1. List of abbreviations

1BR3G : Human transformed skin fibroblasts; AcOEt: ethyl acetate; Ag₂O: silver oxide; Al₂O₃ : alumina; APTMS: aminopropyl trimethoxysilane; ARM: atom resolved microscopy; ATR: attenuated total reflectance; BrCH₂COOtBu: tert-butyl bromoacetate; CA: contrast agent; CaCl₂: Calcium chloride; CDCl₃: Deuteriochloroform; CH₂Cl₂: Dichloromethane; CH₃CN: Acetonitrile; -COOH: carboxylic acid function; DBPS : disinfection by-products; DHYD: hydrodynamic diameter; DIAD: Diisopropyl azodicarboxylate; DLS: dynamic light scattering; DMEM: Dulbecco's Modified Eagle Medium; DMF: dimethylformamide; DMSO: dimethylsulfoxide; DOTAGA: 2-(R)-2-(4,7,10-tris(carboxymethyl)-1,4,7,10-tetraazacyclododec-1-yl)pentanedioic acid ; DRIFT: Diffuse reflectance infrared Fourier transform; DTPA: diethylenetriaminepentaacetic acid; EDC: N-(3-Dimethylaminopropyl)-N'-ethylcarbodiimide hydrochloride; EDTA: ethylenediaminetetraacetic acid; EDX: energy dispersion X-Ray analysis; EtOH: ethanol; FT: Fourier Transform; HCl : hydrochloric acid; HCT116: Human colorectal carcinoma cells; HRMS(ESI) : electrospray high resolution mass spectrum; IC₅₀: median inhibitory concentration; ICP-OES: inductively coupled plasma-optical emission spectrometry ; Igepal-CO520: Polyoxyethylene (5) nonylphenylether, branched; IR: infrared; KI: potassium iodide; MCM-48: Mobil Composition of Matter N^o. 48 ; MeOH: methanol; MS (ESI): electrospray mass spectrum; MgSO₄: magnesium sulphate; MRI: magnetic resonance imaging; Na₂CO₃: sodium carbonate; NaBH₄: sodium tetraborohydride; NaHCO₃: sodium hydrogen carbonate; NaOH: sodium hydroxide; NBS: N-bromosuccinimide; NH₂: amino; NH₄OH: ammonia; NP nanoparticle; NMR: nuclear magnetic resonance; NMRD: nuclear magnetic relaxation dispersion; PBS: phosphate buffer solution; PCTA : Pyridine Containing TriAza; 3,6,9,15-tetraazabicyclo[9.3.1]pentadeca-1(15),11,13-triene-3,6,9-triacetic acid ; PDI: polydispersity index; PEG: polyethyleneglycol; PPh₃: triphenylphosphine, SBM: Solomon and Bloembergen model ; Si-DTTA: 3,6,9-Tris(carboxymethyl)-13,13-dimethoxyl-14-oxa-3,6,9-triaza-13-silaphentadecanoic acid ; SiO₂: silica; -Si(OEt)₃ : triethoxysilyl; STEM-HAADF: scanning transmission electron microscopy-high angle annular dark field; sulfo-NHS: N-hydroxysulfosuccinimide sodium salt; TBDPSCl: tert-Butyl(chloro)diphenylsilane; tBu : tert-butyl; TEM: transmission electron microscopy; TESPIC: 3-(triethoxysilyl)propylisocyanate ; THF: tetrahydrofurane; TsCl: Tosyl chloride (toluene sulfonylchloride); ZP: zetapotential.

2. Pure silica NPs (NPSiO₂):

The synthesis of **NPSiO₂** was carried out following the procedure published in a previous publication¹. Depending on the reaction time two sets of NPs could be obtained.

After 24h of reaction, a 10 mL dispersion of the NPs in milliQ water was obtained [NPSiO₂] $\cong$ 3.0 mg.mL⁻¹ (**solution 1**). Their average diameter was 25.9 $\pm$ 4 nm as determined after analyzing TEM images and their Z-average hydrodynamic diameter was 158 nm (PDI 15 %).

Figure ESI 1 : Typical TEM micrograph of **NPSiO₂** (24h) and corresponding size distribution

After 48h of reaction, a 10 mL dispersion of the NPs in milliQ water was obtained [**NPSiO₂**] $\cong$ 2.5 mg.mL⁻¹ (**solution 2**). Their average diameter was 23.2 $\pm$ 3.6 nm as determined after analyzing TEM images and their Z-average hydrodynamic diameter was 104 nm (PDI 16%).

Figure ESI 2 : Typical TEM micrograph of **NPSiO₂** (48h) and corresponding size distribution

3. NH₂ modified silica NPs (NPSiO₂-NH₂) :

Surface functionalisation of **NPSiO₂** was carried out on a batch of **NPSiO₂** (24h, **solution 1** as described above), following a procedure described in ². Typically, 1.6 μ L (9 μ mol) of aminopropyltrimethoxysilane was added to the crude micellar solution which was then stirred for 5 minutes and left to react for 24 hours without supplementary stirring. The particles were washed by centrifugation twice with methanol, twice with ethanol and twice with milliQ water (centrifugation of 9000 rpm, 30 min., 5°C). Typically, a 10 mL dispersion of the NPs in milliQ water was obtained [**NPSiO₂**] $\cong$ 2.5 mg.mL⁻¹. The NPs displayed a grafting density of 2 N/nm² determined on the basis of CHN analysis among which 0.5 N/nm² are readily accessible (based on fluorescence titration using fluorescamine as NH₂ specific reagent ³). Their average diameter was 24.6 $\pm$ 2.7 nm as determined after analyzing TEM images and their Z-average hydrodynamic diameter was 196 nm (PDI 24 %). Prior to the

amidic coupling, 4 batches of NPs were combined (alternatively the process could be scaled up without any change in the characteristics of the NPs), centrifugated and the NPs were washed once with PBS (10mM, pH=7.4), then redispersed in 15mL PBS (**solution 3**: around 100mg of **NPSiO₂-NH₂** corresponding to around 10 μ mol of free NH₂ groups).

4. ^1H et ^{13}C NMR (CDCl_3 , 300 and 75MHz, respectively) of compounds 10 and 12

Figure ESI 4 : ^1H NMR spectrum (300 MHz, D_2O) of free ligand **10**. δ = 7.15 (s, 2H, 2CH, H_4), 4.92 (s, 2H, CH_2 , H_2), 4.56 (s, 4H, 2 CH_2 , H_6), 4.07 (s, 4H, CH_2 , H_7), 3.85 (s, 2H, CH_2 , H_{11}), 3.40-2.70 (m, 8H, 4 CH_2 , H_9 , H_{10}).

Figure ESI 5 : ^{13}C NMR spectrum (75 MHz, D_2O) of free ligand **10**: δ = 171.9 (Cq, C_{12}), 171.6 (Cq, C_8), 171.2 (Cq, C_1), 168.7 (Cq, C_3), 152.7 (Cq, C_5), 109.7 (CH, C_4), 65.6 (CH_2 , C_2), 58.4 (CH_2 , C_6), 56.3 (CH_2 , C_7), 54.4 (CH_2 , C_{11}), 52.42 (CH_2 , C_9), 52.38 (CH_2 , C_{10}).

Figure ESI 6 : ^1H NMR spectrum (300 MHz, D_2O) of free ligand **12**: $\delta=7.15$ (s, 2H, 2CH , H_8), 4.41 (s, 4H, 2CH_2 , H_{10}), 4.23 (t, $J = 6.3$ Hz, 2H, CH_2 , H_6), 4.04 (s, 2H, CH_2 , H_{15}), 3.93 (s, 4H, 2CH_2 , H_{11}), 3.52 (t, $J = 6.5$ Hz, 2H, CH_2 , H_1), 3.23 (s, 8H, 4CH_2 , H_{13} , H_{14}), 1.81 – 1.73 (m, 2H, CH_2 , H_5), 1.51 – 1.31 (m, 6H, 3CH_2 , H_2 , H_3 , H_4).

Figure ESI 7: ^{13}C NMR spectrum (75 MHz, D_2O) of free ligand **12**: $\delta= 173.5$ (Cq, C_{12}), 171.4 (Cq, C_{16}), 170.2 (Cq, C_7), 152.8 (Cq, C_9), 109.9 (CH, C_8), 70.9 (CH_2 , C_6), 61.7 (CH_2 , C_1), 57.7 (CH_2 , C_{10}), 56.3 (CH_2 , C_{11}), 54.6 (CH_2 , C_{15}), 53.5 (CH_2 , C_{13}), 50.8 (CH_2 , C_{14}), 31.1 (CH_2 , C_2), 27.7 (CH_2 , C_5), 24.7 (CH_2 , C_3 or C_4), 24.6 (CH_2 , C_3 or C_4).

5. HRMS (ESI⁺) spectra of Gd-COOH and Gd-OH

Figure ESI 8 : HRMS (ESI⁺) spectrum of Gd-COOH.

Figure ESI 9 : HRMS (ESI⁺) spectrum of Gd-OH.

6. Amidic coupling of between NPSiO_2 and Gd-COOH

Figure ESI 10 : FT-IR (ATR mode) of **Gd-COOH** and of **$\text{NPSiO}_2\text{-NHCO-Gd}$** . Top : full scale ; bottom : enlargement along the y axis to emphasize the weak contribution of the amide bond.

Figure ESI 11 : Typical TEM micrograph of **$\text{NPSiO}_2\text{-NHCO-Gd}$** and corresponding size distribution (scale bar: 200 nm) and corresponding size distribution

Figure ESI 12: left: ARM image of the nanomaterial (scale bar: 20nm), and right: EDX analyses corresponding to the region delineated by the square in the left image.

7. Condensation between NPSiO_2 and Gd-Si(OEt)_3

Figure ESI 13: FT-IR (ATR mode) of Gd-Si(OEt)_3 and of Gd-OH . Due to the presence of two water molecules in the complex, a hump is still observed in the OH region but its relative intensity is much lower than in the Gd-OH complex in agreement with the formation of the urethane bond.

Figure ESI 14: DRIFT spectra of NPSiO₂, NPSiO₂-Gd and NPSiO₂-Gd-PEG

Figure ESI 15 : Typical TEM micrograph of NPSiO₂-Gd and corresponding size distribution

Figure ESI 16 : ARM image of **NPSiO₂-Gd** (left, scale bar : 10nm) and EDX analysis (right) of a region presenting a high concentration of heavy atoms (the weak Fe signal arises from the polar parts of the microscope, Cu, Au, C and O ones from the grid). This region is delineated by a square in the left image.

8. Complementary data on cytotoxicity

Figure ESI 17 : Cytotoxicity studies (viability versus concentration) of a) **NPSiO₂** and b) **NPSiO₂-Gd** ([NPSiO₂-Gd]= 1μg/mL <=> [Gd]= 0.4 μmol/L)
