HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

REVISITING CONSERVATION LIMITS FOR ATLANTIC SALMON: A NEW RISK BASED DEFINITION

C. Lebot, M.-A. Arago, L. Beaulaton, G. Germis, M. Nevoux, E. Rivot & E. Prévost

Current situation

NASCO Precautionary Approach

Priority to conservation over harvest

Conservation Limits (CL)

Spawning escapement maximizing harvestable surplus (S_{MSY})

Why revisit current CL definition?

CL or Management Target?

- Conservation ≠ Catch maximisation

↓ renewal rate of generations → ↓ CL

- When times become harder for salmon, ambition for conservation should not be lowered

Catch under-report → CL under-estim.

- CLs should not depend on the accuracy of catch knowledge

New risk based definition

A clear and simple definition of conservation: avoid low freshwater juvenile recruitment

New CL:
Nb of spawners ensuring a low probability of low recruitment

Low probability?

Low recruitment?

To be agreed by managers & stakeholders

Application to Brittany

Managers and stakeholders have agreed on new CLs for the 18 main Salmon rivers of Brittany

- Better accounting of various sources of uncertainty
- Fuller assimilation of the diverse sets of data available
