## Introduction

- Clathrate hydrates are ice-like crystalline compounds consisting of cage-like structures formed by hydrogen-bonded water molecules that enclose guest molecules stabilizing the lattice structure.

E. Dendy Sloan, Jr. 2003.

## Hydrate - based desalination process

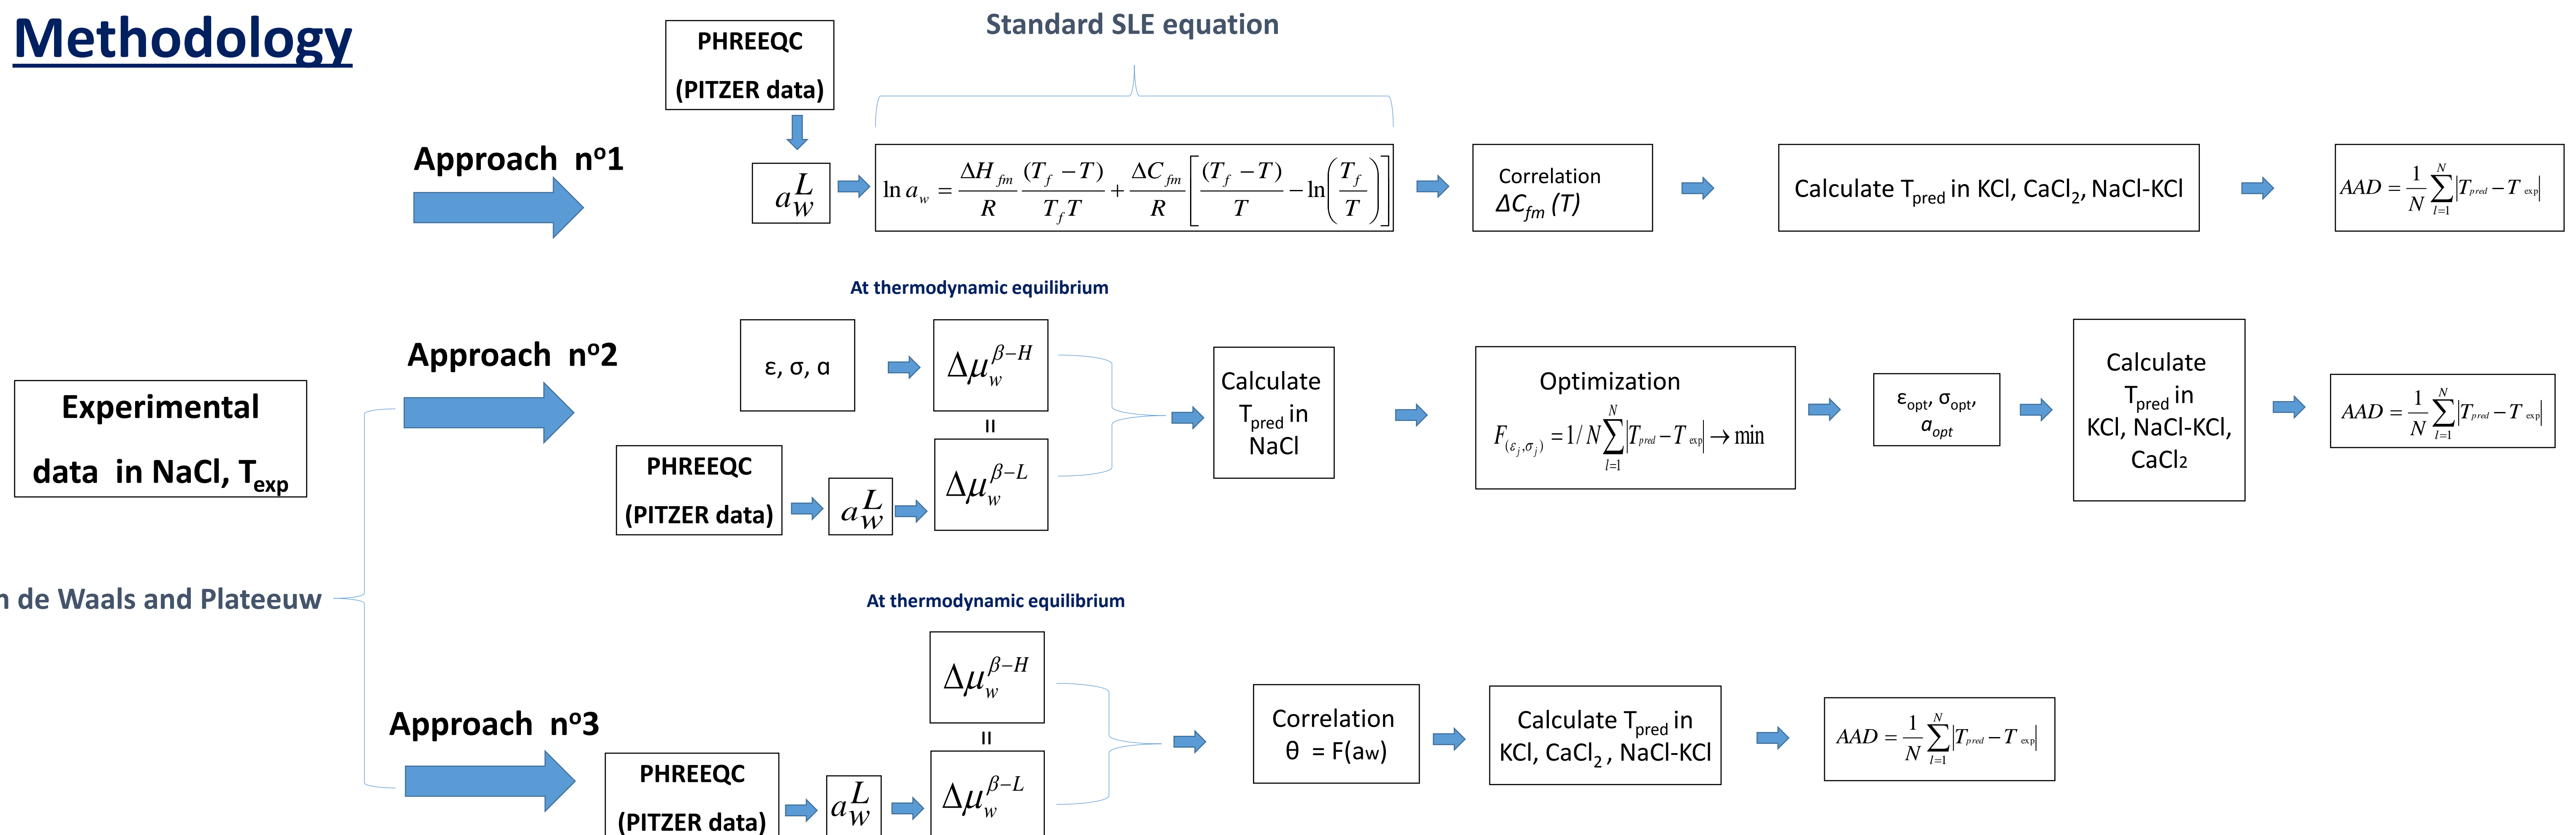

## Objective

Model the equilibria of cyclopentane hydrates in the presence of salts (NaCl, KCl, NaCl-KCl, CaCl<sub>2</sub>).

More hydrate phase equilibrium data in presence of salts are needed

## Methodology

## Modelling results

### Approach n°1

### Approach n°3

### Approach n°2

Summary : AAD (°C or K) of three approaches

	NaCl	KCl	NaCl-KCl	CaCl <sub>2</sub>
Approach n°1	0.3	0.3	0.2	0.4
Approach n°2	0.2	0.1	0.1	0.2
Approach n°3	0.1	0.1	0.1	0.2

## Conclusion

1. All approaches are capable of predicting the equilibrium temperatures of cyclopentane hydrates in brine with the average deviation less than, or equal to 0.4 K in all cases.
2. The new correlation between occupancy factor and water activity (approach n°3) is probably the best to obtain quick, consistent, and accurate dissociation temperature of cyclopentane hydrates in brine
