A BORG-LEVINSON THEOREM FOR MAGNETIC SCHRÖDINGER OPERATORS ON A RIEMANNIAN MANIFOLD

MOURAD BELLAOUED, MOURAD CHOULLI, DAVID DOS SANTOS FERREIRA, YAVAR KIAN, AND PLAMEN STEFANOV

Abstract. This article is concerned with uniqueness and stability issues for the inverse spectral problem of recovering the magnetic field and the electric potential in a Riemannian manifold from some asymptotic knowledge of the boundary spectral data of the corresponding Schrödinger operator under Dirichlet boundary conditions. The spectral data consist of some asymptotic knowledge of a subset of eigenvalues and Neumann traces of the associated eigenfunctions of the magnetic Laplacian. We also address the same question for Schrödinger operators under Neumann boundary conditions, in which case we measure the Dirichlet traces of eigenfunctions. In our results we characterize the uniqueness of the magnetic field from a rate of growth of the eigenvalues, combined with suitable asymptotic properties of boundary observation of eigenfunctions, of the associated magnetic Schrödinger operator. To our best knowledge this is the first result proving uniqueness from such general asymptotic behavior of boundary spectral data.

1. Introduction and main results

1.1. Statement of the problem. Let \( M = (M, g) \) be a smooth and compact Riemannian manifold with boundary \( \partial M \). We denote the Laplace-Beltrami operator associated to the Riemannian metric \( g \) by \( \Delta \). In local coordinates, the metric reads \( g = (g_{jk}) \), and the Laplace-Beltrami operator \( \Delta \) is given by

\[
\Delta = \frac{1}{|g|} \sum_{j,k=1}^{n} \frac{\partial}{\partial x_j} \left( \sqrt{|g|} g^{jk} \frac{\partial}{\partial x_k} \right).
\]

Here \( (g^{jk}) \) is the inverse of the metric \( g \) and \( |g| = \det(g_{jk}) \).

Given a couple of magnetic and electric potentials \( B = (A, q) \), where \( q \in L^\infty(M) \) is real-valued, and \( A = a_j dx^j \) is a covector field (1-form) with real-valued coefficients, \( a_j \in W^{1,\infty}(M) \), we consider the magnetic Laplacian

\[
\mathcal{H}_B = \frac{1}{|g|} \sum_{j,k=1}^{n} \left( \frac{1}{i} \frac{\partial}{\partial x_j} + a_j \right) \sqrt{|g|} g^{jk} \left( \frac{1}{i} \frac{\partial}{\partial x_k} + a_k \right) + q
\]

\[
= -\Delta - 2i A \cdot \nabla - i \delta A + |A|^2 + q
\]

DDSF is partly supported by ANR grant iproblems.

PS partly supported by NSF Grant DMS-1600327.
Here, the dot product is in the metric with \( A \) and \( \nabla \) considered as covectors, \( \delta \) is the coderivative (codifferential) operator, corresponding to the divergence with identifying vectors and covectors, which sends 1-forms to a functions by the formula
\[
\delta A = \frac{1}{\sqrt{|g|}} \sum_{j,k=1}^{n} \partial^j \left( g^{jk} \sqrt{|g|} a_k \right),
\]
and we recall that, for \( A = a_j dx^j \), we have \( |A|^2 = g^{jk} a_j a_k \).

For \( B = (A,q) \) with \( q \in L^2(\mathbb{R}^3) \) and \( A = a_j dx^j, a_j \in W^{1,\infty}(\mathbb{R}^3) \), define on \( L^2(\mathbb{R}^3) \) the unbounded self-adjoint operator \( H_B \) as follows
\[
H_B u = \mathcal{H}_B u
\]
and
\[
\mathcal{D}(H_B) = \{ u \in H^1_0(\mathbb{R}^3), -\Delta u + qu \in L^2(\mathbb{R}^3) \}.
\]
Here \( H^k(\mathbb{R}^3) \) denotes the standard definition of the Sobolev spaces.

The operator \( H_B \) is self-adjoint and has compact resolvent, therefore its spectrum \( \sigma(H_B) \) consists in a sequence \( \lambda_B = (\lambda_{B,k}) \) of real eigenvalues, counted according to their multiplicities, so that
\[
-\infty < \lambda_{B,1} \leq \lambda_{B,2} \leq \ldots \leq \lambda_{B,k} \rightarrow +\infty \quad \text{as} \quad k \rightarrow \infty.
\]

In the sequel \( \phi_B = (\phi_{B,k}) \) denotes an orthonormal basis of \( L^2(\mathbb{R}^3) \) consisting in eigenfunctions with \( \phi_{B,k} \) associated to \( \lambda_{B,k} \), for each \( k \).

In the rest of this text, we often use the following notation, where \( k \geq 1 \),
\[
\psi_{B,k} = (\partial + iA(\nu)) \phi_{B,k}, \quad \text{on} \quad \partial M
\]
and \( \psi_B = (\psi_{B,k}) \), where \( \nu \) the outward unit normal vector field on \( \partial M \) with respect to the metric \( g \).

We address the question of whether one can recover, in some suitable sense, the magnetic field \( A \) and the potential \( q \) from some asymptotic knowledge of the boundary spectral data \( (\lambda_B, \psi_B) \) with \( B = (A,q) \). As for most inverse problems, the main issues are uniqueness and stability.

1.2. Obstruction to uniqueness. We recall that there is an obstruction to the recovery of the electromagnetic potential \( B \) from the boundary spectral data \( (\lambda_B, \psi_B) \). Indeed, let \( B = (A,q) \), and let \( V \in C^1(\mathbb{R}^3) \) be such that \( V|_{\partial M} = 0 \) and set
\[
\tilde{B} = (A + dV, q).
\]
Then it is straightforward to check that
\[
e^{-iv} \mathcal{H}_B e^{iv} = \mathcal{H}_{\tilde{B}}, \quad (\lambda_B, \psi_B) = (\lambda_{\tilde{B}}, \psi_{\tilde{B}}).
\]
Therefore, the magnetic potential \( A \) cannot be uniquely determined by the boundary spectral data \( (\lambda_B, \psi_B) \) and our inverse problem needs to be stated differently.

According to [36], for every covector \( A \in H^k(\mathbb{R}^3, T^*\mathbb{R}^3) \), there exist uniquely determined \( A^s \in H^k(\mathbb{R}^3, T^*\mathbb{R}^3) \) and \( V \in H^{k+1}(\mathbb{R}^3) \) such that
\[
A = A^s + dV, \quad \delta A^s = 0, \quad V|_{\partial M} = 0.
\]
Following the well established terminology, \( A^s \) and \( dV \) are called respectively the solenoidal and potential parts of the covector \( A \). In view of the obstruction described above, the best one can expect is the simultaneous recovery of \( A^s \) and \( q \) from some knowledge of the boundary spectral data \( (\lambda_B, \psi_B) \). From now on, we focus our attention on this problem.
1.3. Known results. There is a vast literature devoted to inverse spectral problems in one dimension. We refer for instance to the pioneer works by Ambartsumian [2], Borg [4], Levinson [31], Gel’fand and Levitan [20]. In the flat case, the first uniqueness results for inverse spectral problems in dimensions greater or equal to two is due to Nachman, Sylvester and Uhlmann [32]. At almost the same time, Isozaki [21] improved the result by Nachman, Sylvester and Uhlmann by using the Born approximation. He proved that the potential in a Schrödinger equation is uniquely determined by the large eigenvalues and the trace of the normal derivatives of the corresponding eigenfunctions. Developing further Isozaki’s approach, Choulli and Stefanov [15] gave a generalization of Isozaki’s uniqueness result together with a Hölder stability estimate with respect to appropriate metrics for the spectral data. We mention that, following a remark of Isozaki which goes back to [21], the uniqueness and stability results of [15] were stated with only some asymptotic closeness of the boundary spectral data. We mention also the work of [12, 13], dealing with recovery of general non-smooth coefficients from the full boundary spectral data, and the work [25] who have considered a similar inverse spectral problem for Schrödinger operators in an infinite cylindrical waveguide.

Another approach for getting uniqueness in the spectral inverse problem for the Laplace-Beltrami operator was introduced by Belishev [5] and Belishev and Kurylev [6]. This approach consists in reducing the inverse spectral problem under consideration into an inverse hyperbolic problem for which one can apply the so called boundary control method. This method allows to consider the trace of the normal derivative of eigenfunctions only in a part of the boundary. We refer to [6, 24, 23, 29, 30] and [27] in the case of non-smooth coefficients. We mention that none of these papers considered this problem with observations corresponding to some asymptotic knowledge of the boundary spectral data. Actually, to our best knowledge, beside the present paper, there is no other results dealing with inverse spectral problem on non flat manifolds with data similar to the one considered by [15, 25].

One of the first stability estimate for inverse spectral problems was established by Alessandrini and Sylvester [1]. This result was reformulated by the second author in a more precise way in [14]. A similar result in the case of the Laplace-Beltrami operator was proved by the first and the third authors in [9] using the idea introduced in [1]. With the help of a result quantifying the uniqueness of continuation for a Cauchy problem with data on a part of the boundary for a wave equation, the first two authors and Yamamoto [8] proved a double logarithmic stability estimate under the assumption that the potential is known near the boundary. In [15], the second and the last authors provided one of the first Hölder type stability estimate for the multi-dimensional Borg-Levinson theorem of determining the potential from some asymptotic knowledge of the boundary spectral data of the associated Schrödinger operator. In [25], the fourth author, Kavian and Soccorsi proved a similar result for an inverse spectral problem in an infinite cylindrical waveguide.

1.4. Preliminaries. We briefly recall some notations and known results in Riemannian geometry. We refer for instance to [22] for more details. By Riemannian manifold with boundary, we mean a $C^\infty$-smooth manifold with boundary in the usual sense, endowed with a metric $g$.

As before $M$ denotes a compact Riemannian manifold of dimension $n \geq 2$. Fix a local coordinate system $x = (x^1, \ldots, x^n)$ and let $(\tilde{c}_1, \ldots, \tilde{c}_n)$ be the corresponding
tangent vector fields. For \( x \in M \), the inner product and the norm on the tangent space \( T_xM \) are given by

\[
g(X, Y) = \langle X, Y \rangle = \sum_{j,k=1}^{n} g_{jk} X^j Y^k, \\
|X| = \langle X, X \rangle^{1/2}, \quad X = \sum_{i=1}^{n} X^i \partial_i, \quad Y = \sum_{i=1}^{n} Y^i \partial_i.
\]

The cotangent space \( T^*_xM \) is the dual of \( T_xM \). Its elements are called covectors or one-forms. The disjoint union of the tangent spaces \( T_xM \) \( \bigcup_{x \in M} T_xM \) is called the tangent bundle of \( M \). Similarly, the cotangent bundle \( T^*M \) is the disjoint union of the spaces \( T^*_xM \), \( x \in M \). A 1-form \( A \) on the manifold \( M \) is a function that assigns to each point \( x \in M \) a covector \( A_x \in T^*_xM \).

An example of a 1-form is the differential of a function \( f \in C^\infty(M) \), which is defined by

\[
df_x(X) = \sum_{j=1}^{n} X^j \frac{\partial f}{\partial x_j}, \quad X = \sum_{j=1}^{n} X^j \partial_j.
\]

Hence \( f \) defines the mapping \( df : TM \to \mathbb{R} \), which is called the differential of \( f \) given by

\[
df(x, X) = df_x(X).
\]

In local coordinates,

\[
df = \sum_{j=1}^{n} \partial_j f dx^j.
\]

where \((dx^1, \ldots, dx^n)\) is the basis in the space \( T^*_xM \), dual to the basis \((\partial_1, \ldots, \partial_n)\).

The Riemannian metric \( g \) induces a natural isomorphism \( \iota : T_xM \to T^*_xM \) given by \( \iota(X) = \langle X, \cdot \rangle \). For \( X \in T_xM \) denote \( X^\sharp = \iota(X) \), and similarly for \( A \in T^*_xM \) we denote \( A^\flat = \iota^{-1}(A) \), and \( \iota^{-1} \) are called musical isomorphisms. The sharp operator is given by

\[
T^*_xM \to T_xM, \quad A \mapsto A^\sharp,
\]
given in local coordinates by

\[
(a_j dx^j)^\sharp = a^j \partial_j, \quad a^j = \sum_{k=1}^{n} g^{jk} a_k.
\]

Define the inner product of 1-forms in \( T^*_xM \) by

\[
\langle A, B \rangle = \langle A^\sharp, B^\sharp \rangle = \sum_{j,k=1}^{n} g^{jk} a_j b_k = \sum_{j,k=1}^{n} g_{jk} a^j b^k.
\]

The metric tensor \( g \) induces the Riemannian volume

\[
dv^n = |g|^{1/2} dx_1 \wedge \cdots \wedge dx_n.
\]

We denote by \( L^2(M) \) the completion of \( C^\infty(M) \) endowed with the usual inner product

\[
\langle f_1, f_2 \rangle = \int_M f_1(x) \overline{f_2(x)} \, dv^n, \quad f_1, f_2 \in C^\infty(M).
\]
A section of a vector bundle $E$ over the Riemannian manifold $M$ is a $C^\infty$ map $s : M \to E$ such that for each $x \in M$, $s(x)$ belongs to the fiber over $x$. We denote by $C^\infty(M, E)$ the space of smooth sections of the vector bundle $E$. According to this definition, $C^\infty(M, TM)$ denotes the space of vector fields on $M$ and $C^\infty(M, T^*M)$ denotes the space of 1-forms on $M$. Similarly, we may define the spaces $L^2(M, T^*M)$ (resp. $L^2(M, TM)$) of square integrable 1-forms (resp. vectors) by using the inner product

$$\langle A, B \rangle = \int_M \langle A, B \rangle \, dv^n, \quad A, B \in T^*M.$$  

(1.10)

Define the Sobolev space $H^k(M)$ as the completion of $C^\infty(M)$ with respect to the norm

$$\|f\|_{H^k(M)}^2 = \|f\|_{L^2(M)}^2 + \sum_{k=1}^n \|\nabla^k f\|_{L^2(M, T^*M)}^2,$$

where $\nabla^k$ is the covariant differential of $f$ in the metric $g$. If $f$ is a $C^\infty$ function on $M$, then $\nabla f$ is the vector field defined by

$$X(f) = \langle \nabla f, X \rangle,$$

for every vector field $X$ on $M$. In the local coordinates system, the last identity can be rewritten in the form

$$\nabla f = \sum_{i,j=1}^n g^{ij} \frac{\partial f}{\partial x_i} \frac{\partial}{\partial x_j} = (df)^2.$$

The normal derivative of a function $u$ is given by the formula

$$\partial_\nu u := \langle \nabla u, \nu \rangle = \sum_{j,k=1}^n g^{jk} \frac{\partial u}{\partial x_j} \frac{\partial}{\partial x_k},$$

where $\nu$ is the unit outward vector field to $\partial M$.

Likewise, we say that a 1-form $A = a_j dx^j$ belongs to $H^k(M, T^*M)$ if each $a_j \in H^k(M)$. The space $H^k(M, T^*M)$ is a Hilbert space when it is endowed with the norm

$$\|A\|_{H^k(M, T^*M)} = \left( \sum_{j=1}^n \|a_j\|_{H^k(M)}^2 \right)^{\frac{1}{2}}.$$

As usual, the vector space of smooth 2-forms on $M$ is denoted by $\Omega^2(M)$. In local coordinates, a 2-form $\omega$ is represented as

$$\omega = \sum_{j,k=1}^n \omega_{jk} dx^j \wedge dx^k,$$

where $\omega_{jk}$ are real-valued functions on $M$. Similarly as before, $\omega$ is in $H^s(M, \Omega^2(M))$, $s \in \mathbb{R}$, if $\omega_{jk} \in H^s(M)$ for each $j, k$. Additionally, $H^s(M, \Omega^2(M))$ is a Hilbert space for the norm

$$\|\omega\|_{H^s(M, \Omega^2(M))} = \left( \sum_{j,k} \|\omega_{jk}\|_{H^s(M)}^2 \right)^{\frac{1}{2}}.$$

In the rest of this text, the scalar product of $L^2(\partial M)$ is also denoted by $\langle \cdot, \cdot \rangle$:

$$\langle f_1, f_2 \rangle = \int_{\partial M} f_1(x) \overline{f_2(x)} \, d\sigma^{n-1}.$$  

(1.13)
where $d\sigma^{n-1}$ is the volume form of $\partial M$.

1.5. **Main results.** Prior to the statement of our main results, we introduce the notion of simple manifolds \cite{38}. We say that the boundary $\partial M$ is strictly convex if the second fundamental form is positive-definite for any $x \in \partial M$.

**Definition 1.1.** A manifold $M$ is simple if $\partial M$ is strictly convex and, for any $x \in M$, the exponential map $\exp_x : \exp_x^{-1}(M) \rightarrow M$ is a diffeomorphism.

Note that if $M$ is simple, then it is diffeomorphic to a ball, and every two points can be connected by a unique minimizing geodesic depending smoothly on its endpoints. Also, one can extend it to a simple manifold $M_1$ such that $M_1^{\text{int}} \supset M$.

We now introduce the admissible sets of magnetic potentials $A$ and electric potentials $q$. Set

$$\mathcal{B} = W^{2,\infty}(M, T^* M) \oplus L^\infty(M).$$

We endow $\mathcal{B}$ with its natural norm

$$\|B\|_\mathcal{B} = \|A\|_{W^{2,\infty}(M, T^* M)} + \|q\|_{L^\infty(M)}.$$ 

For $r > 0$, set

$$(1.14) \quad \mathcal{B}_r = \{B = (A, q) \in \mathcal{B}, \|B\|_\mathcal{B} \leq r\}.$$ 

Let $B_\ell \in \mathcal{B}_r$, $\ell = 1, 2$, we denote by $(\lambda_{\ell, k}, \phi_{\ell, k})$, $k \geq 1$, the eigenvalues and normalized eigenfunctions of the operator $H_{B_\ell}$.

For $\ell = 1$ or $\ell = 2$, let

$$(1.15) \quad \psi_{\ell, k} = (\partial_\nu + iA_\ell(\nu)) \phi_{\ell, k}, \quad k \geq 1.$$ 

At this point we remark that when $A_1 = A_2$ it is clear that $H_{B_1} - H_{B_2} = q_1 - q_2$ whence by the min-max principle,

$$\sup_{k \geq 1} |\lambda_{1, k} - \lambda_{2, k}| \leq \|q_1 - q_2\|_{L^\infty(M)} < \infty.$$ 

Assume now that $A_1 \neq A_2$ and $\delta A_1 = \delta A_2$. Then we have

$$H_{B_1} - H_{B_2} = -2i(A_1 - A_2)\nabla + |A_1|^2 - |A_2|^2 + q_1 - q_2.$$ 

Thus, $H_{B_1} - H_{B_2} \notin \mathcal{B}(L^2(M))$. Therefore, we can reasonably expect that

$$\sup_{k \geq 1} |\lambda_{1, k} - \lambda_{2, k}| = +\infty.$$ 

Keeping in mind this property and the obstruction described in Section 1.2, it seems natural to expect the recovery of the solenoidal part of the magnetic potential from a rate of growth of the eigenvalues. Our first result give a positive answer to this issue together with the recovery of the electric potential.

**Theorem 1.2.** Assume that $M$ is simple. Let $B_\ell = (A_\ell, q_\ell) \in \mathcal{B}_r$, $\ell = 1, 2$, such that

$$(1.16) \quad \partial_x^\alpha A_1(x) = \partial_x^\alpha A_2(x), \quad x \in \partial M, \quad |\alpha| \leq 1.$$ 

Furthermore, assume that there exists $t \in [0, 1/2)$ so that

$$(1.17) \quad \sup_{k \geq 1} k^{-t/2} |\lambda_{1, k} - \lambda_{2, k}| + \sum_{k \geq 1} k^{-2t/2} \|\psi_{1, k} - \psi_{2, k}\|_{L^2(\partial M)}^2 < \infty.$$ 

Then $A_1^t = A_2^t$. Moreover, under the additional conditions

$$\lim_{k \to +\infty} |\lambda_{1, k} - \lambda_{2, k}| = 0, \quad \text{and} \quad \sum_{k \geq 1} \|\psi_{1, k} - \psi_{2, k}\|_{L^2(\partial M)}^2 < \infty,$$
we have \( q_1 = q_2 \).

In the spirit of [15, 25], we consider also the stability issue for this problem stated as follows.

**Theorem 1.3.** Assume that \( M \) is simple. Let \( B_\ell = (A_\ell, q_\ell) \in \mathcal{B}_r, \ell = 1, 2, \) such that \( A_1 \) and \( A_2 \) satisfies (1.16) and \( q_1 - q_2 \in H^1_0(M) \) satisfies
\[
\|q_1 - q_2\|_{H^1_0(M)} \leq r.
\]
Furthermore, assume that there exists \( t \in (0, 1/2) \) so that
\[
\sup_{k \geq 1} k^{-t/n} |\lambda_{1,k} - \lambda_{2,k}| + \sum_{k \geq 1} \|\psi_{1,k} - \psi_{2,k}\|_{L^2(\partial M)}^2 < \infty.
\]
Then \( A_1^* = A_2^* \) and
\[
\|q_1 - q_2\|_{L^2(M)} \leq C \left( \limsup_{k \to \infty} |\lambda_{1,k} - \lambda_{2,k}| \right)^{\frac{1}{2}} < \infty,
\]
the constant \( C \) only depends on \( r \) and \( M \).

To our best knowledge Theorems 1.2 and 1.3 are the first results dealing with inverse spectral problems for Schrödinger operators, with non-constant leading coefficients, from asymptotic knowledge boundary spectral data similar to the one considered by [15, 25]. Note also that Theorem 1.3 seems to be the first stability result of recovering the electric potential from partial boundary spectral data in such general context (the only other similar results can be found in [8, 15, 25] where stable recovery of Schrödinger operators on a bounded domain, with an Euclidean metric and without magnetic potential, have been considered).

We recall that multi-dimensional Borg-Levinson type theorems for magnetic Schrödinger operators have been already considered in [23, 26, 34]. Among them, only [26] considered the uniqueness issue from boundary spectral data similar to (1.18). The results in the present work can be seen as an improvement of that in [26] in four directions. First of all, we prove for the first time the extension of such results to a general simple Riemannian manifold by proving the connection between our problem and the injectivity of the so called geodesic ray transform borrowed from [3, 19, 36, 38]. In addition, by using some results of [38], we establish stability estimates for this problem where [26] treated only the uniqueness. In contrast to [26], we do not require the knowledge of the magnetic potentials on the neighborhood of the boundary. This condition is relaxed, by considering only some knowledge of the magnetic potentials at the boundary given by (1.16). Finally, we show, for what seems to be the first time, that even a rate of growth of the difference of eigenvalues like (1.17), (1.19) can determine the magnetic potential appearing in a magnetic Schrödinger operator.

The main ingredient in our analysis is a suitable representation formula that involves the magnetic potential \( A \) and the electric potential \( q \) in terms of the Dirichlet-to-Neumann map associated to the equations \( \mathcal{H}_B u - \lambda u = 0 \), for a well chosen set of complex \( \lambda \)'s. In [21, 26], the authors considered such a representation for a bounded domain with flat metric. Using a construction inspired by [7, 9, 16, 17, 18, 39] we show how one can extend such an approach to more general manifolds. Note that this construction differs from the one considered by [16, 17, 18] for recovering the magnetic Schrödinger operators from boundary measurements. Actually, our results hold for a general simple manifold even in the case \( n \geq 3 \), whereas the
determination of Schrödinger operators from boundary measurements in the same context is still an open problem (see [17, 18]).

In this paper we treat also the problem of determining the Neumann realization of magnetic Schrödinger operator. For simplicity and in order to avoid any confusion between the results for the different operators, we give the statement of the result for the Neumann realization of magnetic Schrödinger operator in Theorem 6.1 of Section 6. the result of Theorem 6.1 is stated with an optimal growth of the difference of eigenvalues (see the discussion just after Theorem 6.1).

We believe that following the idea of [10, 26, 28, 35], one can relax the regularity condition imposed to the magnetic potentials as well as condition (1.16). This approach requires the construction of anzats depending on an approximation of the magnetic potential instead of the magnetic potential itself. In order to avoid the inadequate expense of the size of the paper, we do not consider this issue.

1.6. Outline. The outline of the paper is as follows. We review in Section 2 the geodesic ray transform for 1-one forms and functions on a manifold. Section 3 is devoted to an asymptotic spectral analysis. We construct in Section 4 geometrical optics solutions for magnetic Schrödinger equations. We particularly focus our attention on the solvability of the eikonal and the transport equations which are essential in the construction of geometric optic solutions. Additionally, we provide a representation formula. The proof of Theorems 1.2 and 1.3 are given in Section 5. The Neumann case is briefly discussed in Section 6. Finally, we prove some uniform estimates related to the Weyl’s formula for the magnetic Schrödinger operator in appendix A.

2. A short review on the geodesic ray transform on a simple manifold

We collect in this section some known results on the geodesic ray transform for functions and 1-forms on a smooth simple Riemannian manifold \((M, g)\). These results will be used later in this text.

Denote by \(\text{div} X\) the divergence of a vector field \(X \in H^1(M, TM)\) on \(M\), i.e. in local coordinates ([24, page 42]),

\[
(2.1) \quad \text{div} X = \frac{1}{\sqrt{|g|}} \sum_{i=1}^{n} \partial_i \left( \sqrt{|g|} X^i \right), \quad X = \sum_{i=1}^{n} X^i \partial_i.
\]

Using the inner product of a 1-form, we can define the coderivative operator \(\delta\) as the adjoint of the exterior derivative via the relation

\[
(2.2) \quad (\delta A, v) = (A, dv), \quad A \in C^\infty(M, T^*M), \quad v \in C^\infty(M).
\]

Then \(\delta A\) is related to the divergence of vector fields by \(\delta A = \text{div}(A^\flat)\), where the divergence is given by (2.1). If \(X \in H^1(M, TM)\) the divergence formula reads

\[
(2.3) \quad \int_M \text{div} X \, dv^n = \int_{\partial M} \langle X, \nu \rangle \, d\sigma^{n-1}.
\]

For \(f \in H^1(M)\), we have the following Green formula

\[
(2.4) \quad \int_M \text{div} X \, f \, dv^n = -\int_M \langle X, \nabla f \rangle \, dv^n + \int_{\partial M} \langle X, \nu \rangle f \, d\sigma^{n-1}.
\]
Therefore, for \( u, w \in H^2(M) \), the following identity holds
\[
(2.5) \quad \int_M \Delta_A u \overline{w} \, dv^n = - \int_M \langle \nabla_A u, \nabla_A \overline{w} \rangle \, dv^n + \int_{\partial M} (\partial_\nu u + iA(\nu)u) \overline{w} \, d\sigma^{n-1} \\
= \int_M u \Delta_A w \, dv^n + \int_{\partial M} \left( (\partial_\nu u + iA(\nu)u) \overline{w} - u(\partial_\nu w + iA(\nu)w) \right) \, d\sigma^{n-1},
\]
where \( \nabla_A u = \nabla u + iAu^2 \). For \( x \in M \) and \( \theta \in T_xM \), denote by \( \gamma_{x,\theta} \) the unique geodesic starting from \( x \) and directed by \( \theta \).

Recall that the sphere bundle and co-sphere bundle of \( M \) are respectively given by
\[
SM = \{(x, \theta) \in TM; |\theta| = 1\}, \quad S^*M = \{(x, p) \in T^*M; |p| = 1\},
\]

The exponential map \( \exp_x : T_xM \rightarrow M \) is defined as follows
\[
(2.6) \quad \exp_x(v) = \gamma_{x,\theta}(|v|), \quad \theta = \frac{v}{|v|}.
\]

We assume in the rest of this section that \( M \) is simple and we point out that any arbitrary pair of points in \( M \) can be joined by an unique geodesic of finite length.

Given \( (x, \theta) \in SM \) and denote by \( \gamma_{x,\theta} \) the unique geodesic \( \gamma_{x,\theta} \) satisfying the initial conditions \( \gamma_{x,\theta}(0) = x \) and \( \dot{\gamma}_{x,\theta}(0) = \theta \), which is defined on the maximal interval \([\ell_-(x, \theta), \ell_+(x, \theta)]\), with \( \gamma_{x,\theta}(\ell_\pm(x, \theta)) \in \partial M \). Define the geodesic flow \( \phi_t \) by
\[
(2.7) \quad \phi_t : SM \rightarrow SM, \quad \phi_t(x, \theta) = (\gamma_{x,\theta}(t), \dot{\gamma}_{x,\theta}(t)), \quad t \in [\ell_-(x, \theta), \ell_+(x, \theta)],
\]
and observe that \( \phi_{t} \circ \phi_s = \phi_{t+s} \).

Introduce now the submanifolds of inner and outer vectors of \( SM \)
\[
(2.8) \quad \partial_\pm SM = \{(x, \theta) \in SM, x \in \partial M, \pm\langle \theta, \nu(x) \rangle < 0\},
\]
where \( \nu \) is the unit outer normal vector field on \( \partial M \).

Note that \( \partial_+ SM \) and \( \partial_- SM \) are compact manifolds with the same boundary \( S(\partial M) \) and
\[
\partial SM = \partial_+ SM \cup S\partial M \cup \partial_- SM.
\]

It is straightforward to check that \( \ell_\pm : SM \rightarrow \mathbb{R} \) satisfy
\[
\ell_-(x, \theta) \leq 0, \quad \ell_+(x, \theta) \geq 0, \\
\ell_+(x, \theta) = -\ell_-(x, -\theta), \\
\ell_-(x, \theta) = 0, \quad (x, \theta) \in \partial_+ SM, \\
\ell_-(\phi_t(x, \theta)) = \ell_-(x, \theta) - t, \quad \ell_+(\phi_t(x, \theta)) = \ell_+(x, \theta) + t.
\]

To each 1-form \( A \in C^\infty(M, T^*M) \), with \( A = a_j dx^j \), associate the smooth symbol \( \sigma_A \in C^\infty(SM) \) given by
\[
(2.9) \quad \sigma_A(x, \theta) = \sum_{j=1}^n a_j(x) \theta^j = \langle A^2(x, \theta), (x, \theta) \in SM.
\]

Recall that the Riemannian scalar product on \( T_xM \) induces the volume form on \( S_xM \) given by
\[
d\omega_x(\theta) = \sqrt{|g|} \sum_{k=1}^n (-1)^k \theta^k d\theta^1 \wedge \cdots \wedge d\theta^k \wedge \cdots \wedge d\theta^n.
\]
As usual, the notation $\hat{\cdot}$ means that the corresponding factor has been dropped.

We also consider the volume form $dv^{2n-1}$ on the manifold $SM$ defined as follows

$$dv^{2n-1}(x, \theta) = d\omega_x(\theta) \wedge dv^n,$$

where $dv^n$ is the Riemannian volume form on $M$.

By Liouville’s theorem, the form $dv^{2n-1}$ is preserved by the geodesic flow. The corresponding volume form on the boundary $\partial SM = \{(x, \theta) \in SM, x \in \partial M\}$ is given by

$$d\sigma^{2n-2} = d\omega_x(\theta) \wedge d\sigma^{n-1},$$

where $d\sigma^{n-1}$ is the volume form of $\partial M$.

Santaló’s formula will be useful in the sequel:

$$\int_{\partial+SM} F(x, \theta) dv^{2n-1}(x, \theta) = \int_{\partial+SM} \left( \int_0^{\ell_{+,}(x, \theta)} F(\varphi_t(x, \theta)) dt \right) \mu(x, \theta) d\sigma^{2n-2},$$

for any $F \in C(\partial SM)$. Set $\mu(x, \theta) = \langle \theta, \nu(x) \rangle$. For the sake of simplicity $L^2(\partial SM, \mu(x, \theta) d\sigma^{2n-2})$ is denoted by $L^2(\partial SM)$.

Note that $L^2(\partial SM)$ is a Hilbert space when it is endowed with the scalar product

$$(u, v)_\mu = \int_{\partial+SM} u(x, \theta) \nu(x, \theta) \mu(x, \theta) d\sigma^{2n-2}.$$

Until the end of this section, we assume that $M$ is simple.

### 2.1. Geodesic ray transform of 1-forms

The ray transform of 1-forms on $M$ is defined as the linear operator

$$I_1 : C^\infty(M, T^*M) \rightarrow C^\infty(\partial+SM)$$

acting as follows

$$I_1(A)(x, \theta) = \int_{\gamma_{x,\theta}} A = \int_{0}^{\ell_{+,}(x, \theta)} a_j(\gamma_{x,\theta}(t)) \gamma^j_{x,\theta}(t) dt = \int_0^{\ell_{+,}(x, \theta)} \sigma_A(\varphi_t(x, \theta)) dt.$$

It is easy to check that $I_1(d\varphi) = 0$ for any $\varphi \in C^\infty(M)$ satisfying $\varphi|_{\partial M} = 0$. On the other hand, it is known that $I_1$ is injective on the space of solenoidal 1-forms satisfying $\delta A = 0$. Therefore, if $A \in H^1(M, T^*M)$ is so that $I_1(A) = 0$, then $A^s = 0$. Whence, there exists $\varphi \in H^1_0(M) \cap H^2(M)$ such that $A = d\varphi$. As a consequence of this observation, we have

$$|I_1(A)(x, \theta)| = |I_1(A^s)(x, \theta)| \leq C\|A^s\|_{C^0}, \quad A \in C^0(M, T^*M).$$

With reference to [36], we recall that $I_1^s : L^2(\partial+SM) \rightarrow L^2(M, T^*M)$ is given by

$$\left( I_1^s \Psi(x) \right)_{\mu} = \int_{\partial+SM} \theta^T \tilde{\Psi}(x, \theta) d\omega_x(\theta).$$

Here $\tilde{\Psi}$ is the extension of $\Psi$ from $\partial+SM$ to $SM$, which is constant on every orbit of the geodesic flow. That is

$$\tilde{\Psi}(x, \theta) = \Psi(\gamma_{x,\theta}(\ell_{-,}(x, \theta))), \quad \ell_{-,}(x, \theta)) = \Psi(\Phi_{\ell_{-,}(x, \theta)}(x, \theta)), \quad (x, \theta) \in SM.$$

One can check [36] that $I_1$ has a bounded extension, still denoted by $I_1$,

$$I_1 : H^k(M, T^*M) \rightarrow H^k(\partial+SM).$$
We complete this subsection by results borrowed from [38]. We extend \((M, g)\) to a smooth Riemannian manifold \((M_1, g)\) such that \(M_1^{\text{int}} \supset M\) and we consider the normal operator \(N_1 = \mathcal{I}_1^* \mathcal{I}_1\). Then there exist constants \(C_1 > 0, C_2 > 0\) such that

\[
(2.14) \quad C_1 \| A^s \|_{L^2(M)} \leq \| N_1(A) \|_{H^1(M_1)} \leq C_2 \| A^s \|_{L^2(M)},
\]

for any \(A \in L^2(M, T^*M)\). If \(O\) is an open set of \(M_1\), \(N_1\) is an elliptic pseudo-differential operator of order \(-1\) on \(O\) having as principal symbol \(\varrho(x, \xi) = (\varrho_{j,k}(x, \xi))_{1 \leq j, k \leq n}\), where

\[
\varrho_{j,k}(x, \xi) = \frac{c_n}{|\xi|} \left( g_{jk} - \frac{\xi_j \xi_k}{|\xi|^2} \right).
\]

Therefore, for each integer \(k \geq 0\), there exists a constant \(C_k > 0\) such that, for any \(A \in H^k(M, T^*M)\) compactly supported in \(O\), we have

\[
(2.15) \quad \| N_1(A) \|_{H^{k+1}(M_1)} \leq C_k \| A^s \|_{H^k(O)}.
\]

2.2. Geodesic ray transform of functions. Following [36, Lemma 4.1.1], the ray transform of functions is the linear operator

\[
(2.16) \quad \mathcal{I}_0 : C^\infty(M) \longrightarrow C^\infty(\partial_+ \text{SM})
\]

acting as follows

\[
(2.17) \quad \mathcal{I}_0 f(x, \theta) = \int_0^{t_+(x, \theta)} f(\gamma_{x, \theta}(t)) \, dt.
\]

Similarly to \(\mathcal{I}_1\), \(\mathcal{I}_0\) has an extension, still denoted by \(\mathcal{I}_0\):

\[
(2.18) \quad \mathcal{I}_0 : H^k(M) \longrightarrow H^k(\partial_+ \text{SM})
\]

for every integer \(k \geq 0\). We refer to [36, Theorem 4.2.1] for details.

Considering \(\mathcal{I}_0\) as a bounded operator from \(L^2(M)\) into \(L^2_\mu(\partial_+ \text{SM})\), we can compute its adjoint \(\mathcal{I}_0^* : L^2_\mu(\partial_+ \text{SM}) \rightarrow L^2(M)\)

\[
(2.19) \quad \mathcal{I}_0^* \Psi(x) = \int_{S_x M} \tilde{\Psi}(x, \theta) \, d\omega_x(\theta),
\]

where \(\tilde{\Psi}\) is the extension of \(\Psi\) from \(\partial_+ \text{SM}\) to \(\text{SM}\) which is constant on every orbit of the geodesic flow:

\[
\tilde{\Psi}(x, \theta) = \Psi(\gamma_{x, \theta}(t_+(x, \theta))).
\]

Let \(M_1\) be a simple manifold so that \(M_1^{\text{int}} \supset M\) and consider the normal operator \(N_0 = \mathcal{I}_0^* \mathcal{I}_0\). Then there exist two constants \(C_1 > 0, C_2 > 0\) such that

\[
(2.20) \quad C_1 \| f \|_{L^2(M)} \leq \| N_0(f) \|_{H^1(M_1)} \leq C_2 \| f \|_{L^2(M)}
\]

for any \(f \in L^2(M)\), see [38].

If \(O\) is an open set of \(M_1\), \(N_0\) is an elliptic pseudo-differential operator of order \(-1\) on \(\Omega\), whose principal symbol is a multiple of \(|\xi|^{-1}\), see [38]. Therefore there exists a constant \(C_k > 0\) such that, for all \(f \in H^k(O)\) compactly supported in \(O\),

\[
(2.21) \quad \| N_0(f) \|_{H^{k+1}(M_1)} \leq C_k \| f \|_{H^k(O)}.
\]
3. Asymptotic spectral analysis

We fix in all of this section $B_\ell = (A_\ell, q_\ell) \in \mathcal{B}_r$, $\ell = 1, 2$, satisfying the assumptions of Theorem 1.2. As in Section 1, $H_{B_\ell}$, $\ell = 1, 2$, is the operator defined by (1.2) and (1.3) when $B = B_\ell$. Furthermore, for $\lambda \in \rho(H_{B_\ell})$, denote by $R_{B_\ell}(\lambda)$ the resolvent of $H_{B_\ell}$ and, for $s \in [0, 1/2)$, recall the following classical resolvent estimate

$$
\|R_{B_\ell}(\lambda)\|_{L^2(M) : H^s(M)} \leq \frac{C_s}{|3\lambda|^{1-s}}, \quad \ell = 1, 2.
$$

For $f \in H^{3/2}(\partial M)$ and $\lambda \in \rho(H_{B_\ell})$, $\ell = 1, 2$, consider the Dirichlet problem

$$
\begin{cases}
(H_{B_\ell} - \lambda)u = 0 & \text{in } M, \\
 u = f & \text{on } \partial M.
\end{cases}
$$

Let $\kappa$ be a boundary defining function, that is a smooth function $\kappa : \overline{M} \to \mathbb{R}_+$ such that

- $\kappa(x) > 0$ for all $x \in M^{\text{int}}$,
- $\kappa|_{\partial M} = 0$ and $d\kappa|_{\partial M} \neq 0$.

We recall that one can construct such a function by combining local coordinates with boundary distance functions or by considering the first eigenvalue of the Dirichlet Laplacian. We can now state the following result.

**Lemma 3.1.** If $f \in H^{3/2}(\partial M)$ and $\lambda \in \rho(H_{B_\ell})$, then the BVP (3.2) has a unique solution $u_{\ell}(\lambda) = u_{\ell}^f(\lambda) \in H^2(M)$ given by the series

$$
u_{\ell}(\lambda) = \sum_{k \geq 1} \frac{\langle f, \psi_{\ell,k} \rangle}{\lambda - \lambda_{\ell,k}} \phi_{\ell,k},
$$

the convergence takes place in $H^1(M)$. Moreover, for any neighborhood $\mathcal{V}$ of $\partial M$ in $M$, we have

$$
\lim_{\lambda \to -\infty} \left( \|u_{\ell}(\lambda)\|_{L^2(M)} + \|\kappa u_{\ell}(\lambda)\|_{L^2(M)} \right) = 0.
$$

**Proof.** The proof of (3.3) and

$$
\lim_{\lambda \to -\infty} \|u_{\ell}(\lambda)\|^2_{L^2(M)} = 0
$$

is quite similar to that of [26, Lemma 2.1].

The proof of (3.4) is then completed by establishing the following Caccioppoli’s type inequality, where $\lambda < 0$:

$$
\|\kappa u_{\ell}(\lambda)\|_{L^2(M)} \leq C\|u_{\ell}(\lambda)\|_{L^2(M)},
$$

the constant $C$ only depends on $r$ and $M$.

For the sake of simplicity, we omit the subscript $\ell$ in $u_{\ell}(\lambda)$ and $B_{\ell}$. Multiplying the first equation of (3.2) by $\kappa^2 \pi(\lambda)$, using the fact that $\kappa|_{\partial M} = 0$ and applying
Green’s formula, we obtain
\begin{equation}
0 = -\int_M \nabla A u(\lambda) \kappa^2 \nu(\lambda) \, dv^n + \int_M (q - \lambda) \kappa^2 |u(\lambda)|^2 \, dv^n
= \int_M |\kappa du(\lambda)|^2 \, dv^n + 2 \int_M \langle \kappa du(\lambda), \nu(\lambda) \rangle \, dv^n
+ 2 \int_M \langle \kappa \nu(\lambda) A, \kappa du(\lambda) \rangle \, dv^n + \int_M (2i \langle A, \kappa \nu \rangle + (|A|^2 + q - \lambda) \kappa^2 |u(\lambda)|^2 \, dv^n.
\end{equation}

An application of Cauchy-Schwarz’s inequality yields
\begin{equation*}
\|\kappa du(\lambda)\|_{L^2(M)}^2 - \lambda \|\kappa u(\lambda)\|_{L^2(M)}^2 \leq C \|u(\lambda)\|_{L^2(M)} \|\kappa du(\lambda)\|_{L^2(M)} + C \|u(\lambda)\|_{L^2(M)}^2
\leq C' \|u(\lambda)\|_{L^2(M)}^2 + \frac{1}{2} \|\kappa du(\lambda)\|_{L^2(M)}^2.
\end{equation*}

Then, it follows
\begin{equation}
\frac{1}{2} \|\kappa du(\lambda)\|_{L^2(M)}^2 - \lambda \|\kappa u(\lambda)\|_{L^2(M)}^2 \leq C \|u(\lambda)\|_{L^2(M)}^2
\end{equation}
and since \(-\lambda > 0\)
\begin{equation}
\|\kappa du(\lambda)\|_{L^2(M)}^2 \leq C \|u(\lambda)\|_{L^2(M)}^2,
\end{equation}
implicating Caccioppoli’s inequality (3.5). \hfill \square

**Lemma 3.2.** Let \(f \in H^{3/2}(\partial M)\) and, for \(\mu \in \rho(H_{B_1}) \cap \rho(H_{B_2})\), set
\[w_{1,2}(\mu) = u_1(\mu) - u_2(\mu) \in H^2(M),\]
where \(u_\mu(\mu)\) is the corresponding solution to (3.2) with \(B_\ell\) and \(\lambda\) are substituted by \(B_\ell\) and \(\mu\). Then we have that \(w_{1,2}(\mu)\) converges to 0 in \(H^2(M)\) as \(\mu \to -\infty\). In particular, \(\partial_\nu w_{1,2}(\mu) \to 0\) in \(L^2(\partial M)\) as \(\mu \to -\infty\).

**Proof.** For the sake of simplicity, we use in this proof \(w(\mu)\) instead of \(w_{1,2}(\mu)\). Since the trace map \(v \mapsto \partial_\nu v\) is continuous from \(H^2(M)\) into \(L^2(\partial M)\), it is enough to show that \(\|w(\mu)\|_{H^2(M)} \to 0\) when \(\mu \to -\infty\). Let \(\mu < \mu_\ast < -2 |q|/\kappa\), for some fixed \(\mu_\ast < 0\). It is straightforward to check that \(w(\mu)\) is the solution of the boundary value problem
\begin{equation}
\begin{cases}
(H_{B_1} - \mu) w(\mu) = h(\mu) & \text{in } M, \\
w(\mu) = 0 & \text{on } \partial M.
\end{cases}
\end{equation}
Here \(h(\mu)\) is given by
\begin{equation}
h(\mu) = -2i \langle A_2 - A_1, du_2(\mu) \rangle + (V_2 - V_1) u_2(\mu)
\end{equation}
with
\[V_j = -i \delta A_j + |A_j|^2 + q_j, \quad j = 1, 2.

Multiplying the first equation of (3.9) by \(\overline{w}(\mu)\), we apply Green’s formula (2.5) in order to obtain
\[\int_M h(\mu) \overline{w}(\mu) \, dv^n = \int_M H_{B_1} w(\mu) \overline{w}(\mu) \, dv^n - \int_M \mu |w(\mu)|^2 \, dv^n
= \int_M |\nabla A_j w| \, dv^n + \int_M (q - \mu |w|^2 \, dv^n.
\]
We deduce that, for $-\mu$ sufficiently large,
\[
(-\|q\|_\infty - \frac{\mu}{2})\|w(\mu)\|_{L^2(M)}^2 + \frac{|\mu|}{4}\|w(\mu)\|_{L^2(M)}^2 \leq C\|h(\mu)\|_{L^2(M)}^2,
\]
for some positive constant $C$, not dependent on $\mu$, and then we conclude that
\[
|\mu|\|w(\mu)\|_{L^2(M)}^2 \leq C\|h(\mu)\|_{L^2(M)}^2.
\]
Moreover we have
\[
\begin{cases}
(H_{B_1} - \mu \ast) w(\mu) = h(\mu) + (\mu - \mu \ast)w(\mu) & \text{in } M, \\
w(\mu) = 0 & \text{on } \partial M.
\end{cases}
\]
Using that $(H_{B_1} - \mu \ast)^{-1}$ is an isomorphism from $L^2(M)$ onto $H^2(M)$, there exists a constant $C$, depending on $M$ and $B_1$, so that
\[
\|w(\mu)\|_{H^2(M)} \leq C\|h(\mu) + (\mu - \mu \ast)w(\mu)\|_{L^2(M)}^2 \\
\leq C\left(\|h(\mu)\|_{L^2(M)}^2 + |\mu - \mu \ast|\|w(\mu)\|_{L^2(M)}^2\right) \\
\leq C\left(\|h(\mu)\|_{L^2(M)}^2 + 2|\mu|\|w(\mu)\|_{L^2(M)}^2\right),
\]
where the positive constant $C$ is not dependent on $\mu$.

Using now the estimate (3.11), we obtain
\[
\|w(\mu)\|_{H^2(M)} \leq 4C\|h(\mu)\|_{L^2(M)}.
\]
On the other hand, in view of (1.16) there exists $C > 0$ such that
\[
|A_1(x) - A_2(x)| \leq C\kappa(x), \quad x \in M.
\]
Applying (3.15), we obtain
\[
\|h(\mu)\|_{L^2(M)} \leq C'' \left(\|\kappa \mu u_2(\mu)\|_{L^2(M)} + \|u_2(\mu)\|_{L^2(M)}\right)
\]
for some constant $C''$ independent of $\mu$. Then, according to (3.4) in Lemma 3.1, we get
\[
\limsup_{\mu \to -\infty} \|h(\mu)\|_{L^2(M)} = 0,
\]
entailing by (3.14)
\[
\limsup_{\mu \to -\infty} \|w(\mu)\|_{H^2(M)} = 0.
\]
This completes the proof of the lemma. \hfill \Box

The following lemma will be useful in the sequel. We omit its proof since it is quite similar to that in [25, 26].

**Lemma 3.3.** Let $f \in H^{3/2}(\partial M)$ and, for $\mu, \lambda \in \rho(H_{B_1})$, set $w_\ell(\lambda, \mu) = u_\ell(\lambda) - u_\ell(\mu)$, where $u_\ell(\mu)$ is the solution of (3.2) when $\lambda$ is substituted by $\mu$. Then we have
\[
(\partial_\nu + iA_\ell(\nu)) w_\ell(\lambda, \mu) = \sum_{k \geq 1} \frac{(\mu - \lambda)(f, \psi_{\ell,k})}{(\lambda - \lambda_{\ell,k})(\mu - \lambda_{\ell,k})} \psi_{\ell,k},
\]
the convergence takes place in $H^{1/2}(\partial M)$. 

\[
(3.19)
\]
4. Isozaki's Representation Formula

In the present section we provide a version of Isozaki's approach [21], based on the so-called Born approximation method. The usual anzats used to solve the problem of determining the coefficients of a magnetic Laplace-Beltrami operator, from the corresponding Dirichlet-to-Neumann map will be useful in our analysis. Let us describe briefly this method.

In all of this section $B_\ell = (A_\ell, q_\ell) \in \mathcal{B}_\ell$, $\ell = 1, 2$, with $A_\ell$ satisfying (1.16). We extend the covector $A_1$ to a $W^{2,\infty}$ covector on $M_1$ supported in the interior of $M_1$ and still denoted by $A_1$. Then, we consider the extension of $A_2$ to $M_1$, still denoted by $A_2$, defined by

\begin{equation}
A_1(x) = A_2(x), \quad x \in M_1 \setminus M.
\end{equation}

Then, (1.16) implies that $A_2 \in W^{2,\infty}(M_1; T^* M_1)$. We fix also $A = A_1 - A_2$.

4.1. Representation formula. If $u_t(\lambda), \lambda \in \rho(H_{B_1}) \cap \rho(H_{B_2})$, is the solution of (3.2) when $B = B_\ell$, define the Dirichlet-to-Neumann map by

\begin{equation}
\Lambda_{B_\ell}(\lambda) : f \in H^{3/2}(\partial M) \mapsto (\bar{\phi}_\nu + iA_\ell(\nu)) u_t(\lambda) |_{\partial M}, \quad \ell = 1, 2.
\end{equation}

We fix $\psi \in C^2(M)$ a function satisfying the eikonal equation

\begin{equation}
|d\psi|^2 = \sum_{i,j=1}^n g^{ij} \frac{\partial \psi}{\partial x_i} \frac{\partial \psi}{\partial x_j} = 1.
\end{equation}

We set also two functions $\alpha_\ell \in H^2(M)$ solving the transport equations

\begin{equation}
\langle d\psi, d\alpha_\ell \rangle + \frac{1}{2} (\Delta \psi) \alpha_\ell = 0, \quad \ell = 1, 2.
\end{equation}

This function will be given in Section 4.2. Consider also two functions $\beta_{A_\ell} \in H^2(M)$, $\ell = 1, 2$, solutions of the transport equations

\begin{equation}
\langle d\psi, d\beta_{A_\ell} \rangle + i \langle A_\ell, d\psi \rangle \beta_{A_\ell} = 0, \quad \forall x \in M, \quad \ell = 1, 2.
\end{equation}

Henceforth $\tau > 1$ and $\lambda_\tau = \tau + i$. Let

\begin{equation}
\begin{aligned}
\varphi_{1,\tau}^\tau(x) &= e^{i\lambda_\tau \psi(x)} \alpha_1 \beta_{A_1}(x) := e^{i\lambda_\tau \psi(x)} \beta_1^\tau(x), \\
\varphi_{2,\tau}^\tau(x) &= e^{i\lambda_\tau \psi(x)} \alpha_2 \beta_{A_2}(x) := e^{i\lambda_\tau \psi(x)} \beta_2^\tau(x),
\end{aligned}
\end{equation}

where, for $\ell = 1, 2$, $\alpha_\ell$ is a solution of (4.4) and $\beta_{A_\ell}$ is a solution of (4.5).

Define

\begin{equation}
S_{B_\ell}(\tau) = \langle \Lambda_{B_\ell}(\lambda_\tau^2) \varphi_{1,\tau}^\tau, \varphi_{2,\tau}^\tau \rangle = \int_{\partial M} \Lambda_{B_\ell}(\lambda_\tau^2) \varphi_{1,\tau}^\tau \varphi_{2,\tau}^\tau \, d\sigma^{n-1}, \quad \ell = 1, 2.
\end{equation}

Lemma 4.1. We have

\begin{equation}
S_{B_1}(\tau) = \int_{\partial M} \beta_1^\tau \left( \bar{\partial}_B \beta_2 - iA_1(\nu) \beta_2^\tau - i\lambda_\tau \beta_2^\tau \bar{\partial}_B \psi \right) \, d\sigma^{n-1} + \int_{M} \beta_1^\tau \mathcal{H}_{B_1}(\beta_2^\tau) \, dv^n - 2\lambda_\tau \int_{M} \beta_1^\tau \beta_2^\tau \langle A, d\psi \rangle \, dv^n - \int_{M} R_{B_1}(\lambda_\tau^2) \left( e^{i\lambda_\tau \psi} \mathcal{H}_{B_1}(\beta_1^\tau) \right) \left( e^{-i\lambda_\tau \psi} \mathcal{H}_{B_1}(\beta_2^\tau) - 2\lambda_\tau e^{-i\lambda_\tau \psi} \beta_2^\tau \langle A, d\psi \rangle \right) \, dv^n.
\end{equation}
and

\( S_{B_2}(\tau) = \int_{\partial M} \beta_1^{\#} \left( \partial_\nu \beta_2^{\#} - i A_2(\nu) \beta_2^{\#} - i \lambda_\tau \beta_2^{\#} \partial_\nu \right) \, d\sigma^{n-1} + \int_M \beta_1^{\#} H_{B_2}(\beta_2^{\#}) \, dv^n - \int_M R_{B_2}(\lambda_2^2) \left( e^{i \lambda_\tau \psi} (H_{B_2}(\beta_1^{\#}) - 2 \lambda_\tau \langle A, d\psi \rangle \beta_1^{\#}) \right) \left( e^{-i \lambda_\tau \psi} \frac{H_{B_2}(\beta_2^{\#})}{\beta_2^{\#}} \right) \, dv^n. \)

Here \( R_{B_2}(\lambda_2^2) \) is the resolvent of \( H_{B_2}. \)

**Proof.** Direct computations yield

\( (H_{B_1} - \lambda_2^2) \varphi_1^{\#} = e^{i \lambda_\tau \psi} H_{B_1}(\beta_1^{\#}) + e^{i \lambda_\tau \psi} \left( \lambda_2^2 \beta_1^{\#} (|d\psi|^2 - 1) - 2i \lambda_\tau \beta_{A_1} \left( \langle d\psi, d\alpha_1 \rangle + \frac{\alpha_1}{2} \Delta \psi \right) - 2i \lambda_\tau \alpha_1 \left( \langle d\psi, d\beta_{A_1} \rangle + i \langle A_1, d\psi \rangle \beta_{A_1} \right) \right) \)

Taking into account (4.3) and (4.4)-(4.5), with \( \ell = 1 \), the right-hand side of (4.10) becomes

\( (H_{B_1} - \lambda_2^2) \varphi_1^{\#} = e^{i \lambda_\tau \psi} H_{B_1}(\beta_1^{\#}) = e^{i \lambda_\tau \psi} k_1. \)

Denote by \( u_1 \) the solution of the BVP

\[
\begin{cases}
(H_{B_1} - \lambda_2^2) u_1 = 0 & \text{in } M, \\
u_1 = \varphi_1^{\#} & \text{on } \partial M.
\end{cases}
\]

We split \( u_1 \) into two terms, \( u_1 = \varphi_1^{\#} + v_1 \), where \( v_1 \) is the solution of the boundary value problem

\[
\begin{cases}
(H_{B_1} - \lambda_2^2) v_1 = -e^{i \lambda_\tau \psi} k_1 & \text{in } M, \\
u_1 = 0 & \text{on } \partial M.
\end{cases}
\]

Therefore

\( u_1 = \varphi_1^{\#} - (H_{B_1} - \lambda_2^2)^{-1} (e^{i \lambda_\tau \psi} k_1) = \varphi_1^{\#} - R_{B_2}(\lambda_2^2) (e^{i \lambda_\tau \psi} k_1). \)

As

\( S_{B_1}(\tau) = \int_{\partial M} \left( \partial_\nu u_1 + i A_1(\nu) u_1 \right) \overline{\varphi_2^{\#}} \, d\sigma^{n-1}, \)

we get by applying formula (2.5)

\( S_{B_1}(\tau) = \int_M \Delta_A u_1 \overline{\varphi_2^{\#}} \, dv^n - \int_M u_1 \Delta_A \varphi_2^{\#} \, dv^n + \int_{\partial M} \varphi_1^{\#} \left( \partial_\nu \varphi_2^{\#} + i A_1(\nu) \varphi_2^{\#} \right) \, d\sigma^{n-1}. \)
On the other hand, by a simple computation and using (4.3), (4.4) and (4.5), we get

\[
\Delta_{A_1} \varphi_{2,\tau}^* = \Delta_{A_1}(e^{i\varphi_{2,\tau}^*}) = -\nabla_{\tau}^2 \varphi_{2,\tau}^* + e^{i\varphi_{2,\tau}^*}\Delta_{A_1}(\beta_{2}^*) - 2i\nabla_{\tau} e^{i\varphi_{2,\tau}^*} \alpha_2 (\langle d\psi, d\beta_2 \rangle + i\langle A_1, d\psi \rangle \beta_2) + 2i\nabla_{\tau} \beta_2 e^{i\varphi_{2,\tau}^*} \langle d\psi, d\alpha_2 \rangle + \frac{\alpha_2^2}{2} \nabla_{\tau} \psi
\]

\[
= -\nabla_{\tau}^2 \varphi_{2,\tau}^* + e^{i\varphi_{2,\tau}^*}\Delta_{A_1}(\beta_{2}^*) - 2i\nabla_{\tau} e^{i\varphi_{2,\tau}^*} (\beta_2^* - i\langle A_1, d\psi \rangle \beta_2 + i\langle A_1, d\psi \rangle \beta_2)
\]

\[
= -\nabla_{\tau}^2 \varphi_{2,\tau}^* + e^{i\varphi_{2,\tau}^*}\Delta_{A_1}(\beta_{2}^*) + 2i\nabla_{\tau} e^{i\varphi_{2,\tau}^*} \beta_2^* \langle A, d\psi \rangle.
\]

Whence, in light of (4.12), we find

\[
\int_M u_1 \Delta_{A_1} \varphi_{2,\tau}^* \, dv
\]

\[
= \int_M \left( \varphi_{1,\tau}^* - R_{B_1}(\lambda_2^*) \right) \left( e^{i\lambda_2^* \psi} \right) \left( -\nabla_{\tau}^2 \varphi_{2,\tau}^* + e^{i\lambda_2^* \psi} \Delta_{A_1}(\beta_{2}^*) + 2i\lambda_2^* \nabla_{\tau} e^{i\lambda_2^* \psi} \beta_2^* \langle A, d\psi \rangle \right) \, dv,
\]

and, using again (4.12), we get

\[
\int_M \Delta_{A_1} u_1 \varphi_{2,\tau}^* \, dv = - \int_M \mathcal{H}_{B_1} u_1 \varphi_{2,\tau}^* \, dv + \int_M q_1 u_1 \varphi_{2,\tau}^* \, dv
\]

\[
= \int_M \left( \varphi_{1,\tau}^* - R_{B_1}(\lambda_2^*) \right) \left( e^{i\lambda_2^* \psi} \right) \left( -\nabla_{\tau}^2 \varphi_{2,\tau}^* + q_1 \varphi_{2,\tau}^* \right) \, dv.
\]

We deduce that

\[
\int_M \Delta_{A_1} u_1 \varphi_{2,\tau}^* \, dv = \int_M u_1 \Delta_{A_1} \varphi_{2,\tau}^* \, dv
\]

\[
= \int_M \left( \varphi_{1,\tau}^* - R_{B_1}(\lambda_2^*) \right) \left( e^{i\lambda_2^* \psi} \right) \left( -\nabla_{\tau}^2 \varphi_{2,\tau}^* + R_{B_1}(\lambda_2^*) \left( e^{i\lambda_2^* \psi} \right) \right) \, dv
\]

\[
= \int_M \beta_{1}^* \mathcal{H}_{B_1}(\beta_{2}^*) \, dv - 2\lambda_2^* \int_M \beta_{1}^* \beta_{2}^* \langle A, d\psi \rangle \, dv
\]

\[
- \int_M R_{B_1}(\lambda_2^*) \left( e^{i\lambda_2^* \psi} \right) \left( -\lambda_2^* \beta_{2}^* \langle A, d\psi \rangle \right) \, dv.
\]

Moreover

\[
\int_{\mathcal{E}M} \varphi_{1,\tau}^* \left( \nabla_{\nu} \varphi_{2,\tau}^* + iA_1(\nu) \varphi_{2,\tau}^* \right) \, d\sigma^{n-1}
\]

\[
= \int_{\mathcal{E}M} \beta_{1}^* \left( \nabla_{\nu} \beta_{2}^* - iA_1(\nu) \beta_{2}^* - i\lambda_2^* \beta_{2}^* \psi \right) \, d\sigma^{n-1}.
\]

Finally, we get (8.8) by combining (4.11), (4.15) and (4.16).
The proof of (4.9) is quite similar to that of (4.8). But, for the reader’s convenience, we detail the proof of (4.9). By a simple computation we find

\begin{align}
(4.17) \quad (\mathcal{H}_{B_2} - \lambda_2^i) \varphi_{1,\tau}^* &= e^{i\lambda_\tau \psi} \mathcal{H}_{B_2} (\beta_1^*) \\
&+ e^{i\lambda_\tau \psi} \left( \lambda_2^i \beta_1^* (|d\psi|^2 - 1) - 2i\lambda_\tau \beta_A \left( \langle d\psi, d\alpha_1 \rangle \right) + \frac{\alpha_1}{2} \Delta \psi \right) \\
&- 2i\lambda_\tau \alpha_1 \left( \langle d\psi, d\beta_A \rangle + i\langle A_2, d\psi \rangle \beta_A \right) \end{align}

Taking into account (4.3)-(4.4) and (4.5), the right-hand side of (4.17) takes the form

\begin{align}
(4.18) \quad (\mathcal{H}_{B_2} - \lambda_2^i) \varphi_{1,\tau}^* &= e^{i\lambda_\tau \psi(x)} (\mathcal{H}_{B_2} (\beta_1^*) - 2\lambda_\tau \langle A, d\psi \rangle \beta_1^*) \equiv e^{i\lambda_\tau \psi(x) k_2}.
\end{align}

Let \( u_2 \) be the solution of the BVP

\[
\begin{cases}
(\mathcal{H}_{B_2} - \lambda_2^i) u_2 = 0 & \text{in } M, \\
\ u_2 = \varphi_{1,\tau}^* & \text{on } \partial M.
\end{cases}
\]

As for \( u_1 \), we split \( u_2 \) into two terms, \( u_2 = \varphi_{1,\tau}^* + v_2 \), where \( v_2 \) is the solution of the BVP

\[
\begin{cases}
(\mathcal{H}_{B_2} - \lambda_2^i) v_2 = -e^{i\lambda_\tau \psi} k_2 & \text{in } M \\
v_2 = 0 & \text{on } \partial M.
\end{cases}
\]

Therefore

\begin{align}
(4.19) \quad u_2 &= \varphi_{1,\tau}^* - (\mathcal{H}_{B_2} - \lambda_2^i)^{-1} (e^{i\lambda_\tau \psi} k_2) = \varphi_{1,\tau}^* - R_{B_2}(\lambda_2^i)(e^{i\lambda_\tau \psi} k_2).
\end{align}

Since

\begin{align}
(4.20) \quad S_{B_2}(\tau) &= \int_{\partial M} (\bar{\nabla}_\nu u_2 + iA_2(\nu)u_2) \overline{\varphi_{2,\tau}^*} d\sigma^{n-1},
\end{align}

we obtain, by applying formula (2.5),

\begin{align}
(4.21) \quad S_{B_2}(\tau) &= \int_M \Delta_{A_2} u_2 \overline{\varphi_{2,\tau}^*} d\nu^n - \int_M u_2 \Delta_{A_2} \varphi_{2,\tau}^* d\nu^n \\
&+ \int_{\partial M} \varphi_{1,\tau}^* (\bar{\nabla}_\nu \varphi_{2,\tau}^* + iA_2(\nu)\varphi_{2,\tau}^*) d\sigma^{n-1}.
\end{align}

On the other hand, by using (4.3), (4.4) and (4.5), we find

\begin{align}
(4.22) \quad \Delta_{A_2} \varphi_{2,\tau}^* &= \Delta_{A_2} (e^{i\lambda_\tau \psi} \beta_{2}^*) = -\lambda_{2,\tau}^2 \varphi_{2,\tau}^* + e^{i\lambda_\tau \psi} \Delta_{A_2} (\beta_{2}^*).
\end{align}

Whence

\begin{align}
(4.23) \quad \int_M u_2 \Delta_{A_2} \varphi_{2,\tau}^* d\nu^n &= \int_M (\varphi_{1,\tau}^* - R_{B_2}(\lambda_2^i)(e^{i\lambda_\tau \psi} k_2)) \\
&\times \left( -\lambda_{2,\tau}^2 \varphi_{2,\tau}^* + e^{-i\lambda_\tau \psi} \Delta_{A_2}(\beta_{2}^*) \right) d\nu^n
\end{align}

and

\begin{align}
\int_M \Delta_{A_2} u_2 \varphi_{2,\tau}^* d\nu^n &= -\int_M \mathcal{H}_{B_2} u_2 \varphi_{2,\tau}^* d\nu^n + \int_M q_2 u_2 \varphi_{2,\tau}^* d\nu^n \\
&= \int_M (\varphi_{1,\tau}^* - R_{B_2}(\lambda_2^i)(e^{i\lambda_\tau \psi} k_2)) \left( -\lambda_{2,\tau}^2 \varphi_{2,\tau}^* + q_2 \varphi_{2,\tau}^* \right) d\nu^n.
\end{align}
Thus,
\[
(4.24) \quad \int_M \Delta A_2 u_2 \varphi_{2,\tau}^n \, dv^n - \int_M u_2 \Delta A_2 \varphi_{2,\tau}^n \, dv^n
= \int_M \left( \varphi_{1,\tau}^* - R_{B_2}(\lambda_2^\ell) (e^{i \lambda_\tau \varphi_{2,\tau}} k_2) \right) \left( e^{-i \lambda_\tau \varphi H_{B_2}(\beta_2^\ell)} \right) \, dv^n
= \int_M \beta_1^* \overline{H_{B_2}(\beta_2^\ell)} \, dv^n - \int_M R_{B_2}(\lambda_2^\ell) \left( e^{i \lambda_\tau \varphi_{2,\tau}} k_2 \right) \left( e^{-i \lambda_\tau \varphi H_{B_2}(\beta_2^\ell)} \right) \, dv^n
= \int_M \beta_1^* \overline{H_{B_2}(\beta_2^\ell)} \, dv^n
- \int_M R_{B_2}(\lambda_2^\ell) \left( e^{i \lambda_\tau \varphi H_{B_2}(\beta_2^\ell) - 2 \lambda_\tau \langle A, d\psi \rangle \beta_1^*} \right) \left( e^{-i \lambda_\tau \varphi H_{B_2}(\beta_2^\ell)} \right) \, dv^n.
\]
Moreover, we have
\[
(4.25) \quad \int_{\partial M} \varphi_{1,\tau}^* (\partial_{\nu} \varphi_{2,\tau}^* + i A_2(\nu) \varphi_{2,\tau}^*) \, d\sigma^{n-1}
= \int_{\partial M} \beta_1^* \left( \partial_{\nu} \beta_2^* - i A_2(\nu) \beta_2^* - i \lambda_\tau \beta_2^* \partial_{\nu} \psi \right) \, d\sigma^{n-1}.
\]
Inserting (4.25) and (4.24) in (4.21), we obtain
\[
(4.26) \quad S_{B_2}(\tau) = \int_{\partial M} \beta_1^* \left( \partial_{\nu} \beta_2^* - i A_2(\nu) \beta_2^* - i \lambda_\tau \beta_2^* \partial_{\nu} \psi \right) \, d\sigma^{n-1}
+ \int_M \beta_1^* \overline{H_{B_2}(\beta_2^\ell)} \, dv^n
- \int_M R_{B_2}(\lambda_2^\ell) \left( e^{i \lambda_\tau \varphi H_{B_2}(\beta_2^\ell) - 2 \lambda_\tau \langle A, d\psi \rangle \beta_1^*} \right) \left( e^{-i \lambda_\tau \varphi H_{B_2}(\beta_2^\ell)} \right) \, dv^n.
\]
This completes the proof of the Lemma. \(\square\)

Subtracting side by side (4.8) and (4.9), and using the fact that \(A_1 = A_2\) on \(\partial M\), we obtain the following identity, which we will use later in the text.

\[
(4.27) \quad S_{B_1}(\tau) - S_{B_2}(\tau) = -2 \lambda_\tau \int_M \beta_2^* \beta_2^* (A, d\psi) \, dv^n + \int_M \beta_1^* (\overline{H_{B_1} - H_{B_2}}(\beta_2^\ell)) \, dv^n
- \int_M R_{B_1}(\lambda_2^\ell) \left( e^{i \lambda_\tau \varphi H_{B_2}(\beta_1^\ell)} \right) \left( e^{-i \lambda_\tau \varphi \overline{H_{B_1}(\beta_2^\ell)} - 2 \lambda_\tau \langle A, d\psi \rangle \beta_1^*} \right) \, dv^n
+ \int_M R_{B_2}(\lambda_2^\ell) \left( e^{i \lambda_\tau \varphi H_{B_2}(\beta_2^\ell) - 2 \lambda_\tau \langle A, d\psi \rangle \beta_1^*} \right) \left( e^{-i \lambda_\tau \varphi \overline{H_{B_2}(\beta_2^\ell)} \psi} \right) \, dv^n.
\]

4.2. Solving the eikonal and transport equations.

We construct the phase function \(\psi\) solution to the eikonal equation (4.3) and the amplitudes \(\alpha_2\) and \(\beta_2\), \(\ell = 1, 2\), solutions to the transport equations (4.4)-(4.5).

Let \(y \in \partial M\). Denote points in \(M_1\) by \((r, \theta)\) where \((r, \theta)\) are polar normal coordinates in \(M_1\) with center \(y\). That is, \(x = \exp_y(r, \theta)\), where \(r > 0\) and \(\theta \in S_{y}^+ M_1 = \{ \theta \in T_y M_1, \ |\theta| = 1, \ \langle \theta, \nu \rangle < 0 \}\).

In these coordinates (depending on the choice of \(y\)) the metric has the form
\[
\bar{g}(r, \theta) = dr^2 + g_0(r, \theta).
\]
If $u$ is a function in $M$, set, for $r > 0$ and $\theta \in S_y M_1$,

$$\tilde{u}(r, \theta) = u(\exp_y(r\theta)), $$

If $u$ is compactly supported, $\tilde{u}$ is naturally extended by 0 outside $M$.

The geodesic distance to $y$ provide an explicit solution of the eikonal equation (4.3):

$$\psi(x) = d_g(x, y). $$

Since $y \in M_1 \setminus \overline{M}$, we have $\psi \in \mathcal{C}^\infty(M)$ and

$$\tilde{\psi}(r, \theta) = r = d_g(x, y). $$

We now solve the transport equation (4.4). To this and, recall that if $f(r)$ is any function of the geodesic distance $r$, then

$$\Delta_r f(r) = f''(r) + \frac{\varrho^{-1}}{2} \frac{\partial f}{\partial r} f(r). $$

Here $\varrho = \varrho(r, \theta)$ denotes the square of the volume element in geodesic polar coordinates. In the new coordinates system, equation (4.4) takes the form

$$\frac{\partial \tilde{\alpha}}{\partial r} + \frac{1}{4} \tilde{\varrho}^{-1} \frac{\partial \tilde{\varrho}}{\partial r} \tilde{\varrho} = 0. $$

Thus $\tilde{\alpha}$ satisfies

$$\frac{\partial \tilde{\alpha}}{\partial r}(r, \theta) = -\frac{1}{4} \tilde{\varrho}^{-1/4} \frac{\partial \tilde{\varrho}}{\partial r} \eta(y, \theta). $$

Direct computations yield

$$\frac{\partial \tilde{\alpha}}{\partial r}(r, \theta) = -\frac{1}{4} \tilde{\varrho}^{-1} \tilde{\alpha}(r, \theta) \frac{\tilde{\varrho}}{\tilde{r}}. $$

Finally, (4.33) and (4.34) entail

$$\frac{\partial \tilde{\alpha}}{\partial r}(r, \theta) = -\frac{1}{4} \tilde{\varrho}^{-1} \tilde{\alpha}(r, \theta) \frac{\tilde{\varrho}}{\tilde{r}}. $$

In the rest of this subsection we are concerned with transport equation (4.5). Using that, in polar coordinates, $\nabla \psi(x)$ can be expressed in term of $\tilde{\gamma}_{y, \theta}(r)$ (see for instance [7, Appendix C]), we have

$$\langle \tilde{A}_\ell(r, y, \theta), d\psi \rangle = \langle \tilde{A}_\ell^2(r, y, \theta), \nabla \psi \rangle = \sigma_{A_{\ell}}(\varphi_r(y, \theta)) = \tilde{\sigma}_{A_{\ell}}(r, y, \theta). $$

Consequently, in polar coordinates system, (4.5) has the form

$$\frac{\partial \tilde{\psi}}{\partial r} \tilde{\alpha} + i \tilde{\sigma}_{A_{\ell}}(r, y, \theta) \tilde{\beta} = 0, $$

where $\tilde{\sigma}_{A_{\ell}}(r, y, \theta) := \sigma_{A_{\ell}}(\Phi_r(y, \theta)) = \langle \gamma_{y, \theta}(r), A_{\ell}^y(\gamma_{y, \theta}(r)) \rangle$. Thus $\tilde{\beta}$ satisfies

$$\frac{\partial \tilde{\beta}}{\partial r} + i \tilde{\sigma}_{A_{\ell}}(r, y, \theta) \tilde{\beta} = 0. $$

Thus, we can choose $\tilde{\beta}$ defined as follows

$$\tilde{\beta}(y, r, \theta) = \exp \left( i \int_0^{\ell_{+}(y, \theta)} \tilde{\sigma}_{A_{\ell}}(r + s, y, \theta) ds \right). $$
On the other words, we solved (3.4).

In the remainder of this paper we use the following notations:

\begin{equation}
\bar{\beta}_{A_{\ell}}(y,r,\theta) = \exp \left( i \int_0^{\ell+1} \bar{\sigma}_{A_{\ell}}(r+s,y,\theta) ds \right), \quad \ell = 1, 2,
\end{equation}

and

\begin{equation}
\bar{\alpha}_1(r,\theta) = \varrho^{-1/4} \eta(y,\theta), \quad \bar{\alpha}_2(r,\theta) = \varrho^{-1/4}.
\end{equation}

### 4.3. Asymptotic behavior of the boundary representation formula.

We discuss in this subsection the asymptotic behavior of \( S_{B_1}(\tau) - S_{B_2}(\tau) \), as well as the asymptotic behavior of \( [S_{B_1}(\tau) - S_{B_2}(\tau)]/\tau \), as \( \tau \to \infty \).

As before, \( B_{\ell} = (A_{\ell},q_{\ell}) \in \mathcal{B}_r, \ell = 1, 2 \) are so that \( A_{\ell} \) satisfy (1.16). Set

\[ A(x) = (A_1 - A_2)(x), \quad q(x) = (q_1 - q_2)(x). \]

Note that \( A \), extended by 0 outside \( M \), belongs to \( C^0(M_1, T^*M_1) \). We also extend \( q \) by 0 outside \( M \). This extension, still denoted by \( q \), is an element of \( L^2(M_1) \).

**Lemma 4.2.** For any \( \eta \in H^2(S^+_y M_1) \), we have

\begin{equation}
\lim_{\tau \to +\infty} \frac{S_{B_1}(\tau) - S_{B_2}(\tau)}{\tau} = 2i \int_{S^+_y M_1} \left( e^{iq A(y,\theta)} - 1 \right) \eta(y,\theta) d\omega_y(\theta).
\end{equation}

**Proof.** By the resolvent estimate, we have

\begin{equation}
\| R_{B_{\ell}}(\lambda^2) \|_{L^2(M_1)} \leq \frac{1}{|3(\lambda^2)|} = \frac{1}{2\tau}, \quad \ell = 1, 2.
\end{equation}

Inequalities (4.41) and (4.27) yield in a straightforward manner

\begin{equation}
\lim_{\tau \to +\infty} \frac{S_{B_1}(\tau) - S_{B_2}(\tau)}{\tau} = 2 \int_M \frac{\beta_{A_{\ell}}^\ast \beta_{A_{\ell}}}{\tau} \langle A, d\psi \rangle d\nu
\end{equation}

\[ = 2 \int_M \alpha_1 \alpha_2 \beta_{A_{\ell}}^\ast \beta_{A_{\ell}} \langle A, d\psi \rangle d\nu. \]

Applying (4.1) and making the change variable \( x = \exp_y(r\theta) \), with \( r > 0 \) and \( \theta \in S_y M_1 \), we get

\begin{equation}
2 \int_M \langle A, d\psi \rangle (\alpha_1 \alpha_2)(x) (\beta_{A_1} \beta_{A_2})(x) d\nu
\end{equation}

\[ = 2 \int_{S^+_y M_1} \int_0^{\ell+1} \bar{\sigma}_{A_{\ell}}(r,y,\theta)(\bar{\alpha}_1 \bar{\alpha}_2)(r,\theta)(\bar{\beta}_{A_1} \bar{\beta}_{A_2})(r,\theta) \varrho^1/2 dr d\omega_y(\theta)
\]

\[ = 2 \int_{S^+_y M_1} \int_0^{\ell+1} \bar{\sigma}_{A_{\ell}}(r,y,\theta)(\bar{\beta}_{A_1} \bar{\beta}_{A_2})(r,\theta) \eta(y,\theta) dr d\omega_y(\theta)
\]

\[ = \int_{S^+_y M_1} \int_0^{\ell+1} \bar{\sigma}_{A_{\ell}}(r,y,\theta) \exp \left( i \int_0^{\ell+1} \bar{\sigma}_{A_{\ell}}(r+s,y,\theta) ds \right) \eta(y,\theta) dr d\omega_y(\theta). \]
Also
\begin{equation}
\int_0^{\ell_+ (y, \theta)} \tilde{\sigma}_A (r, y, \theta) \exp \left( i \int_0^{\ell_+ (y, \theta)} \tilde{\sigma}_A (r + s, y, \theta) ds \right) dr \\
= -i \int_0^{\ell_+ (y, \theta)} \tilde{\sigma}_r \left[ \exp \left( i \int_0^{\ell_+ (y, \theta)} \tilde{\sigma}_A (r + s, y, \theta) ds \right) \right] dr \\
= i \left[ \exp \left( i \int_0^{\ell_+ (y, \theta)} \tilde{\sigma}_A (s, y, \theta) ds \right) - 1 \right],
\end{equation}
entailing
\begin{equation}
2 \int_M \langle A, d\psi \rangle (\alpha_1 \alpha_2) (x) (\beta_{A_1}, \beta_{A_2}) (x) \, dv^n \\
= 2i \int_{S^+ M_1} (\exp (i \mathcal{I}_1 A (y, \theta)) - 1) \eta (y, \theta) d\omega_y (\theta).
\end{equation}
This in (4.42) gives the expected inequality. \hfill \Box

**Lemma 4.3.** Assume that $A_1 = A_2$ and $q_1 - q_2 \in H^1_0 (M)$. Then, for any $\eta \in H^2 (S^+_M M_1)$, we have
\begin{equation}
\lim_{\tau \to +\infty} (S_{B_1} (\tau) - S_{B_2} (\tau)) = \int_{S^+_M M_1} \mathcal{I}_0 (q) (y, \theta) \eta (y, \theta) d\omega_y (\theta).
\end{equation}

**Proof.** Since $A_1 = A_2$, (4.27) is reduced to the following formula
\begin{equation}
S_{B_1} (\tau) - S_{B_2} (\tau) = \int_M q (x) \beta_{1}^* (x) \beta_{2}^* (x) \, dv^n \\
- \int_M R_{B_1} (\lambda_1^2) \left( e^{i\lambda_1 \psi} \mathcal{H}_{B_1} \beta_{1}^* \right) (e^{-i\lambda_1 \psi} \mathcal{H}_{B_1} \beta_{2}^*) \, dv^n \\
+ \int_M R_{B_2} (\lambda_2^2) \left( e^{i\lambda_2 \psi} \mathcal{H}_{B_2} \beta_{1}^* \right) (e^{-i\lambda_2 \psi} \mathcal{H}_{B_2} \beta_{2}^*) \, dv^n.
\end{equation}
Once again the resolvent estimate enables us to get
\begin{equation}
\lim_{\tau \to +\infty} (S_{B_1} (\tau) - S_{B_2} (\tau)) = \int_M q (x) (\alpha_1 \alpha_2) (x) \, dv^n.
\end{equation}
We complete the proof by mimicking the end of the previous proof in order to obtain
\begin{equation}
\int_M q (x) (\alpha_1 \alpha_2) (x) \, dv^n = \int_{S^+_M M_1} \mathcal{I}_0 (q) (y, \theta) \eta (y, \theta) d\omega_y (\theta).
\end{equation}
This completes the proof. \hfill \Box

5. **Proof of the main results**

5.1. **Asymptotic behavior of the spectral data.** Prior to the completion of the proof of Theorems 1.2 and 1.3, we establish some technical lemmas. Assumptions and notations are the same as in the preceding one.
Lemma 5.1. For $t \in [0, 1/2]$ and $\ell = 1, 2$, we have

$$
\sum_{k \geq 1} k^{2t/n} \left| \frac{\langle \varphi^*_{1, \tau}, \psi_{\ell, k} \rangle}{\lambda_{\ell, k} - \lambda^2} \right|^2 \leq C_{\ell} t^{2n} \|\eta\|_{H^2(S_y^+ M_1)}^2
$$

and

$$
\sum_{k \geq 1} k^{2t/n} \left| \frac{\langle \varphi^*_{2, \tau}, \psi_{2, k} \rangle}{\lambda_{\ell, k} - \lambda^2} \right|^2 \leq C_{\ell} t^{2n},
$$

the constant $C_{\ell}$ depends on $t$, $M$, $r$ and $B_\ell$ if $t > 0$, and it is independent on $B_\ell$ when $t = 0$.

Proof. By Lemma 3.1 the solution of the boundary value problem (3.2), with $f = \varphi^*_{1, \tau}$, $\lambda = \lambda_\tau$ and $B = B_1$, is given by the series

$$
u_1(\lambda_\tau) = \sum_{k \geq 1} \frac{\langle \varphi^*_{1, \tau}, \psi_{1, k} \rangle}{\lambda_{1, k}^2 - \lambda_\tau^2} \phi_{1, k}.
$$

If $\mu = 2r + 1$, then the operator $H_{B_\ell} + \mu$ is positive. Indeed, for $u \in H^1_0(M)$, we have

$$
\int_M (H_{B_\ell} + \mu) u \eta \, dv = \int_M |\nabla_A u|^2 \, dv + \int_M (q_\ell + \mu)|u|^2 \, dv
\geq \int_M |du|^2 \, dv + (\mu - \|q_\ell\|_{L^2} - 2\|A_\ell\|_{L^2}) \int_M |u|^2 \, dv.
$$

Since $\mathcal{D}((H_{B_\ell} + \mu)^{1/2}) = H^1_0(M)$ we have, by interpolation, $\mathcal{D}((H_{B_\ell} + \mu)^{1/2}) = H^1_0(M) = H^1(M)$ (e.g. [33, Chapter 1, Theorems 11.1 and 11.6]). Whence, for $w \in H^1(M)$, we have

$$
\sum_{k \geq 1} (1 + |\lambda_{1, k}|)^4 |(w, \phi_{1, k})|^2 \leq C_\ell \|w\|_{H^1(M)}^2, \quad \ell = 1, 2,
$$

the constant $C_\ell$ only depends on $t$, $r$ and $M$ and $B_\ell$.

On the other hand, we get from (4.12)

$$
\|u_1(\lambda_\tau)\|_{H^1(M)} \leq \|\varphi^*_{1, \tau}\|_{H^1(M)} + \|R_{B_1}(\lambda_\tau^2)(e^{i\lambda_\tau \psi H_{B_1}})(\beta^*_{1, \tau})\|_{H^1(M)}
\leq C t^{4n} \|\eta\|_{H^2(S_y^+ M_1)}.
$$

Here again the constant $C$ only depends on $t$, $r$, $M$ and $B_1$, where we used that $\exp_{-1}(M) \subset \{r \theta : r > 0, \theta \in S^+_y(M_1)\}$ in order to restrict the norm of $\eta$ to $S^+_y M_1$.

This estimate and (5.4) with $w = u_1(\lambda_\tau)$ and $\ell = 1$ entail

$$
\sum_{k \geq 1} (1 + |\lambda_{1, k}|)^4 |(u_1(\lambda_\tau), \phi_{1, k})|^2 \leq C_\ell t^{2n} \|\eta\|_{H^2(S_y^+ M_1)}^2.
$$

We get the first estimate (5.1) for $\ell = 1$, by using (A.1) in Appendix A and the identity

$$
(u_1(\lambda_\tau), \phi_{1, k}) = \frac{\langle \varphi^*_{1, \tau}, \psi_{1, k} \rangle}{\lambda_{1, k}^2 - \lambda_\tau^2}.
$$

To prove the first inequality (5.1) for $\ell = 2$, we consider $u_2(\lambda_\tau)$, the solution of the BVP (3.2) when $\lambda = \lambda_\tau$, $f = \varphi^*_{1, \tau}$ and $B = B_2$. By Lemma 3.1, this solution is...
given by the series

\begin{equation}
(5.8) \quad u_2(\lambda_\tau) = \sum_{k \geq 1} \frac{\langle \varphi_{1, \tau}^*, \psi_{2, k} \rangle}{\lambda_2^2 - \lambda_{2, k}} \phi_{2, k}.
\end{equation}

On the other hand, we get from (4.19) and (3.1)

\begin{equation}
(5.9) \quad \|u_2(\lambda_\tau)\|_{H^1(M)} \leq \|\tau_1^*\|_{H^1(M)}
+ \|R_{B_1}(\lambda_2^2)(e^{i\lambda_\tau \psi} (H_{B_2}(\beta_1^*) - 2\lambda_\tau \langle A, d\psi \rangle \beta_2^*)\|_{H^1(M)}
\leq C \left( \tau^t + \frac{|\lambda_\tau|}{\tau_1^{1-t}} \right) \|\eta\|_{H^2(S^*_\nu M_1)} \leq C \tau^t \|\eta\|_{H^2(S^*_\nu M_1)}.
\end{equation}

Applying again (5.4) with \( w = u_2(\lambda_\tau) \) and \( \ell = 2 \) entail

\begin{equation}
(5.10) \quad \sum_{k \geq 1} (1 + |\lambda_{2, k}|)^t |(u_2(\lambda_\tau), \phi_{2, k})|^2 \leq C \tau^2 \|\eta\|_{H^2(S^*_\nu M_1)}^2.
\end{equation}

Since

\begin{equation}
(5.11) \quad (u_2(\lambda_\tau), \phi_{2, k}) = \frac{\langle \varphi_{1, \tau}^*, \psi_{2, k} \rangle}{\lambda_2^2 - \lambda_{2, k}}.
\end{equation}

we obtain (5.1) with \( \ell = 2 \).

The second inequality of (5.2) is proved similarly. \( \square \)

Let us recall some notations that we introduced in Section 3. For \( f \in H^{3/2}(\partial M) \) fixed and \( \lambda, \mu \in \rho(H_{B_1}) \cap \rho(H_{B_2}) \), if \( u_\lambda(\lambda) \) (resp. \( u_\mu(\mu) \)) is the solution of the boundary value problem (3.2) for \( B = B_\ell \) (resp. \( B = B_\ell \) and \( \lambda = \mu \), \( \ell = 1, 2 \), we have posed

\begin{equation}
(5.12) \quad w_{\ell}(\lambda, \mu) = u_\lambda(\lambda) - u_\mu(\mu),
\end{equation}

\begin{equation}
(5.13) \quad w_{1,2}(\lambda, \mu) = u_1(\lambda) - u_2(\mu).
\end{equation}

Let

\begin{equation}
K(\tau, \mu, f) = (\partial_\tau + iA_1(\nu)) w_1(\lambda_\tau, \mu) - (\partial_\nu + iA_2(\nu)) w_2(\lambda_\tau, \mu) \quad \text{on} \quad \partial M.
\end{equation}

Then, by (3.19), we obtain

\begin{equation}
(5.14) \quad K(\tau, \mu, f) = \sum_{k \geq 1} \left[ \frac{(\mu - \lambda_2^2) \langle f, \psi_{1, k} \rangle}{(\lambda_2^2 - \lambda_{1, k})(\mu - \lambda_{1, k})} \psi_{1, k} - \frac{(\tau - \lambda_2^2) \langle f, \psi_{2, k} \rangle}{(\lambda_2^2 - \lambda_{2, k})(\mu - \lambda_{2, k})} \psi_{2, k} \right].
\end{equation}

We define

\begin{equation}
(5.15) \quad \mathcal{L}(\tau, \mu) = \langle K(\tau, \mu, \varphi_{1, \tau}^*), \varphi_{2, \tau}^* \rangle.
\end{equation}

From (5.14), we get

\begin{equation}
(5.16) \quad \mathcal{L}(\tau, \mu) = \sum_{k \geq 1} (\mu - \lambda_2^2) \left[ \frac{\langle \varphi_{1, \tau}^*, \psi_{1, k} \rangle \langle \psi_{1, k}, \varphi_{2, \tau}^* \rangle}{(\lambda_2^2 - \lambda_{1, k})(\mu - \lambda_{1, k})} - \frac{\langle \varphi_{1, \tau}^*, \psi_{2, k} \rangle \langle \psi_{2, k}, \varphi_{2, \tau}^* \rangle}{(\lambda_2^2 - \lambda_{2, k})(\mu - \lambda_{2, k})} \right].
\end{equation}

Define

\begin{equation}
(5.17) \quad \mathcal{L}^*(\tau) = \sum_{k \geq 1} \mathcal{L}^*_{1, k}(\tau) + \sum_{k \geq 1} \mathcal{L}^*_{2, k}(\tau) + \sum_{k \geq 1} \mathcal{L}^*_{3, k}(\tau),
\end{equation}

with

\begin{equation}
(5.18) \quad \mathcal{L}^*_{1, k}(\tau) = \frac{\langle \varphi_{1, \tau}^*, \psi_{1, k} \rangle \langle \psi_{1, k}, \varphi_{2, \tau}^* \rangle}{\lambda_2^2 - \lambda_{1, k}}.
\end{equation}
\[ L_{2,k}^*(\tau) = \frac{\langle \varphi_{1,\tau}^{*}, \psi_{2,k} \rangle \langle \psi_{1,k} - \psi_{2,k}, \varphi_{2,\tau}^* \rangle}{\lambda_2^2 - \lambda_1,k}, \]

\[ L_{3,k}^*(\tau) = \langle \varphi_{1,\tau}^* , \psi_{2,k} \rangle \langle \psi_{2,k} , \varphi_{2,\tau}^* \rangle \left( \frac{1}{\lambda_2^2 - \lambda_1,k} - \frac{1}{\lambda_2^2 - \lambda_2,k} \right). \]

**Lemma 5.2.** Under assumption (1.17), \( \mathcal{L}(\tau, \mu) \) converges to \( L^*(\tau) \) as \( \mu \to -\infty \) and, for \( t \in [0, 1/2] \), we have

\[ \limsup_{n \to \infty} \tau^{-n} \| L^*(\tau) \| \leq C \| \eta \| H^2(S_{\varepsilon,M_1}) \operatorname{sup} \sup_{n \to \infty} k^{-n} |\lambda_{1,k} - \lambda_{2,k}|. \]

**Proof.** We split \( L(\tau, \mu) \) into three series

\[ L(\tau, \mu) = \sum_{k=1} \mathcal{L}_{1,k}(\mu, \tau) + \sum_{k=1} \mathcal{L}_{2,k}(\mu, \tau) + \sum_{k=1} \mathcal{L}_{3,k}(\mu, \tau), \]

with

\[ \mathcal{L}_{1,k}(\tau, \mu) = (\mu - \lambda_2^2) \frac{\langle \varphi_{1,\tau}^{*}, \psi_{1,k} - \psi_{2,k} \rangle \langle \psi_{1,k} - \psi_{2,k}, \varphi_{2,\tau}^* \rangle}{(\lambda_2^2 - \lambda_1,k)(\mu - \lambda_1,k)}, \]

\[ \mathcal{L}_{2,k}(\tau, \mu) = (\mu - \lambda_2^2) \frac{\langle \varphi_{1,\tau}^* , \psi_{2,k} \rangle \langle \psi_{1,k} - \psi_{2,k} , \varphi_{2,\tau}^* \rangle}{(\lambda_2^2 - \lambda_1,k)(\mu - \lambda_1,k)}, \]

\[ \mathcal{L}_{3,k}(\tau, \mu) = (\mu - \lambda_2^2) \langle \varphi_{1,\tau}^{*} , \psi_{2,k} \rangle \langle \psi_{2,k} , \varphi_{2,\tau}^* \rangle \left( \frac{1}{(\lambda_2^2 - \lambda_1,k)(\mu - \lambda_1,k)} - \frac{1}{(\lambda_2^2 - \lambda_2,k)(\mu - \lambda_2,k)} \right), \]

Under assumption (1.17) and in light of (5.1), we can see that the series in \( \mathcal{L}_{1,k}(\tau, \mu) \), \( \mathcal{L}_{2,k}(\tau, \mu) \) and \( \mathcal{L}_{3,k}(\tau, \mu) \) converge uniformly with respect to \( \mu \ll -1 \). Therefore, \( \mathcal{L}(\tau, \mu) \) converges to \( L^*(\tau) \) as \( \mu \to -\infty \).

We have

\[ |\mathcal{L}_{1,k}^*(\tau)| \leq \| \varphi_{1,\tau}^{*} \|_{L^2(S_M)} \| \psi_{1,k} - \psi_{2,k} \|_{L^2(S_M)} \left| \frac{\langle \psi_{1,k} - \varphi_{2,\tau}^* \rangle}{\lambda_2^2 - \lambda_1,k} \right|, \]

\[ |\mathcal{L}_{2,k}^*(\tau)| \leq \| \varphi_{1,\tau}^{*} \|_{L^2(S_M)} \| \varphi_{2,\tau}^{*} \|_{L^2(S_M)} \| \psi_{1,k} - \psi_{2,k} \|_{L^2(S_M)} \left| \frac{\langle \psi_{1,k} - \varphi_{2,\tau}^* \rangle}{\lambda_2^2 - \lambda_1,k} \right|, \]

\[ |\mathcal{L}_{3,k}^*(\tau)| \leq \| \varphi_{1,\tau}^{*} \|_{L^2(S_M)} \| \psi_{1,k} - \psi_{2,k} \|_{L^2(S_M)} \left| \frac{\langle \psi_{2,k} - \varphi_{2,\tau}^* \rangle}{\lambda_2^2 - \lambda_1,k} \right|, \]

But

\[ \sup_{\tau > 1} \| \varphi_{1,\tau}^{*} \|_{L^2(S_M)} \leq \| \beta_1^* \|_{L^2(S_M)} \leq C \| \eta \|_{H^2(S_{\varepsilon,M_1})}, \]

and

\[ \sup_{\tau > 1} \| \varphi_{2,\tau}^{*} \|_{L^2(S_M)} \leq \| \beta_1^* \|_{L^2(S_M)} \leq C. \]
the constant $C$ only depends on $M$. This estimate entails in particular that
\[
\limsup_{\tau \to +\infty} \tau^{-t} |\mathcal{L}_{1,k}^*(\tau)| = 0, \quad k \geq 1.
\]
Thus, for an arbitrary positive integer $n_1$, we get
\[
\limsup_{\tau \to +\infty} \tau^{-t} \sum_{k=1}^{\infty} |\mathcal{L}_{1,k}^*(\tau)| = \limsup_{\tau \to +\infty} \tau^{-t} \sum_{k=n_1}^{\infty} |\mathcal{L}_{1,k}^*(\tau)|.
\]
This estimate together with (5.1), (5.19), (5.22) and (5.23) imply
\[
\tau^{-t} \sum_{k=n_1}^{\infty} |\mathcal{L}_{1,k}^*(\tau)| \leq C \left( \sup_{\tau > 1} \tau^{-2t} \sum_{k=1}^{\infty} k^{2t/\eta} \left| \frac{\langle \psi_{1,k}, \varphi_{2,k}^* \rangle}{\lambda^2 - \lambda_{1,k}} \right|^2 \right)^{1/2} 
\times \left( \sum_{k=n_1}^{\infty} k^{-2t/\eta} \| \psi_{1,k} - \psi_{2,k} \|^2_{L^2(\Omega_M)} \right)^{1/2}
\leq C \left( \sum_{k=n_1}^{\infty} k^{-2t/\eta} \| \psi_{1,k} - \psi_{2,k} \|^2_{L^2(\Omega_M)} \right)^{1/2},
\]
the constant $C$ is independent on $\tau$. Since the last term goes to zero as $n_1$ tends to $\infty$ by (1.18), we easily get
\[
\limsup_{\tau \to +\infty} \tau^{-t} \sum_{k=1}^{\infty} |\mathcal{L}_{1,k}^*(\tau)| = 0.
\]
In the sequel, we use the following useful observation: for $r > 1$ the map $\tau \mapsto |\lambda^2 - r|$ reach its minimum at $\tau = \sqrt{r-1}$. Hence
\[
|\lambda^2 - r| \geq 2\sqrt{r-1}, \quad \tau > 0.
\]
This observation together with (5.1), (5.20) and (A.1) in Appendix A yield
\[
\limsup_{\tau \to +\infty} \tau^{-t} \sum_{k=1}^{\infty} |\mathcal{L}_{2,k}^*(\tau)| = \limsup_{\tau \to +\infty} \tau^{-t} \sum_{k=n_1}^{\infty} |\mathcal{L}_{2,k}^*(\tau)|
\leq C \sum_{k=n_1}^{\infty} k^{-1/\eta} \| \psi_{1,k} - \psi_{2,k} \|^2_{L^2(\Omega_M)}
+ C \left( \sup_{\tau > 1} \tau^{-2t} \sum_{k=1}^{\infty} k^{2t/\eta} \left| \frac{\langle \psi_{1,k}, \varphi_{2,k}^* \rangle}{\lambda^2 - \lambda_{1,k}} \right|^2 \right)^{1/2} \left( \sum_{k=n_1}^{\infty} k^{-2t/\eta} \| \psi_{1,k} - \psi_{2,k} \|^2_{L^2(\Omega_M)} \right)^{1/2}
\leq C \sum_{k=n_1}^{\infty} k^{-2t/\eta} \| \psi_{1,k} - \psi_{2,k} \|^2_{L^2(\Omega_M)} + C \left( \sum_{k=n_1}^{\infty} k^{-2t/\eta} \| \psi_{1,k} - \psi_{2,k} \|^2_{L^2(\Omega_M)} \right)^{1/2}.
\]
Then, using again the fact that $n_1$ is arbitrary and (1.17), we find
\[
\limsup_{\tau \to +\infty} \tau^{-t} \sum_{k=1}^{\infty} |\mathcal{L}_{2,k}^*(\tau)| = 0.
\]
The same argument as before enables us to obtain
\[
\limsup_{\tau \to +\infty} \tau^{-t} \sum_{k=1}^{\infty} |\mathcal{L}_{3,k}^*(\tau)| \leq C \| \eta \|_{H^2(S^*_M \Omega_M)} \limsup_{\tau \to +\infty} \tau^{-t/\eta} \| \lambda_{1,k} - \lambda_{2,k} \|.
\]
The expected result follows from (5.24), (5.25) and (5.26). □

5.2. End of the proof of the main results. We are now ready to complete the proof of Theorems 1.2 and 1.3.

Proof of Theorem 1.2. Since \( A_\ell, \ell = 1, 2 \), satisfy (1.16) and \( w_{1,2}(\mu) = 0 \) on \( \partial M \), we easily obtain the following identity, useful in the sequel,

\[ \mathcal{K}(\tau, \mu, \varphi^*_{1,\tau}) = (\partial_\tau + iA_1(\nu))u_1(\lambda) - (\partial_\tau + iA_2(\nu))u_2(\lambda) - \partial_\tau w_{1,2}(\mu) \quad \text{on} \quad \partial M. \]

By formula (5.15) we get

\[ \mathcal{L}(\tau, \mu) = \int_{\partial M} \mathcal{K}(\tau, \mu, \varphi^*_{1,\tau})\varphi^*_{2,\tau} \, d\sigma^{n-1} \]

\[ = \int_{\partial M} (\partial_\tau + iA_1(\nu))u_1(\lambda)\varphi^*_{2,\tau} \, d\sigma^{n-1} - \int_{\partial M} (\partial_\tau + iA_2(\nu))u_2(\lambda)\varphi^*_{2,\tau} \, d\sigma^{n-1} \]

\[ = \Lambda_{B_1}(\lambda^2)\varphi^*_{1,\tau}\varphi^*_{2,\tau} \, d\sigma^{n-1} - \int_{\partial M} \Lambda_{B_2}(\lambda^2)\varphi^*_{1,\tau}\varphi^*_{2,\tau} \, d\sigma^{n-1} \]

\[ = S_{B_1}(\tau) - S_{B_2}(\tau) - \int_{\partial M} \partial_\tau w_{1,2}(\mu)\varphi^*_{2,\tau} \, d\sigma^{n-1}. \]

According to Lemmas 3.2 and 5.2, formula (5.28) and passing to the limit as \( \mu \) goes to \(-\infty\), we get

\[ S_{B_1}(\tau) - S_{B_2}(\tau) = \mathcal{L}^*(\tau). \]

Furthermore, from (5.18) we have \( \tau^{-t}(S_{B_1}(\tau) - S_{B_2}(\tau)) \) is bounded for \( \tau > 1 \) and \( t \in [0, 1/2] \). Then \( \tau^{-1}(S_{B_1}(\tau) - S_{B_2}(\tau)) \) goes to zero as \( \tau \) tends to \( \infty \). This in (4.40) yields,

\[ \int_{S^+_y M_1} \left( e^{i\mathcal{I}_1 A(y, \theta)} - 1 \right) \eta(y, \theta) \, d\omega_y(\theta) = 0. \]

Since \( \eta \) is arbitrary in \( H^2(S_y M) \), we obtain that \( \mathcal{I}_1 A(y, \theta) \in 2\pi\mathbb{Z} \) for any \( \theta \in S^+_y M_1 \). On the other hand, since \( \partial M_1 \) is strictly convex, \( S^+_y M_1 \ni \theta \mapsto \ell_+(y, \theta) \) is continuous, and letting \( \theta \) tend to a tangent direction \( \theta_0 \in S_y \partial M_1 \) we get

\[ \lim_{\theta \to \theta_0} \ell_+(y, \theta) = 0 \]

hence

\[ 2\pi m = \lim_{\theta \to \theta_0} \mathcal{I}_1 A(y, \theta) = 0 \]

and therefore

\[ \mathcal{I}_1 A(y, \theta) = 0, \quad \theta \in S^+_y M_1 \]

which implies that \( \mathcal{I}_1 A = 0 \), because \( y \in \partial M_1 \) is arbitrary. From (2.14), we deduce that the solenoidal part \( A^s \) in the Hodge decomposition of the 1-form \( A \) is equal to zero. This completes the proof of the first part of Theorem 1.2.

Now let us consider the second part of the theorem. For this purpose, we assume that condition (1.18) is fulfilled and we would like to show that \( q_1 = q_2 \). Note first
that the condition \( A^* = 0 \) implies \( dA = 0 \) and, since \( M_1 \) is simply connected, there exists \( \varphi \in W^{3,\infty}(M_1) \) such that \( d\varphi = A \). Since \( A = 0 \) on \( M_1 \setminus M \) by eventually extracting a constant to \( \varphi \) we may assume that \( \varphi = 0 \) on \( M_1 \setminus M \). In particular we have \( \varphi|_{\partial M} = \partial_{\nu}\varphi|_{\partial M} = 0 \). Let \( B_3 = (A_1, q_2) \). Applying (1.5), we deduce that

\[
e^{-i\varphi} H_{B_3} e^{i\varphi} = H_{B_3}.
\]

In particular, for \( \lambda_{3,k}, k \geq 1 \), the non-decreasing sequence of eigenvalues of \( H_{B_3} \) we have \( \lambda_{3,k} = \lambda_{2,k} \) and \( \phi_{3,k} = e^{-i\varphi} \phi_{2,k} \) corresponds to an orthonormal basis of eigenfunctions of \( H_{B_3} \). Moreover, fixing \( \psi_{3,k} = (\partial_{\nu} + i A_2(\nu)) \phi_{3,k} \), we deduce that

\[
\psi_{3,k}(x) = (\partial_{\nu} + i A_1(\nu)) e^{-i\varphi} \phi_{2,k}(x) = e^{-i\varphi} (\partial_{\nu} + i A_1(\nu) - i \partial_{\nu} \varphi) \phi_{2,k}(x) = (\partial_{\nu} + i A_2(\nu)) \phi_{2,k}(x) = \psi_{2,k}(x), \quad x \in \partial M.
\]

Combining this with (1.18), we deduce that

\[
\lim_{k \to \infty} |\lambda_{1,k} - \lambda_{3,k}| = 0, \quad \text{and} \quad \sum_{k \geq 1} \|\psi_{1,k} - \psi_{3,k}\|_{L^2(\partial M)}^2 < \infty.
\]

In view of this gauge invariance property, from now on, without lost of generality, we may assume that \( A_1 = A_2 \). According to (1.18), with \( t = 0 \), the right hand side of (5.18) is equal to zero.

**Proof of Theorem 1.3.** We already proved that \( dA_1 = dA_2 \) in Theorem 1.2 and according to the gauge invariance property of the boundary spectral data, without lost of generality, we may assume that \( A_1 = A_2 \). Then a straightforward application of the min-max principle yields

\[
|\lambda_{1,k} - \lambda_{2,k}| \leq \|q_1 - q_2\|_{L^\infty(M)}.
\]

In that case (1.19) is reduced to

\[
\sum_{k \geq 1} \|\psi_{1,k} - \psi_{2,k}\|_{L^2(\partial M)}^2 < \infty.
\]

Combining this with (4.45), (5.18) for \( t = 0 \) (which is valid in the present case) and taking into account that

\[
\limsup_{\tau \to +\infty} |S_{B_1}(\tau) - S_{B_2}(\tau)| = \limsup_{\tau \to +\infty} |\mathcal{C}^*(\tau)|,
\]

we obtain, for any \( \eta \in H^2(S_+^* M_1) \) real valued, that

\[
\left| \int_{S_+^* M_1} I_0(q)(y, \theta) \eta(y, \theta) \, d\sigma^{2n-2} \right| \leq C \|\eta\|_{H^2(S_+^* M_1)} \limsup_{k \to \infty} |\lambda_{1,k} - \lambda_{2,k}|.
\]

Since \( q \in H^1(M_1) \), by the smoothing effect of the normal operator \( N_0 = I_0^* I_0 \) (see (2.21)), \( N_0 q \in H^2(M) \) and

\[
\|N_0(q)\|_{H^2(M_1)} \leq C \|q\|_{H^1(M)} \leq C r'.
\]

Since \( I_0 : H^2(M_1) \to H^2(\partial_+ S M_1) \) is bounded, we can take \( \eta = I_0 N_0(q) \). We integrate with respect to \( y \in \partial M_1 \) the left hand side (5.35) in order to get

\[
\int_{\partial S M_1} I_0(q)(y, \theta) \eta(y, \theta) \, d\sigma^{2n-2} = \int_{M_1} |N_0(q)|^2 \, dv^n = |N_0(q)|^2_{L^2(M_1)}.
\]

Combined with (5.35), this inequality entails

\[
\|N_0(q)\|_{L^2(M_1)}^2 \leq C \|I_0 N_0(q)\|_{H^2(\partial_+ S M_1)} \limsup_{k \to \infty} |\lambda_{1,k} - \lambda_{2,k}|.
\]
On the other hand, it follows from (5.36)
\[ \| \mathcal{I}_0 N_0(q) \|_{H^2(\mathbb{R}^+, SM_1)} \leq C \| N_0(q) \|_{H^2(M_1)} \leq C', \]
the constants $C$ and $C'$ only depend on $M$ and $r$. This (5.37) and (5.38), give
\[ \| N_0(q) \|_{L^2(M_1)}^2 \leq C \limsup_{k \to +\infty} |\lambda_{1,k} - \lambda_{2,k}|, \]
the constant $C$ only depends on $M$ and $r$.

We complete the proof by using the interpolation inequality
\[ \| N_0(q) \|_{H^1(M_1)} \leq C \| N_0(q) \|_{L^2(M_1)}^{\frac{1}{2}} \| N_0(q) \|_{H^2(M_1)}^{\frac{1}{2}} \leq C' \| N_0(q) \|_{L^2(M_1)}^{\frac{1}{2}}, \]
the constants $C$ and $C'$ only depend on $M$, $r$. We then apply (2.20) to get (1.20). □

6. Extension to the Neumann case

We explain in this section how to adapt the preceding analysis to obtain an
uniqueness result for an inverse spectral problem for the Schrödinger operator under
Neumann boundary condition.

For $B = (A, q) \in \mathcal{B}$, define the unbounded self-adjoint operator $\mathcal{H}_B$, acting in
$L^2(M)$ as follows
\[ \mathcal{H}_B u = \mathcal{H}_B u = -\Delta_A u + qu, \quad u \in \mathcal{D}(\mathcal{H}_B), \]
with domain
\[ \mathcal{D}(\mathcal{H}_B) = \left\{ u \in H^1(M), -\Delta_A u + qu \in L^2(M), (\partial_{\nu} + iA(\nu))u|_{\partial M} = 0 \right\}. \]

Fix $B_\ell \in \mathcal{B}_r$, $\ell = 1, 2$ and denote by $(\mu_{\ell,k}, \chi_{\ell,k})$, $k \geq 1$, the eigenvalues and
normalized eigenfunctions of $\mathcal{H}_{B_\ell}$.

We aim in this section to prove the following uniqueness result.

**Theorem 6.1.** Assume that (1.16) and the conditions
\[ \sum_{k=1}^{+\infty} \| \chi_{1,k} - \chi_{2,k} \|_{L^2(\partial M)}^2 < \infty; \]
\[ \lim_{k \to +\infty} k^{-\frac{1}{2}} |\mu_{1,k} - \mu_{2,k}| = 0, \]
are fulfilled. Then $A_1^* = A_2^*$.

Note that, according to Weyl’s formula in [11, page 114], we have that
\[ \lim_{k \to +\infty} k^{-\frac{1}{2}} |\mu_{1,k} - \mu_{2,k}| < \infty. \]
Therefore, condition (6.4) seems to be the optimal rate of growth of the difference
of eigenvalues that guarantee the uniqueness of the magnetic potential.
6.1. Boundary representation formulae for the Neumann problem. For \( g \in H^{1/2}(\partial M) \) and \( \rho(\mathcal{H}_B) \), consider the BVP

\[
\begin{aligned}
(\mathcal{H}_B - \lambda) v &= 0 & \text{in } M, \\
(\partial v + i A v) &= g & \text{on } \partial M.
\end{aligned}
\]  

(6.5)

Similarly to the Dirichlet case, for \( \ell = 1, 2 \), define the N-to-D map

\[ N_{\ell, \lambda} : g \in H^{1/2} (\partial M) \mapsto v_j (\lambda) |_{\partial M}, \]

where \( v_j (\lambda) \in H^2 (M) \) is the solution of the BVP (6.5).

Define, for \( \ell = 1, 2 \),

\[
Q_j (\tau) = \int_{\mathcal{S}_y (M)} (i \lambda \tau) (\partial v + i A v)_1 \beta_1^* + (\partial v + i A v)_1 \beta_1^* ) d\sigma^{n-1} (x)
\]

(6.6)

\[
\begin{aligned}
-2\lambda \int_{\mathcal{S}_y (M)} \int_{\nu, \theta} (\partial A (r, y, \theta ) \tilde{\beta}_1^* \beta_2^* ) \, dr \, d\omega (\theta) - \int_M \beta_1^* H_1 (e^{\beta_2^*}) \, dv^n \\
+ \int_M \left[ (\mathcal{H}_B - \lambda^2)^{-1} (e^{\beta_1^*} \mathcal{H}_A (\partial, q_1 \beta_1^* ) \right] e^{-i \lambda \tau} v_1 (A \nabla \psi) \beta_2^* + H_1 (e^{\beta_2^*}) \, dv^n
\end{aligned}
\]

and

\[
(6.7)
\]

\[
\begin{aligned}
Q_2 (\tau) &= \int_{\mathcal{S}_y (M)} (i \lambda \tau) (\partial v + i A v)_1 \beta_1^* + (\partial v + i A v)_1 \beta_1^* ) d\sigma^{n-1} (x)
\end{aligned}
\]

\[
\begin{aligned}
-2\lambda \int_{\mathcal{S}_y (M)} \int_{\nu, \theta} (\partial A (r, y, \theta ) \tilde{\beta}_1^* \beta_2^* ) \, dr \, d\omega (\theta) - \int_M \beta_1^* H_1 (e^{\beta_2^*}) \, dv^n \\
+ \int_M \left[ (\mathcal{H}_B - \lambda^2)^{-1} e^{i \lambda \tau} (2 \lambda \tau (A \nabla \psi) \beta_1^* + H_1 (e^{\beta_2^*}) \right] \left( e^{-i \lambda \tau} H_1 (e^{\beta_2^*}) \right) \, dv^n
\end{aligned}
\]

(6.8)

Proof. Applying Green’s formula, we get

\[
Q_1 (\tau) = \int_M \text{div} (v_1 (\lambda^2) \nabla A, \varphi^* )_2 \, dv^n
\]

\[
= \int_M \left\langle \nabla A, v_1 (\lambda^2) \nabla A, \varphi^* \right\rangle_g \, dv^n + \int_M v_1 (\lambda^2) \Delta A, \varphi^* \, dv^n
\]

\[
= - \int_M \Delta A, v_1 (\lambda^2) \varphi^* \, dv^n + \int_{\partial M} (\partial v_1 + i A v_1) v_1 (\lambda^2) \varphi^* \, d\sigma_g
\]

(6.9)

\[
+ \int_M v_1 (\lambda^2) \Delta A, \varphi^* \, dv^n
\]

where \( v_1 (\lambda^2) \) the solution of the BVP (6.5), with \( g = (\partial v_1 + i A v_1) \varphi^* \), \( \lambda = \lambda^2 \), \( A = A_1, q = q_1 \). Using the fact that

\[
(\partial v_1 + i A v_1) v_1 (\lambda^2) (x) = g(x) = (\partial v_1 + i A v_1) \varphi^* (x), \quad x \in \partial M,
\]
we deduce that
\[
Q_1(\tau) = \int_M (i\lambda_\tau) \partial_\nu \psi \beta_1^* + i(A_1 \nu) \beta_1^* + \partial_\nu \psi \beta_2^* \Delta(x) \, d\sigma^{n-1}(x)
- \int_M \Delta A_1 v_1(\lambda_\tau^2) \varphi_{2,\tau} M \, dv^n + \int_M v_1(\lambda_\tau^2) \Delta A_1 \varphi_{2,\tau} M \, dv^n.
\]

This identity at hand, we proceed as in Lemma 4.1 to get (6.7). Similar arguments allows us to derive (6.8). □

As for the derivation of (4.40), we obtain from (6.7) and (6.8) the following identity
\[
Q_2(\tau) - Q_1(\tau) = 2\lambda_\tau \int_{\partial M_1} \int_0^{\ell_1(y,\theta)} \mathcal{H}_A(r,\theta) \beta_{1,\tau}^* \beta_{2,\tau} \rho(y,\theta) \, dr \, d\omega_y(\theta)
+ \int_M (q_1 - q_2) \beta_{1,\tau}^* \beta_{2,\tau} \, dv^n(x) - \int_M \beta_{1,\tau}^* (\Delta A_1 \beta_{2,\tau} - \Delta A_2 \beta_{2,\tau}) \, dv^n
- \int_M \left[ (\mathcal{H}_{B_1} - \lambda_\tau^2 - 1) \left( e^{i\lambda_\tau \psi H_{B_1} \beta_1^*} \right) e^{-i\lambda_\tau \psi H_{B_2} \beta_2^*} \right] \, dv^n
+ \int_M \left[ (\mathcal{H}_{B_2} - \lambda_\tau^2 - 1) e^{i\lambda_\tau \psi H_{B_2} \beta_2^*} \right] \left( e^{-i\lambda_\tau \psi H_{B_1} \beta_1^*} \right) \, dv^n,
\]
from which we deduce that, for all \( y \in \partial M_1 \) and all \( \eta \in H^2(S_{y,1}^2 M_1) \),
\[
2i \int_{S_{y,1}^2 M_1} \left( e^{iH_{A_1} y,\theta} - 1 \right) \eta(y,\theta) d\omega_y(\theta) = \lim_{\tau \to +\infty} \frac{Q_2(\tau) - Q_1(\tau)}{\tau}.
\]

The following lemma is needed in the proof of Theorem 6.1.

**Lemma 6.3.** For \( \ell = 1, 2 \), consider \( \varphi_{j,\tau}^* \), \( j = 1, 2 \), given by (4.6). Then, we have
\[
\sup_{\tau > 1} \sum_{k=1}^{\infty} \frac{k^2}{\mu_{\ell,k} - \lambda_\tau^2} \left| \frac{\varphi_{1,\tau}^*, \chi_{\ell,k}}{\mu_{\ell,k} - \lambda_\tau^2} \right|^2 < C|\eta|^2_{H^2(S_{y,1}^2 M_1)} \tau^2,
\]
\[
\sup_{\tau > 1} \sum_{k=1}^{\infty} \frac{k^2}{\mu_{\ell,k} - \lambda_\tau^2} \left| \frac{\varphi_{2,\tau}^*, \chi_{\ell,k}}{\mu_{\ell,k} - \lambda_\tau^2} \right|^2 \leq C\tau^2, \quad \ell = 1, 2
\]
with \( C > 0 \) independent of \( \tau \).

**Proof.** Let \( \tau = \|q_1\|_{L^\infty(M)} + \|q_2\|_{L^\infty(M)} + 1 \) and note that \( D((\mathcal{H}_{B_\ell} + \tau)^{1/2}) = H^1(M) \) since it coincides with the domain of the form associated to the operator \( \mathcal{H}_{B_\ell} + \tau \). Whence, for any \( w \in H^1(M) \), we have
\[
\sum_{k=1}^{\infty} (1 + |\mu_{\ell,k}|) \|w, \chi_{\ell,k}\|_{L^2(M)}^2 \leq C \|w\|_{H^1(M)}^2,
\]
the constant \( C \) only depends on \( \tau, A_\ell, q_\ell \) and \( M \). Combining this estimate with a Weyl’s formula for Neumann magnetic operators, similar to that in Lemma A.1, we get (6.11). □
6.2. End of the proof of Theorem 6.1. The following lemma is useful in the sequel

Lemma 6.4. Let \( g \in H^{1/2}(\partial M) \), \( B \in \mathcal{B} \), \( \lambda \in \rho(\mathcal{H}_B) \) and denote by \( v(\lambda) \) the solution of the BVP (6.5). Then

\[
(6.12) \quad v(\lambda)|_{\partial M} = \sum_{k=1}^{\infty} \frac{\langle g, \chi_k \rangle}{\lambda - \mu_k} \chi_k,
\]

the convergence takes place in \( H^{1/2}(\partial M) \).

In light of this lemma, we have

\[
(6.13) \quad Q_2(\tau) - Q_1(\tau) = \sum_{k=1}^{\infty} \frac{\langle (\partial_\nu + iA_1 \nu)^* \varphi_{2,\tau}^*, \chi_{2,k} \rangle}{\lambda_2^2 - \mu_{2,k}} - \frac{\langle (\partial_\nu + iA_1 \nu)^* \varphi_{2,\tau}^*, \chi_{1,k} \rangle}{\lambda_1^2 - \mu_{1,k}}.
\]

Observe that, according to (1.16), \( A_1 \) can be substituted by \( A_2 \) in the identity above.

On the other hand, we have from (4.6)

\[
(6.14) \quad \| (\partial_\nu + iA_1 \nu)^* \varphi_{1,\tau}^* \|_{L^2(\partial M)} \leq \| \lambda_\tau \| \| (\partial_\nu + iA_1 \nu)^* \beta_1^* \|_{L^2(\partial M)} + \| (\partial_\nu + iA_1 \nu)^* \beta_2^* \|_{L^2(\partial M)} \leq C \tau (1 + \| \eta \|_{H^2(S, M_1)}),
\]

the constant \( C \) being independent of \( \tau \). Thus,

\[
|Q_2(\tau) - Q_1(\tau)| \leq \sum_{k=1}^{\infty} E_k(\tau) + \sum_{k=1}^{\infty} F_k(\tau) + \sum_{k=1}^{\infty} G_k(\tau),
\]

with

\[
E_k(\tau) = \| (\partial_\nu + iA_1 \nu)^* \varphi_{1,\tau}^* \|_{L^2(\partial M)} \| \chi_{2,k} - \chi_{1,k} \|_{L^2(\partial M)} \left| \frac{\langle \chi_{2,k}, (\partial_\nu + iA_1 \nu)^* \varphi_{2,\tau}^* \rangle}{\lambda_2^2 - \mu_{2,k}} \right|,
\]

\[
F_k(\tau) = \| (\partial_\nu + iA_1 \nu)^* \varphi_{2,\tau}^* \|_{L^2(\partial M)} \| \chi_{2,k} - \chi_{1,k} \|_{L^2(\partial M)} \left| \frac{\langle (\partial_\nu + iA_1 \nu)^* \varphi_{2,\tau}^*, \chi_{1,k} \rangle}{\lambda_2^2 - \mu_{2,k}} \right|,
\]

and

\[
G_k(\tau) = \left| \frac{\langle (\partial_\nu + iA_1 \nu)^* \varphi_{1,\tau}^*, \chi_{1,k} \rangle}{\lambda_1^2 - \mu_{1,k}} \right| + \left| \frac{\langle (\partial_\nu + iA_1 \nu)^* \varphi_{2,\tau}^*, \chi_{1,k} \rangle}{\lambda_2^2 - \mu_{2,k}} \right| + C \tau^2 \| \chi_{1,k} - \chi_{2,k} \|_{L^2(\partial M)}^2.
\]
Then it is not hard to check that
the constant $C > 0$ being independent on $\tau$ and $k$.
Noting that
\[
\sup_{\tau > 1} \frac{\tau^2}{|\lambda_{\ell,k}^2 - \mu_{\ell,k}|} < \infty, \quad \ell = 1, 2, \ k \geqslant 1,
\]
we deduce that we have, for all $k \geqslant 1$,
\[
\limsup_{\tau \to +\infty} \tau^{-1} \mathcal{E}_k(\tau) = \limsup_{\tau \to +\infty} \tau^{-1} \mathcal{F}_k(\tau) = \limsup_{\tau \to +\infty} \tau^{-1} \mathcal{G}_k(\tau) = 0.
\]
Then, for any arbitrary integer $n_1 \geqslant 1$, we get
\[
\limsup_{\tau \to +\infty} \tau^{-1} \sum_{k=1}^{\infty} \mathcal{E}_k(\tau) \leqslant \limsup_{\tau \to +\infty} \tau^{-1} \sum_{k=n_1}^{\infty} \mathcal{E}_k(\tau),
\]
\[
\limsup_{\tau \to +\infty} \tau^{-1} \sum_{k=1}^{\infty} \mathcal{F}_k(\tau) \leqslant \limsup_{\tau \to +\infty} \tau^{-1} \sum_{k=n_1}^{\infty} \mathcal{F}_k(\tau),
\]
\[
\limsup_{\tau \to +\infty} \tau^{-1} \sum_{k=1}^{\infty} \mathcal{G}_k(\tau) \leqslant \limsup_{\tau \to +\infty} \tau^{-1} \sum_{k=n_1}^{\infty} \mathcal{G}_k(\tau).
\]
We combine these inequalities, estimates (6.11) and Weyl’s formula in order to get, by repeating the arguments used to prove Lemma 5.2, that
\[
\limsup_{\tau \to +\infty} \left| \frac{Q_2(\tau) - Q_1(\tau)}{\tau} \right| \leqslant C(1 + \|\eta\|_{H^2(S^*_\tau(M))})^2(\limsup_{k \to +\infty} k^{-\frac{n}{2}}|\mu_{k,1} - \mu_{k,2}|).
\]
Then, from (6.4) and (6.10) we deduce that $Z_1 A \in 2\pi\mathbb{Z}$. We proceed similarly to the proof of Theorem 1.2 to get that $A_1^2 = A_2^2$. This completes the proof of Theorem 6.1.

**Appendix A. Weyl’s formula**

We establish some uniform estimates related to the Weyl’s formula of magnetic Schrödinger operators. Our estimates, which are also valid for the Neumann realization of magnetic Schrödinger operators, can be stated as follows.

**Lemma A.1.** Let $B = (A, q) \in \mathcal{B}$. Then there exists a constant $C > 1$, only depending on $M$ and $r \geqslant \|A\|_{L^\infty(M, T \ast M)} + \|q\|_{L^\infty(M)}$ so that
\[
(C^{-1} k^{2/n}) \leqslant 1 + |\lambda_k| \leqslant C k^{2/n}, \quad k \geqslant 1
\]

**Proof.** Let $(\lambda_k)$ be the sequence of eigenvalues, counted according to their multiplicities, of the Laplace-Belrami operator under Dirichlet boundary condition. By Weyl’s asymptotic formula [11, page 114]
\[
\lambda_k = \mathcal{O}(k^\frac{n}{2}), \quad k \geqslant 1
\]
The sesquilinear form associated to $H_B$ is given by
\[
a(u, v) = \int_M \langle \nabla_A u, \nabla_A v \rangle dv^n + \int_M quv dv^n, \quad u, v \in H^1_0(M).
\]
Then it is not hard to check that
\[
a(u, u) \leqslant \|du\|^2_{L^2(M)} + 2\sqrt{r}\|u\|_{L^2(M)}\|du\|_{L^2(M)} + r\|u\|^2_{L^2(M)} \leqslant \frac{3}{2}\|du\|^2_{L^2(M)} + r\|u\|^2_{L^2(M)}
\]
\[ a(u, u) \geq \|du\|_{L^2(M)}^2 - 2\sqrt{r}\|u\|_{L^2(M)}\|du\|_{L^2(M)} - r\|u\|_{L^2(M)}^2 \]
\[ \geq \frac{1}{2}\|du\|_{L^2(M)}^2 - 3r\|u\|_{L^2(M)}^2. \]

We get the expected two-sided inequalities (A.1) by using (A.2) and the minmax principle.

\[ \square \]
