University of Lorraine
Argument Mining

- **Aim**: identify argument structures that can be found within the discourse
  - Argumentative schemes
  - Relationships between pairs of arguments
- **Introducing automation ~ 2000**
- **Applications**:
  - Stock market
  - Computerized essay grading
  - Computer-supported peer review
Projects

Argument mining

• Argument mining provides algorithms for automatically extracting argument structures from monological text and from transcripts of dialogue

• The Centre for Argument Technology has won £700k from EPSRC for a project on Argument Mining

• The group ran and hosted the Scottish Workshop on Argument Mining 2014

• Members of the group have founded a series of workshops dedicated to Argument Mining, with editions at ACL in 2014, NAACL in 2015, and chaired by us in 2016 at ACL.

• Members of the group also co-delivered tutorials on Argument Mining at IJCAI 2016 and ACL 2016.

Argument visualisation and analysis

• AnalysisWall – A very large touch screen supporting collaborative analysis in real time.

• OVA: Online Visualisation of Argument – A browser-based tool that supports analysis of online textual arguments and saves to the Argument Web. There are also two other tools in the suite: OVAview, which renders AIF argument resources diagrammatically and OVAgen for manipulating abstract frameworks. OVA+ supports analyses of dialogical arguments.

• Araucaria – A software tool for analysing arguments (also in a Polish version, Araucaria-PL) now largely replaced by OVA.

Argument in dialogue

• The Dialogue Game Description Language, DGDL+, a language for describing the rules of dialogue games

• The Dialogue Game Execution Platform providing generalised execution services for arbitrary dialogue games
How to automatically mine intertextual correspondences between U.S. candidates argumentation during primaries debates and Reddit users’ comments on those?
Some theory

Some politics

A spoonful of reality

Politics, people and argumentation

What now?
SOME THEORY
Example (A simple dialogue)

Alice: Q.
Bob: Why Q?
Alice: P.

Modelisation (A simple dialogue)

\[
\frac{P}{Q} \quad (P \Rightarrow Q)
\]
Inference Anchoring Theory

- Aim: link dialogical and argumentative structures
- Combination of logic and argumentation theories
- Reference: Budzynska and Reed, 2011
- Contribution to the Argument Web
  - Mediation project
  - Ethos mining
A CONCRETE EXAMPLE

Example (Reddit comments)

Redditor1: Every American should be a capitalist.
Redditor2: Why?
Redditor1: Our country was built on capitalism.
Every American should be a capitalist → Asserting → Redditor 1: Every American should be a capitalist
IAT DIAGRAM (LOADING...)

Redditor 1: Every American should be a capitalist

Asserting

Every American should be a capitalist

Redditor 2: Why?

Asserting

America was built on capitalism

Redditor 1: Our country was built on capitalism
Every American should be a capitalist

Asserting

Challenging

Default Transition

Redditor 2: Why?

Default Transition

Default Inference

America was built on capitalism

Arguing

Asserting

Redditor 1: Our country was built on capitalism
SOME POLITICS
U.S. presidential debates

- The American Presidency Project
- Web archive: American presidency related documents
- Transcripts of all presidential debates from 1960 to 2016
- 2016 elections:
  - 9 Democratic debates
  - 12 Republican debates
  - 3 General debates
ABOUT THE CORPORA

Reddit

- Social media and news aggregation, web content rating and discussion English-speaking website
- **subreddits**: news, science, politics, gaming, movies, ...
- In /r/politics, October 13 DNC Primary Debate - During-debate Discussion Discussion Megathread
1. For each debate, select the corresponding thread.
2. Sort the comments by time-stamp (oldest on top).
3. Remove all comments having no children.
4. Remove all comments trees beginning with irony or wordplay (rhetoric structures are not handled by IAT).
5. Keep comments trees classified by excerpts (time-stamp identification), discard all others.
A SPOONFUL OF REALITY
everybody in on the question of electability. Governor Chafee, you've been everything but invisible. When you were Senator from Rhode Island, you were a Republican. When you were elected governor, you were an independent. You've only been a Democrat for little more than two years. Why should Democratic voters trust you won't change again?

CHAFE: Anderson, you're looking at a block of granite when it comes to the issues. Whether it's AIPAC or any of the labels...

COOPER: It seems like pretty soft granite, I mean, you've been a Republican, you've been an Independent...

CHAFE: And I don't hear what I said. On the issues, I have not changed on the issues. I was a liberal Republican. Then I was an independent, and now I'm a proud Democrat. But I have not changed on the issues. And I open my record to scrutiny. Whether it's on the environment, woman's right to choose, gay marriage, fiscal responsibility, aversion to foreign entanglements, using the tools of government to help the less fortunate. Time and time again, I have never changed. You're looking at a block of granite when it comes to the issues. So I have not changed.

COOPER: Then why change labels?

CHAFE: The party left me. There was no doubt about that. There was no room for a liberal moderate like me in the Republican Party. I even had a primary for my recollection in 2006. I won the money poured in to defeat me in Rhode Island as a Republican. That's what we were up against.

INTERTEXTUAL CORRESPONDENCE MINING
STATING THE INTERTEXTUAL CORRESPONDENCE TASK

Input
\( R = \{r_1, \ldots, r_i, \ldots, r_n\} \) set of Reddit comments segments.
\( D = \{d_1, \ldots, d_j, \ldots, d_m\} \) set of presidential debates segments.

Output
\( C = (c_{i,j}) \), matrix of the correspondence coefficients between \( r_i \) and \( d_j \).
Natural Language Processing tools:

- Speakers similarity
- Frequent wordsets similarity
- Semantic similarity

\[ c_{i,j} = w_1 \cdot \text{Sp}(r_i, d_j) + \frac{w_2}{\text{length}(r_i)} \cdot \sum_{u \in r_i} \text{tf-idf}(u, d_j, D) + \frac{w_3}{\text{length}(r_i) \cdot \text{length}(d_j)} \cdot \sum_{u \in r_i, v \in d_j} \text{Semsim}(u, v) \]
Natural Language Processing tools:

- **Speakers similarity**
- **Frequent wordsets similarity**
- **Semantic similarity**

\[
c_{i,j} = w_1 \cdot Sp(r_i, d_j) + \frac{w_2}{\text{length}(r_i)} \cdot \sum_{u \in r_i} \text{tf-idf}(u, d_j, D) + \frac{w_3}{\text{length}(r_i) \cdot \text{length}(d_j)} \cdot \sum_{u \in r_i, v \in d_j} \text{Semsim}(u, v)
\]
Example

$r_i = \text{“Hillary Clinton knows Bernie Sanders’ gun control record isn’t his strong suit”}$

$d_j = \text{“CLINTON thinks what Senator SANDERS is saying certainly makes sense in the terms of the inequality that we have”}$

$S(t) = \{\text{CLINTON, SANDERS}\}$
SKETCHING THE ALGORITHM

Natural Language Processing tools:

- Speakers similarity
- Frequent wordsets similarity
- Semantic similarity

\[
c_{i,j} = w_1 \cdot \text{Sp}(r_i, d_j) + \frac{w_2}{\text{length}(r_i)} \cdot \sum_{u \in r_i} \text{tf-idf}(u, d_j, D) + \frac{w_3}{\text{length}(r_i) \cdot \text{length}(d_j)} \cdot \sum_{u \in r_i, v \in d_j} \text{Semsim}(u, v)
\]
Definition (Term frequency)

Let $w$ be a word of a (non-empty) segment $t$ in a corpus $C$. Term frequency of $w$ in $t$ is defined as

$$Tf(w, t) = \frac{|\{v \in t, v = w\}|}{|\{v \in t\}|}.$$

Definition (Inverse document frequency)

Inverse document frequency of $w$ in $C$ is defined as

$$Idf(w, C) = \begin{cases} 0 & \text{if } w \notin t, \\ \log \frac{|s, s \in C|}{|s \in C, w \in s|} & \text{otherwise}. \end{cases}$$
Definition (Term frequency–inverse document frequency)

Let $w$ be a word of a segment $t$ in a corpus $C$. 

$\text{tf-idf of } w \text{ in } t \text{ in } C$ is defined as

$$\text{tf-idf}(w, t, C) = \text{Tf}(w, t) \cdot \text{Idf}(w, C).$$
Natural Language Processing tools:

- Speakers similarity
- Frequent wordsets similarity
- Semantic similarity

\[
c_{i,j} = w_1 \cdot Sp(r_i, d_j) + \frac{w_2}{\text{length}(r_i)} \cdot \sum_{u \in r_i} \text{tf-idf}(u, d_j, D) + \frac{w_3}{\text{length}(r_i) \cdot \text{length}(d_j)} \cdot \sum_{u \in r_i, v \in d_j} \text{Semsim}(u, v)
\]
Definition

Semantic similarity of $w_1$ and $w_2$ is defined as

$$\text{Semsim}(w_1, w_2) = 1 - \frac{\min_{i,j} \{\text{length(path}(w_1 \#i, w_2 \#j))\}}{\max_{v,k} \{\text{length(path(entity, v\#k))}\}}.$$
SKETCHING THE ALGORITHM

Natural Language Processing tools:

- Speakers similarity
- Frequent wordsets similarity
- Semantic similarity

\[ c_{i,j} = w_1 \cdot Sp(r_i, d_j) + \frac{w_2}{\text{length}(r_i)} \cdot \sum_{u \in r_i} \text{tf-idf}(u, d_j, D) + \frac{w_3}{\text{length}(r_i) \cdot \text{length}(d_j)} \cdot \sum_{u \in r_i, v \in d_j} \text{Semsim}(u, v) \]
WHAT NOW?
CONCLUSION AND PERSPECTIVES

- Stating the **intertextual correspondence task**
- Developing the **corpora**
- Sketching the **intertextual correspondence algorithm**

- Future work
  - Other corpora?
  - Other methods?
THANK YOU FOR YOUR ATTENTION
