1 Introduction

The use of tariff rate quotas (TRQs) was legitimised ~~and introduced~~ as a market access instrument in the Uruguay Round Agreement on Agriculture (AoA). The motivation behind this instrument was to guarantee minimum levels of market access and to safeguard current levels of access in the face of the high MFN tariffs resulting from tariffication. 1371 TRQs have been notified by 37 countries to the WTO as a result of the Uruguay Round (G/AG/NG/5/7). However, various problems have been identified in the implementation of TRQs (de Gorter and Sheldon, 2000; Skully, 2001). A majority of TRQs are not being filled and thus minimum access commitments are not being met (G/AG/NG/5/7). While there may be market explanations for this lack of demand, there is widespread agreement that quota underfill is in part attributable to the administrative methods employed to implement TRQs. TRQs also generate rents, and the allocation procedures to distribute those rents distort trade and can be subject to political influence (Abbott and Morse, 1999; Abbott, 2001). Thus, whether and in what ways TRQ access should be extended is a subject of some interest in the current negotiations (Matthews and Laroche Dupraz, 2001).

The purpose of this paper is to estimate the value of current TRQ market access to developing countries as a contribution to this debate. The value consists in the new market access which TRQs created (and the export surplus gained on these additional exports) plus the size of quota rents generated which accrue to developing countries. As there is widespread agreement that little new market access was created by TRQs, which were mainly used to maintain existing trade flows, often originating in preferential agreements, this paper concentrates on estimating the value of rents accruing to developing countries. The results are interesting for at least two reasons.

First, because rents accrue as a result of differences between out-of-quota (MFN) tariffs and in-quota tariffs, they indicate the size of potential losses to developing countries arising from the reduction of MFN tariffs. These losses must be offset against the gains which would be obtained from easier access to export markets arising from MFN tariff reductions. Second, the scale of rents accruing to developing countries helps to quantify their possible gains from a further expansion of TRQs in the current Doha Round of multilateral trade negotiations. In a previous article, the

current authors observed that many developing countries are seeking expanded TRQ access in this Round, and in some cases have suggested discriminatory management of TRQs to favour particular groups of countries, e.g. Small Island Developing States (Matthews and Laroche Dupraz, 2001). That article argued that developing countries would be ill-advised to put their limited negotiating capacity behind efforts to improve TRQ access rather than maximising the size of MFN tariff reductions. This article provides quantitative evidence on the importance of existing TRQs to developing countries which allows these arguments to be more critically evaluated.

The article has both methodological and empirical objectives. In Section 2, graphical analysis is used to identify the potential nature of the trading gains from TRQ access under a variety of assumptions regarding the binding nature of the TRQ and the competitiveness of the developing country supplier. This analysis extends the traditional analysis of TRQs by considering not just non-infinitely-elastic supply but also multiple sources of supply with different cost functions. Section 3 applies this analysis to quantify the value of TRQ access to the EU market. A number of different indicators are defined, including the value of the preference margin, the value of rents created, the value of rents appropriated by exporters, and the welfare gain of the rents appropriated by exporters. In each case, the size of these indicators and their distribution of commodity sector and by exporter grouping is quantified and discussed. Section 4 summarises our conclusions and possible directions for further work.

2 Graphical analysis of TRQ effects

This section presents a graphical analysis of the welfare impact of TRQs for exporting countries. It extends the conventional analysis not only by assuming less-than-infinitely elastic supply curves but by explicitly taking multiple sources of supply into account, where these export supply sources have different underlying costs of production. Three situations are considered:

- TRQs are reserved to preferred suppliers, and preferred suppliers are more competitive than others
- TRQs are reserved to preferred suppliers, but preferred suppliers are less competitive than others

- TRQs are open to all suppliers.

In each situation, the impact of TRQs will depend on whether they are binding or not, and whether there are in addition over-quota imports or not. A total of eleven different cases are identified. The focus is on the export surplus and level of rents created in each case. For ease of presentation, it is assumed that any rents created are appropriated by the exporting country. In practice, whether this occurs or not will depend on the way in which the TRQ scheme is managed. We distinguish between two concepts, the preference margin (strictly, the unit preference margin) and the quota rent (strictly, the unit quota rent). The unit preference margin is defined as the difference between the out-of-quota tariff (T) and the in-quota tariff (t). The unit quota rent, where it exists, is the difference between the domestic market price in the importing country (P) and the supply price of the exporting country (p'). The results are summarised in Table 1. There are three key insights from the analysis. First, quota rents are zero where the TRQ is not binding (fill rate less than 100%). Second, only in exceptional circumstances is the quota rent likely to be the same as the preferential margin, and in the majority of cases it is considerably less. Where a quota rent exists, it will be the smaller, the higher the costs of production of preferred suppliers relative to other suppliers. Third, there is one particular case in which the unit quota rent may exceed the unit preference margin but this particular case does not appear to exist in the EU experience which we now come to analyse.

Table 1. Relationship between the unit preferential margin and unit quota rent in different situations

	Rent	Preference margin ($T - t$)
(1) TRQ imports reserved to preferred countries		
(A) Preferred suppliers are more competitive		
a) Preferential TRQ not 100% filled, no over-Q supply	0	No beneficiary
b) Preferential TRQ 100% filled, no over-Q supply	$(P - p') <<$	$(T - t)$
c) Preferential TRQ 100% filled, no MFN supply	$(P - p') >=$	$(T - t)$
d) Preferential TRQ 100% filled, positive MFN supply	$(P - p') <$	$(T - t)$
(B) Preferred suppliers are less competitive		
a) Preferential TRQ not 100% filled, no MFN supply	0	No beneficiary
b) Preferential TRQ 100% filled, no MFN supply (no over-Q supply)	$(P - p') <$	$(T - t)$
c) Preferential TRQ not 100% filled, positive MFN supply	0	No beneficiary
d) Preferential TRQ 100% filled, positive MFN supply	$(P - p') <$	$(T - t)$
(2) No specific allocation of TRQ		
a) TRQ not 100% filled	0	No beneficiary
b) TRQ 100% filled, no over-Q supply	$(P - p') <<$	$(T - t)$
c) TRQ 100% filled, positive over-Q supply	$(P - p') <=$	$(T - t)$

TRQs and rent creation

(1) in-quota imports reserved to preferred countries
A : Preferred supplies are more competitive

(1) in-quota imports reserved to preferred countries
(a) preferential TRQ not 100 % filled, No over- Q supply

- The import price P is determined by the intersection between D and S_i^{PRE}
- At this price, preferential TRQ is not entirely filled by S_i^{PRE}
- No over-quota supply
- No quota rent
- Due to the reduced tariff they enjoy, preferred suppliers benefit from an export surplus (dotted area) which would be smaller in the absence of the additional market access facilitated by the TRQ.

(1) In quota imports reserved to preferred countries
(b) preferential TRQ 100 % filled, No over quota supply

- D_{RES} presents an angle at level of price where S_i^{PRE} reaches the quota Q
- The import price P is determined by the intersection between D and S_i^{PRE} limited by Q
- TRQ entirely filled by S_i^{PRE}
- Preferred suppliers benefit from a quota rent $(P-P') \cdot Q$ (lined area).
- Due to the reduced tariff they enjoy, preferred suppliers benefit from an export surplus (dotted area) which would be smaller in absence of the tariff quota.

<p>(1) In quota imports reserved to preferred countries A : Preferred supplies are more competitive Conclusions</p> <ul style="list-style-type: none"> • If preferential TRQ is entirely filled, there is a quota rent for preferred suppliers, whether MFN supply is positive or not (cases b, c, d). • In general case, the rent unit value $(P - P')$ is smaller than the preference margin $(T - t)$, except in the case where there is an over Q supply from preferred countries but not from MFN countries (case c). • If preferential TRQ is not entirely filled, no rent is created • In all cases, due to the reduced tariff they enjoy, preferred suppliers receive an export surplus which would have been smaller in absence of TRQ.

TRQs and rent creation

(1) in-quota imports reserved to preferred countries

B : Preferred supplies are less competitive

(1) in-quota imports reserved to preferred countries
(a) preferential TRQ not 100% filled, No MFN supply

- The import price P is determined by the intersection between D and S_i^{MFN}
- At this price, preferential TRQ is not entirely filled by S_i^{PRE}
- No over-quota supply
- No quota rent
- An export surplus for S_i^{PRE} (dotted area)

(1) In quota imports reserved to preferred countries
(b) preferential TRQ 100 % filled, No MFN supply

- D_{RES} presents an angle at level of price where S_i^{PRE} reaches the quota Q
- The import price P is determined by the intersection between D and S_i^{MFN} limited by Q
- TRQ entirely filled by S_i^{PRE}
- Preferred suppliers benefit from a quota rent $(P-P') \cdot Q$ (lined area) and from an export surplus (dotted area) where the quota rent is less than the preference margin $(T-t)$.

<p>(1) In quota imports reserved to preferred countries B : Preferred supplies are less competitive Conclusions</p> <ul style="list-style-type: none"> If preferential TRQ is entirely filled, there is a quota rent for preferred suppliers, whether MFN supply is positive or not (cases b, d). If preferential TRQ is not entirely filled, no rent is created; preferred suppliers receive an export surplus which would not have occurred without TRQ (cases a, c). 	
---	--

TRQs and rent creation

(2) No specific allocation of TRQ

We differentiate 2 supplies, S^1 and S^2 , which present differences of competitiveness. We suppose that S^1 is more competitive than S^2 .

(for example, in several cases, S^1 represent the supply of developed countries and S^2 represents the supply of developing countries).

(2) No specific allocation of TRQ
(a) TRQ not 100 % filled

(2) No specific allocation of TRQ (a) TRQ not 100 % filled

- The import price P is determined by the intersection between D and S^{1+2}
- S^{1+2} is not limited by Q ; the TRQ is not entirely filled
- Q_1^1 and Q_1^2 are determined according to the respective competitiveness of S^1 and S^2
- No quota rent
- Due to the reduced tariff they enjoy, in-Q suppliers benefit from an export surplus (dotted and lined areas) which would be smaller in absence of the tariff quota.

(2) No specific allocation of TRQ
(b) TRQ 100 % filled, no over-quota supply

(2) No specific allocation of TRQ (b) TRQ 100 % filled, no over-quota supply

- The import price P is determined by the intersection between D and Q
- S^{1+2} is limited by Q ; the TRQ is entirely filled
- Q_1^1 and Q_1^2 are determined according to the respective competitiveness of S^1 and S^2
- S^1 and S^2 benefit from quota rents (lined areas). The unit value of quota rent is $(P - P')$.
- Due to the reduced tariff they enjoy, in-Q suppliers benefit from an export surplus (yellow areas) which would be smaller in absence of the tariff quota.

<p>(2) No specific allocation of TRQ (c) TRQ 100 % filled, positive over-quota supply</p> <ul style="list-style-type: none"> • S^{1+2} presents i) a first angle at the price level where S_t^2 enters the market, ii) a second angle at the price level where the TRQ is entirely filled, iii) a third angle at the price level where S_t^1 enters the market and iv) a fourth angle at the level of price where S_t^2 enters the market • The import price P is determined by the intersection between D and S^{1+2} • S^{1+2} is limited by Q ; the TRQ is entirely filled • Q_t^1 and Q_t^2 are determined according to the respective competitiveness of S_t^1 and S_t^2 • S_t^1 and S_t^2 benefit from quota rents (lined areas). The unit value of quota rent is $(P - P')$ • Due to the reduced tariff they enjoy, in-Q suppliers benefit from an export surplus which would be smaller in absence of the tariff quota . 	<p>(2) No specific allocation of TRQ Conclusions</p> <ul style="list-style-type: none"> • If preferential TRQ is entirely filled, there is a quota rent for in-Q suppliers (cases b, c, d). • If TRQ is not entirely filled, no rent is created (case a) • In all cases, due to the reduced tariff they enjoy, in-Q suppliers receive an export surplus which would have been smaller in absence of TRQ.

3 TRQ gains in the EU market

The EU has opened 87 separate TRQs arising from the AoA; a description of these TRQs can be found in Matthews and Laroche Dupraz (2002).² EU TRQs are usually defined at the HS8 digit level of the Harmonised System tariff classification.

Table 2 shows the importance of EU trade under these TRQs, in value terms during the period 1997-99, categorised by major commodity groupings. Data on the size of TRQs and the amount of trade under TRQs is supplied by the EU in volume terms based on licence data in its annual returns to the WTO, but these data do not indicate from where imports imported under TRQs originate. To derive the value estimates in

Table 2, two important assumptions are made. The first is that TRQ trade is shared among exporting countries in the same proportion as their shares of the corresponding HS8 tariff line to which the TRQ applies. An exception is made for current access TRQs where bilateral allocations are made to specific countries. It is assumed that these bilateral allocations are first filled before the proportionate rule is applied. Second, it is assumed that the unit value of HS8 trade to which a TRQ applies can also be used to value trade within the TRQ. These assumptions imply that imports entering the EU market under TRQs are broadly representative, in terms of source and quality, of all imports under a HS8 tariff line.^{3 4}

Three indicators of the importance of TRQ trade in total EU agricultural imports are shown in Table 2.⁵ The first is the actual value of imports in the HS8 tariff lines where TRQs have been opened and their importance relative to total

² The quota for rum and taffia, which was added in July 1997 resulting from an agreement between the EU and the USA on spirituous beverages, has not yet been included in this analysis.

³ To the extent that TRQ rents accrue to exporters, the unit value of TRQ imports should be higher than the unit value of non-TRQ HS8 imports by the value of the unit rent which accrues to exporters. As TRQ imports cannot be separately distinguished from non-TRQ imports, the average value of HS8 imports to which this situation applies will be slightly raised, and thus the size of the unit preference margin (defined below) will be under-estimated. The importance of this error will depend on the relative shares of TRQ and non-TRQ imports in individual tariff lines, and in the size of the unit quota rent which the exporter can appropriate.

⁴ A third, more technical assumption is required in some limited cases to apportion TRQ volumes which straddle HS8 tariff lines to those individual tariff lines. This was done on the basis of the relative size of the overall trade in each of the HS8 tariff lines affected.

⁵ Agricultural imports are defined as the sum of HS Chapters 1 to 24 less fish and fish products (Chapter 03). The Agreement on Agriculture in addition covers a small number of additional products in HS Chapters 25 and above which are not included in

Table 2 (see Annex 1, AoA).

imports (shown in Column 3). The drawback of this measure is that, for some of these tariff lines, considerable trade takes place outside the TRQ so that it exaggerates the importance of TRQ trade. A second indicator estimates the potential value of TRQ trade. This is done by multiplying the eligible or maximum TRQ quantities by the unit value of trade in the HS8 tariff line to which they apply (Column 4). The third indicator is similar to the second one, except that notified imports under each TRQ are used instead of the eligible TRQ volumes to measure the actual value of trade (Column 6). The difference between actual and potential imports can be defined as the fill rate (shown in Column 8).

Compared to a total value of EU agricultural imports of ECU 51.3 billion over these years, ECU 8.7 billion were in HS8 tariff lines for which TRQs were opened. The potential value of trade under these TRQs was ECU 6.1 billion, but the actual value averaged ECU 4.9 billion, or a fill rate, defined in value terms, of just over 80%. TRQ trade is most important in the fruit and vegetables sector (reflecting the importance of the banana TRQs allocated to Latin American suppliers), closely followed by the live animals and meat sector and then sugar. TRQs are not significant for trade in tropical products, oils and oilseeds or processed foods nor, except to a very limited extent, for trade in cereals and milling products or dairy products. Actual TRQ trade accounted for just under 10% of all EU food and agricultural imports during this three-year period.

In the context of this paper, what is interesting is the extent to which developing countries have been able to make use of the EU's TRQs. Table 3 shows the distribution of TRQ trade between regions based on the assumptions specified above. Globally, developing countries account for 62% of TRQ trade by value and developed countries for the remaining 38%. This is close to the proportions provided by each region in total EU agricultural imports. In absolute terms, TRQs are most important for developing countries in the fruit and vegetable, meat and sugar sectors. Developing countries make little use of TRQs in the dairy, cereal or processed foods sectors. In regional terms, the value of TRQ trade is most important for Latin American countries, followed by the non-LDC ACP countries (whose TRQ trade is accounted for almost entirely by the beef and sugar protocols under the Lome Convention). It is noteworthy that the least developed countries obtain almost no benefit from TRQs because their exports are concentrated in agricultural products which have low or zero MFN tariffs.

To calculate the rents accruing to developing countries on TRQ trade, the first step is to calculate the preference margin. The results are shown in Table 4, and an example of how the calculation is performed is shown for bananas in Table 5. What is striking is that the estimated preference margin of ECU 4.0 billion is not that much smaller than the value of actual TRQ trade of ECU 4.9 billion in those years; in fact, for some important commodities, the preference margin actually exceeds the value of trade, as the banana example in Table 5 illustrates. The key reason for this is that the unit price received by the exporting countries is smaller than the unit preference margin. The graphical analysis in the previous section showed that rents must exist if the TRQ is binding, as is the case with bananas. Thus these data provide *prima facie* evidence that banana exporters are unable to appropriate the full value of the TRQ rent which arises.

The preference margin represents the absolute maximum potential rent which can be extracted on existing TRQ trade.⁶ Thus it is worth analysing the potential beneficiaries in more detail. Fruit, vegetables and nuts (46.9%), live animals and meat (27.2%) and sugar (12.8%) are the main contributors to the preference margin. Globally, developing countries appear to be the principal potential beneficiaries, accounting for 73% of the total, while developed countries could benefit from the remaining 27%. Among developing countries, Latin American countries would be the largest potential beneficiaries, with 50.5% of the global preference margin, explained by their strong position in the fruit and vegetables and meat sectors. Next in line are the non-LDC ACP countries with 11.1% of the preference margin, but their position is explained totally by their exports of sugar under the Lomé Convention. 10.2% of the global preference margin is attributed to Asian non-LDC countries, concentrated on the fruit and vegetables sector. Other developing countries obtain almost no potential benefit from the operation of TRQs.

The factors influencing the change in the preference margin over the 1997-99 period are shown in Table 6. Logically, the preference margin is the product of the TRQ

⁶ With 100% fill rates, and using the actual TRQ volumes rather than the notified TRQ imports, would give slightly higher estimates of the preference margin. For the three individual years 1997, 1998 and 1999, the potential preference margin would have amounted to ECU 5.4 billion, 4.9 billion and 4.4 billion, respectively, compared to the actual preference margin of ECU 4.4 billion, 4.3 billion and 3.7 billion calculated on the basis of notified imports.

volume, the fill rate and the unit preference margin. Overall, the value of the preference margin has been falling, from ECU 4.4 billion to ECU 3.7 billion. TRQ volumes have, if anything, slightly increased over this period, particularly for meat and dairy products. Fill rates show more volatility. There are many instances where fill rates have fallen, but on average they have increased slightly over the period. Thus the main contributor to the fall in the value of the preference margin is the fall in the unit preference margin, i.e. the difference between the out-of-quota MFN rate and the in-quota rate. This follows directly from the AoA commitments under which MFN tariff bindings are being gradually reduced by an average of 36% over the six-year period 1995-2000. Because this commitment does not apply to the TRQ in-quota rates, the unit value of the preference margin declines.

The preference margin overstates the actual rent created because it makes no allowance for whether a TRQ is binding or not. Where a TRQ is not binding, no rent is created. To allow for statistical and marketing problems, a TRQ is treated as binding if the fill rate exceeds 90%. Based on this rule, the distribution of created rent is shown by commodity sector in Figure 1 and by exporter region in Table 7. The value of rent created by EU TRQs is shown as ECU 2.7 billion, or 67.5% of the value of the preference margin. Most rent is created in the fruit and vegetables sector, followed by live animals and meat and then sugar. For all products together, the share of rent created on exports from developed countries falls to 11.3% (compared to a preference margin share of 27%). The implication is that TRQs are more frequently binding on exports from developing countries than from developed countries. Within the group of developing countries, rent is also more concentrated than the preference margin. 70% of the rent is created on exports from Latin American countries (compared to 50.5% of the preference margin). The share of the rent created by exports from the non-LDC ACP countries increases to 16.4%, compared to 11% for the preference margin. The non-LDC Asian countries now join the other developing country regions whose exports do not create any significant rents.

The final step in estimating the value of EU TRQs to developing countries is to assign these created rents either to importers or to exporters. The division of rents depends on the arrangements made to administer the quotas. These arrangements are

specified in the EC returns to the WTO Committee on Agriculture.⁷ The division of rents proposed for alternative administrative arrangements is an elaboration of a scheme initially suggested by Elbehri et al. (1999), and is shown in Table 8.⁸ Based on these rules, the value of the rents estimated to accrue to developing countries is shown in Table 10. Two observations can be made about this table. First, the value of TRQ rents appropriated by exporters is only 43% of the rents created and only 29% of the value of the preference margin. Second, rents appropriated by exporters are even more concentrated than either rents created or the preference margin. Fully 92% of the exporter-appropriated rents are gained by developing countries, with a value of ECU 1.1 billion. Nearly all of this is accounted for by just two commodity sectors, fruits and vegetables and sugar. Furthermore, 78% accrue to Latin American exporters with a further 19% accruing to the non-LDC ACP group (arising entirely from their Lomé Convention sugar quotas).

The final step in the argument is to consider the sustainability of the trade positions which have emerged under the EU's TRQs. The empirical analysis to this point has implicitly assumed that different countries have similar cost structures and that all export at the average EU unit import price. In fact, there is evidence that exporters taking advantage of TRQs have very different cost structures. As shown in Section 2, this has an important implications for the evaluation of the rents appropriated by exporters. For high-cost exporters, TRQs may be a way of opening market access rather than creating rents. These countries may not be competitive in the absence of the preferential access provided behind high MFN tariffs. The 'rents' appropriated by these countries may simply be absorbed by higher production costs, and the value of TRQ access may be confined to the export surplus value created on these exports. For low-cost exporters, on the other hand, the rents represent an additional transfer to the export surplus earned on their TRQ exports.

⁷ WTO, 14 June 2001, Committee on Agriculture, Addenda to table MA:1 Notifications : General Council Decision, WT/L/384 [G/AG/N/EEC/1, EEC/3, EEC/14 & EEC/15].

⁸ These divisions are subjective and subject to further analysis. For purposes of discussion, we have included Table 9 which shows the rent allocation rule used for each of the individual EU TRQs. Currently, for example, the rents created on the sugar TRQ are divided 50:50 between importer and exporter although CAP rules might indicate that the exporting country can appropriate 100% of the rent.

To gain an indication of the competitive position of TRQ exporters, the FAOSTAT database has been used to calculate for each exporting country and each product the unit export price, defined as the export value divided by the export volume. Each country's unit export price is then compared to the world unit export price for that product (calculated by the same method, and using an average of the 1997-99 period) to determine if the country is a high-cost or low-cost producer of that commodity. Countries are grouped into the regional groupings used in the other tables in this paper and average export prices for broad sectoral commodity groups calculated for each country.⁹ The results are presented in Table 11.

Despite the computational caveats, a number of clear messages emerge from the table. In each case, Latin American unit export prices are below world unit export prices. Latin American countries are clearly competitive exporters to the world market. The rents identified as accruing to them in Table 10 are probably actual rents and they would be in a position to maintain these export flows were trade liberalisation to take place.

On the contrary, for the ACP countries export unit prices for those products where they apparently enjoy a rent transfer (sugar and meat in particular) are above the world unit export prices for those products. It seems reasonable to assume that the rent transfers to these countries are absorbed by higher production costs and thus do not represent a net welfare gain to these economies.¹⁰ The removal of the specific bilateral TRQs from which many of these countries benefit would probably have negative effects on their ability to retain their market shares.

⁹ Measurement problems arise in this exercise. The FAOSTAT product classification corresponds approximately but not exactly with the HS4 classification, and the FAOSTAT country classification does not correspond exactly to the EU's COMEXT trade database. In aggregating countries and products into groups, not all countries export each product and the product composition of a region's exports may be different. The figures shown in Table 11 should be taken as indicative of the relative competitiveness of each region in producing the products shown in the table.

¹⁰ Note that we are using the unit export prices of ACP countries to the world market and not just to the EU in Table 11. It is possible that EU export prices are inflated by the rent transfer, and thus the higher export prices on EU exports would not necessarily imply low competitiveness (see footnote 3). While the use of unit export prices on world exports is intended to mitigate this effect, the exports of many ACP countries are highly concentrated on the EU market, so contamination from this rent transfer effect cannot be ruled out.

Finally, for Asian countries, their export unit values are in general below world unit export values, except for the product group where they are supposed to benefit from a rent (cereals and milling products). The same remarks apply to these countries as to the ACP group.

4 Conclusions

The justification for TRQs in the AoA was that they maintained or created market access in the face of very high MFN tariffs created by tariffication. But TRQs also create rents, and in many cases it is the rent element which becomes the most significant benefit of TRQ access.

The purpose of this paper was to provide a rigorous exposition of rent transfers under TRQs in a world with multiple sources of supply. This analysis enabled us to identify the circumstances under which rents are created and appropriated by developing countries. This analysis was then applied to quantifying the rent transfers created by the EU's TRQ arrangements. Around 10 per cent of the EU's agricultural imports by value enter under TRQ arrangements, and developing countries account for over 60% of these imports. The preference margin on these TRQ imports amounted to ECU 4.0 billion over the period 1997-99, although this value was falling as the tariff reductions mandated under the AoA took effect. This preference margin translates into rent creation only if the TRQ is binding; rent creation was estimated at ECU 2.7 billion over the same period. However, the majority of this rent was appropriated by import agents as a result of the way TRQs are administered in the EU. Only ECU 1.2 billion was appropriated by exporting countries, almost entirely by developing country exporters (ECU 1.1 billion of the total).

Most of this rent transfer accrued to Latin American exporters of fruits and vegetables, while nearly all the remainder accrued to ACP sugar exporters. EU TRQs are irrelevant to least developed countries and to the countries of the Middle East and the Maghreb. They are of limited significance to Asian and ACP non-LDC countries, but these countries do not appear to be competitive enough to benefit from an actual rent transfer in the context of binding TRQs. Instead, the main function of their TRQ

access appears to be to secure a market foothold which otherwise they would have difficulty in maintaining.

The results are relevant to the debate on extending TRQs in the Doha Round of multilateral trade negotiations and to their use as a development instrument. Latin American suppliers of fruits and vegetables (and bananas are the main product in this group) appear to be able to appropriate significant rents from TRQ access, and this might encourage them to seek extensions of this access in the current negotiations. However, their very competitiveness which enables them to appropriate rents means that they would also benefit from further MFN tariff reductions. The fact that TRQ preferences by definition will be temporary as their value will be eroded by successive rounds of MFN tariff reductions argues against spending their limited negotiating capacity in that direction.

The argument for the ACP and, to a lesser extent, Asian economies is slightly different. Extending TRQ access for these countries has the danger that building up markets whose value depends on continued protection would encourage resources in these countries into sectors which are not sustainable in the longer-run. On the other hand, these countries are vulnerable to moves either to reduce or eliminate their preferences or to multilateralise those TRQ quotas from which they currently benefit.

The work in this paper is preliminary and will be further developed in the light of comments at the Workshop. There are a number of possible developments. One would be to distinguish between the importance of current access and minimum access TRQs in contributing to the various rent transfer indicators used in this paper (preference margin, rent creation, rent appropriation). It might be possible to get better information on the distribution of rents between exporters and importers through further discussions with traders or those administering the license arrangements. Another development would be to try to make some estimate of the importance of the export surplus element of TRQ exports relative to the rent transfer element. This would require some assumption on the export supply elasticity of preferred suppliers. While it would be desirable to extend the analysis to other developed countries with significant TRQs, the substantial data work involved may mean this is not possible in the time frame. It is also intended to reduce the emphasis on technical calculation currently in the paper and to develop more the policy implications of the analysis for developing country negotiators.
