HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
SHORT RANGE ORDER IN QUENCHED Ni₄Mo

J.-P. CHEVALIER (*) and W. M. STOBBS (**)
Cavendish Laboratory, Cambridge, England

Résumé. — Nous avons étudié l'ordre à courte distance dans un alliage trempé Ni₄Mo.

Abstract. — We have studied Short Range order in quenched Ni₄Mo.

From a detailed electron diffraction study [1] and stereo dark field imaging [2], using the short-range order (SRO) scattering, we have concluded that SRO in this quenched alloy is not of microdomain type. Other workers disagree with this [3]. From these results we suggest a tentative model for SRO in Ni₄Mo. This model is based on a \{1, 1/2, 0\} concentration wave, as proposed by Okamoto and Thomas [1] and by Khachaturyan [2] and de Fontaine [3], from a thermodynamic treatment. We modify the Static Concentration Wave (SCW) of these authors by introducing a localised envelope, producing a Static Concentration Wave Packet (SCWP). This envelope function is given by the Fourier transform of the profile of the SRO scattering. For a Lorencian profile of the SRO peaks (as suggested by de Fontaine [3]), this corresponds to exponential decay of the SCW in real space.

We wish to emphasize that SRO in this alloy is different from that observed in CuPt (e.g. [7]) and it is therefore appropriate to describe SRO in these two alloys in different terms [6]: i.e. the SCWP model for Ni₄Mo and microdomains in CuPt.

Comparison of experimental results, with those expected on the basis of the SCWP model, show good agreement for diffraction and fair, although tentative, agreement with the imaging results. Further work [2] has shown that ageing the quenched alloy at 750 °C and 800 °C leads to the development of LRO through nucleation and growth of domains with the Dla structure.
