HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Imperfect transcript driven speech recognition

Benjamin Lecouteux, Georges Linarès, Pascal Nocéra, Jean-François Bonastre

Alignment with A* algorithm during asynchronous decoding

- Each evaluated word is aligned to the reference word stream using a Dynamic Time Warping (DTW) algorithm.
- Once the hypothesis is synchronized with the transcript, the algorithm estimates the matching transcript-to-hypothesis score α .
- Then, linguistic probabilities $P(w_i|w_{i-2}, w_{i-3})$ are modified using the following rescoring rule:
$$\tilde{P}(w_i|w_{i-2}, w_{i-3}) = P^{1-\alpha}(w_i|w_{i-2}, w_{i-3})$$
- α is maximum when the trigram is aligned and decreases according to the misalignments of the history.

Alignment example.

Prompter : france inter flash d'informations à huit heures un quart
Pronounced text : france inter l' actualité à huit heures un quart

Results after decoding :

Without alignment : FACE À ELLE actualité à huit heures ET quart
With alignment : france inter l' actualité à huit heures un quart

Experimental context :

- Experiments assessed on 3 hours of radio broadcast
- 10 % WER introduced in transcripts
- Generic language model used : 65000 words trained on "Le Monde"
- Speech recognition system : SPEERAL, an asynchronous decoder based on the A* algorithm.

Results :

- Initial decoding : 22,7% WER using a generic language model.

ML-G : Generic model language 65K words
ML-TrErr : Language model trained on the transcript
alTrEr : Alignment to the imperfect transcript

- Decoding using LM interpolation and alignment.

	WER
ML-TrErr + alignment TrEr	9.9%
ML-G + alignment TrEr	7.7%
ML-G70%+ML-TrEr30%+alTrEr	7.2%
ML-G50%+ML-TrEr50%+alTrEr	7.4%
ML-G30%+ML-TrEr70%+alTrEr	8.6%

- Decoding using language model interpolation.

	Taux d'erreur
ML-TrErr seul	16.3%
ML-G 70% + ML-TrErr 30%	16.2%
ML-G 50% + ML-TrErr 50%	15.4%
ML-G 30% + ML-TrErr 70%	15.2%

Conclusions :

- Best results : interpolation 70-30% with forced alignment to transcript
- WER better than the transcript : 7.2%
- relative improvement : 28%
