HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Abstract

The present 3D Dataset contains the 3D models of the holotype and the paratypes of the new species *Siphonodella leiosa* described and analyzed in the following publication: L. Souquet, C. Corradini, C. Girard: *Siphonodella leiosa* (Conodonts), a new unornamented species from the Tournaisian (lower Carboniferous) of Puech de la Suque (Montagne Noire, France). Geobios, <https://doi.org/10.1016/j.geobios.2020.06.004>.

Keywords: Carboniferous, Conodonts, Holotype, Montagne Noire, Siphonodella

Submitted:2020-03-26, published online:2020-07-21. <https://doi.org/10.18563/journal.m3.115>

Model IDs	Status	Description
UM PSQ 1	Paratype	Dextral P1 element
UM PSQ 2	Holotype	Dextral P1 element
UM PSQ 3	Paratype	Dextral P1 element
UM PSQ 4	Paratype	Dextral P1 element
UM PSQ 5	Paratype	Sinistral P1 element
UM PSQ 6	Paratype	Dextral P1 element
UM PSQ 7	Paratype	Dextral P1 element
UM PSQ 8	Paratype	Sinistral P1 element
UM PSQ 9	Paratype	Dextral P1 element

INTRODUCTION

Siphonodella leiosa is a new species of conodont described in our paper entitled "*Siphonodella leiosa* (Conodonts), a new unornamented species from the Tournaisian (lower Carboniferous) of Puech de la Suque (Montagne Noire, France)" based on a set of P1 buccal elements. The specificity of this species compared to other *Siphonodella* is its unornamented platform. This new discovery reinforces the idea that ornamentation of siphonodelids is related to bathymetry, but also to sea-surface temperature. We discuss the ecological and environmental significance of this new taxon. The 3D models of the holotype (UM PSQ 2) and the paratypes are provided here (Table 1, Fig.1).

METHODS

Digitization of the specimens was performed using an X-ray microtomograph (μ CT) Phoenix nanotomeS on the AniRA-Immos platform of the SFR Biosciences (UMS 3444, ENS Lyon) at a cubic voxel resolution of 1 μ m. The 3D surfaces were extracted semi-automatically within AVIZO 6.3.0 (FEI) using the segmentation threshold selection tool. The 3D surfaces are provided in .ply format, and can therefore be opened with a wide range of freeware.

ACKNOWLEDGEMENTS

We acknowledge the contribution of SFR Biosciences (UMS3444/ CNRS, US8/ Inserm, ENS de Lyon, UCBL) AniRa-ImmOs facility. We particularly thank Mathilde Bouchet for her kind assistance during the scanning sessions. The research was supported by the Project Marcon (Labex CeMEB). This is contribution ISEM 2020-143.
