using the change of variables (1.5) and definition (1.7) of $A$, we deduce that for every $y_0 \in H^1_0(0, \pi)$, and for every $f \in \mathcal{F}$, there exists $u \in \mathcal{U}$ such that the solution $y$ of

$$\begin{align*}
\frac{\partial}{\partial t} y - \nu^S \partial_{xx} y - \mu \left( \int_0^\pi (\partial_x w^S)(\partial_x y) \, dx \right) \partial_{xx} w^S + w^S \partial_x y + y \partial_x w^S &= f + u \chi_w, \\
y(t, 0) &= y(t, \pi) = 0, \\
y(0, \cdot) &= y_0,
\end{align*}$$

satisfies

$$\frac{y}{\rho} \in L^2(0, T; H^2(0, \pi)) \cap H^1(0, T; L^2(0, \pi)) \cap C([0, T]; H^1_0(0, \pi)),$$

with the estimate

$$\left\| \frac{y}{\rho} \right\|_{L^2(0, T; H^2(0, \pi)) \cap H^1(0, T; L^2(0, \pi)) \cap C([0, T]; H^1_0(0, \pi))} \leq C \left( \|y_0\|_{H^1_0(0, \pi)} + \|f\|_F \right).$$

Notice that (6.8) implies, in particular, that

$$y(T) = 0.$$

In order to prove Theorem 1.3 we only need to show that the mapping

$$\mathcal{N} : f \in \mathcal{F} \mapsto F(y) \in \mathcal{F},$$

where $F$ is given by (1.3), is well-defined and admits a fixed point.

In order to do this, we first notice that (6.4) and (6.2) yield

$$\frac{\rho^4}{\rho_F} \leq C.$$ 

Using this inequality, relation (6.8) and standard properties of Sobolev spaces we find that

$$\|F(y)\|_F \leq C \left( \|y_0\|_{H^1_0(0, \pi)} + \|f\|_F \right) \left( 1 + \left( \|y_0\|_{H^1_0(0, \pi)} + \|f\|_F \right) \right).$$

Let us consider $f^1$ and $f^2$ in $\mathcal{F}$. Assume that $y^1$ and $y^2$ are the solutions of (6.7) associated with $f^1$ and $f^2$, respectively, with the initial condition $y_0$ and satisfying (6.8). Then some calculation and (6.10) imply

$$\|F(y^1) - F(y^2)\|_F \leq C \|f^1 - f^2\|_F \left( \|y_0\|_{H^1_0(0, \pi)} + \|f^1\|_F + \|f^2\|_F \right)^3.$$

Estimates (6.11) and (6.12) imply that we can use the Banach fixed point theorem on a ball of $\mathcal{F}$ of radius $\|y_0\|_{H^1_0(0, \pi)}$. If $\|y_0\|_{H^1_0(0, \pi)}$ is small enough, then the above estimates yield that $F$ is a contraction and this completes the proof of the theorem.
