HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Context and Objective

Breast cancer is the first cause of cancer death in women worldwide and a major concern to public health. Targeting p53–MDM2 interaction by using appropriate molecules offers an attractive strategy for p53 activation and a promising approach for new anticancer therapies. In this context, we provide an account of the evaluation of small molecules containing oxygen and nitrogen spiro-*bisheterocycles* in terms of effects on *in vitro* proliferation and apoptosis of human breast cancer cell lines (MCF-7 and MDA-MB231). The wider aim is to identify novel low-molecular-weight, easily-accessible synthetic spiro compounds for cancer chemotherapy.

Experimental Procedures

- Spiro-*bisheterocyclic* compounds 2-7 were chemically synthesized.
- Cell proliferation was assessed by resazurin assay.
- Annexin V-FITC/ PI apoptosis assays was performed in order to demonstrate apoptotic effects of spiro-*bisheterocyclic* In breast cancer cell lines.
- Quantitative reverse transcription-polymerase chain reaction (qRT-PCR) was used to analyze the wild-type *p53*, *MDM2*, *BAX* and caspase 3 gene expression levels.

Results

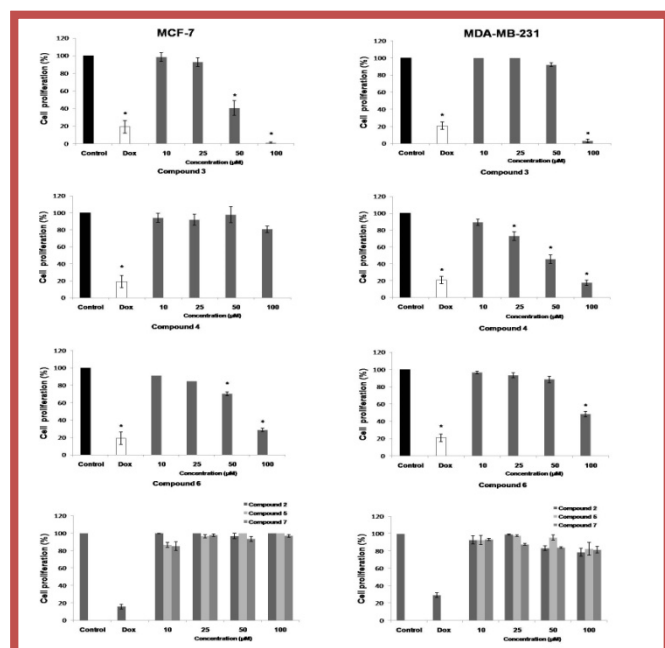

Figure 1. Effect of compounds 2-7 on the *in vitro* growth and proliferation of human breast cancer cells. MCF-7 and MDA-MB231 cell line were treated with 10, 25, 50 and 100 μ M of compounds 2-7 for 72 h.

The treatment with compounds 3 and 6, corresponding to spiro [hydantoin-isoxazole] and spiro [hydantoin-oxazepine] respectively, resulted in a significant decrease of cell proliferation and the induction of the apoptosis in both breast cancer cell lines whereas spiro [hydantoin-diazepine] was only active against MDA-MB 231 (Figure 1).

Figure 2. Drug-induced apoptosis in breast cancer cell lines MCF-7 and MDA-MB-231. Bright-field (top row), and fluorescent images of annexin V-fluorescein isothiocyanate (FITC) (middle row) and propidium iodide (PI) (bottom row) staining.

The images show significant induction of apoptosis with compounds 3 and 6 in MCF-7 cells, while strong apoptosis was observed with compounds 3, 4 and 6 in MDA-MB-231 cells (Figure 2).

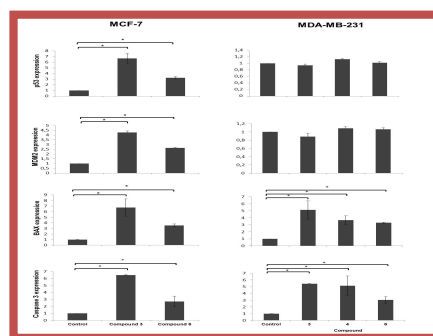

Figure 3; Results of qRT-PCR detection of p53, MDM2, BAX and caspase-3 gene expression in MCF-7 and MDA-MB-231 cells, following treatment with 100 μ M of compounds 3, 4 and 6 for 72 h.

The qRT-PCR revealed an up-regulation of MDM2, strictly p53-dependent, and an increase of the expression of pro-apoptotic genes such as caspase 3 and BAX in MCF-7 wild-type p53 and MDA-MB-231 mutant p53 breast cancer cells (Figure 3).

Conclusion

In summary, this study brings the first demonstration that new small spiro-*bisheterocyclic* molecules can sensitize breast cancer cells to apoptosis by targeting p53–MDM2 interaction. We also highlighted that these spiro compounds promote apoptosis *via* p53-independent pathway(s), suggesting that these compounds represent interesting candidates as therapeutic targets for the treatment of breast cancer.
